ANSWERS.—1. I don't know. When a strange queen is introduced, either because the bees are not quite satisfied with her, or for some other reason, they very often start queen-cells, and when these cells are sealed they sometimes swarm. But if I understand you correctly, these cells were in the hive of the swarm, and they were sealed within a week after the swarm was hived. This could not be, unless you gave a frame of brood to the swarm, in which case cells were probably started at once when the brood was given. Of course, these cells were not started from the egg, but over larvæ already there, and cells being called post-constructed or emergency cells.

2. Very likely they will now settle down to business.

Queenie Jeanette is the title of a pretty song in sheet music size, written by J. C. Wallenmeyer, a musical bee-keeper. The regular price is 40 cents, but to close out the copies we have left, we will mail them at 20 cents each, as long as they last.

The "Old Reliable" seen through New and Unreliable Glasses.
By E. E. HASTY, Sta. B Rural, Toledo, O.

PETS IN THE HOUSEHOLD.

In "The Home Circle," page 457, Prof. Cook talks entrancingly of pets. I wish for our profit to add somewhat thereto. It's a scandal on the human judgment that we do not choose our pets (at least in most cases) instead of so uniformly letting them choose us. At our house the children, with great excitement and glee, drove home from the fields an enormous puppy some one had cast off. Nearly starved to death, poor fellow. Afflicted with a sort of St. Vitus dance, making it impossible to hold him still. No beauty that anyone should desire him. Backbone seems to think dragging on the ground the progression for the mishaps of a dog. He looks a cross of St. Bernard and Dachshund. And now (to share my private troubles with you, brethren) I am disgusted to find that this repulsive, diseased and useless giant is likely to become a permanent member of the household. Professor, can't you train folks a little, in regard to this admirable longing of humanity for pets, so they won't choose *such* pets in such a kind of way?

SWARMS SELECTING THEIR HOMES.

As to how bees select their home in a tree, all theories seem open to strong objection; but the stubborn fact remains that they do select them somehow. John Kennedy, page 459, contributes a novel fact; but I am not sure it gives us much additional light. I mean the case where half a swarm went straight to a hollow tree 60 rods away, and the other half followed five hours later. Apparently those bees, many of them, knew the place before-hand. They seem to have had two young queens, although that is not sure. Testimony about bees being seen frequenting a hollow, and coming to occupy it later, seems to be sufficiently abundant to show that they *sometimes* do so. The above shows no more—in fact does not show at all—the first part of the process. My impression (not a very strong one) has been that swarms *usually* keep moving from place to place until they finally blunder into a place that will answer. Some would consider that the most improbable of the three leading theories. Some hollows are ancient, and have at a previous date been occupied by bees. I suggest that masses of propolis are likely to persist in such hollows even after the moth has cleaned out the comb. Going to such a place for propolis may have familiarized now and then a swarm with the hollow it went to. A hollow, of which the upper end will do for a home, sometimes in spring has water at the bottom. Bees are said to frequent such hollows for water. Like some folks they prefer their water "with a little suthin in it." Shortly before swarming, carrying water is a heavy and constant job employing a great many bees. Anon their favorite supply dries up. Then it would be very natural for them to prospect all the hollows in the attempt to find more, and so get a wide familiarity with hollow trees which would soon come in good play for another purpose.

Taking away queens to make after-swarms go home is practiced to some extent. It is not very satisfactory. You do not know whether there is one queen or more. The supply of young queens at home holds out too long. The hunting often takes too much time when time is precious. And unless you put them back yourself (which you can't do in the frequent cases where you don't know where they came from) they wait too long before they go, and are liable to be alighted on by the next swarm that comes out. In a quite small apiary, however, those objections would be much mitigated.

BEESWAX SPLINTS FOR FOUNDATION.

If I understand C. Davenport, page 461, it's a new kind of splints made out of *beeswax*, and made right on the spot where wanted. Seems to promise being just as good as wooden splints, and easier to put on.

FILE AND STONE BOTTOM-BOARDS.

Tile bottom-boards costing only 10 cents, and that in Cuba! Perhaps a great invention. But will they *fit* tightly? Termites may *drive* me to something of the kind; and I have even been thinking of sawed stone flagging. W. W. Somerford, page 161.

RUSTLER BEES AND AVERAGE BEES.

Anent the two pen pictures of the rustler bees and the average bees, on page 162, I hardly know whether to applaud or scold. Guess I'll scold. It seems to me that where colonies are not queenless, not excessively weak, and nothing special the matter with them, the working of the bees does not differ very greatly—or if it does the keeper needs a thrashing. Mr. Schaeffle, hadn't the heads of those average queens ought to come off—hadn't the heads of their grandmothers ought to have come off long ago?

* The Home Circle. *

Conducted by Prof. A. J. Cook, Claremont, Calif.

WASTE-PAPER BOXES.

Our good friend, that prince of California bee-keepers, J. P. McIntyre, has left his canyon home, which has harbored him and his for near a score of years, and has gone to the city, which in the future is to be honored by having him as a citizen. What could lure him from the restful quiet of that grand canyon, where he has always had Nature at her best, and at first hand? Then, too, his bees, which he loved so well, and has cared for so fondly and so wisely, must be left behind. He and the rippling Sespe must part company. This, at times, was a rapid, roaring, resistless torrent, which then swept grandly by his very door. This grand and no less beautiful environment must have become very dear to all the McIntyres—must have crept in with its refining, elevating influence to make more rugged the honesty, more prompt the sympathy, more pure and high the aspirations towards better

things. How could they leave such environs? Why did they hie away, even though it was to move to a beautiful city by the sea? It was not to change grandeur for grandeur, the close mountains for the equally close ocean, whose surf is ever beating the shore, and whose breakers are ever chasing each other landward, as if tired of their own restless plunging. It was a good purpose—that the dear children might have better school privileges.

Oh! but this love of children is a most blessed thing; though it call for heaviest sacrifice, its call is not in vain, but gladly heard and heeded. Mr. McIntyre, as in all his relations, shows here his good sense and wisdom. Education—the best—is the most precious treasure he can bestow on those lovely girls. To sacrifice, that such treasures may be granted, is the greatest gain. Those fortunate daughters will ever remember it gratefully—the justly proud parents will ever rejoice that they could do this good thing.

Well, I, too, have tasted our friend's kindness. He drove me during the cool evening eastward to meet several of the ranchers in the rich, beautiful "Mound District." And the next morning he accompanied me to look in upon the incomparable begonias of Mrs. Theodosia Shepherd, who by her wonderful skill in breeding plants and developing new varieties, has gained a world-wide reputation. How much pleas-

A PAN-AMERICAN EXPOSITION BUILDING.

ure and health the work has given her, and through it what a wealth of riches has come to the others of us, who look so fondly on what she has so skillfully wrought.

As Mr. McIntyre and I were passing down the street, we saw on the corners neat zinc boxes with an ample slit in the top, *ala* a mail-box. On these is written: "Gift of the Native Daughters;" and all to foster neatness in the town. God be thanked for daughters. I know this thought is often in Mr. McIntyre's mind, and I believe voiced by his lips, as I saw those neat boxes. I said, "God be thanked for the native daughters of Ventura." What a happy suggestion was this. I even went out of my way to pick up a piece of paper that must have blown in from the outside, that I might do my part to keep tidy the streets, and show my appreciation of these fair daughters of fair Ventura. The half-filled boxes, and the neat paper-and rubbish-free streets show full well that the ladies' efforts are not unheeded. This means a whole lot more than clean, tidy streets, it means a toning up of the whole child population of Ventura. Need I limit it to the children? We children of larger growth need just such toning up. If all parents had time and inclination to instruct the children *never* to throw the paper-scrap, the banana peel, or other filth and rubbish, into yard or street, then our walks, paths, streets and yards would be a "joy forever," and not the unkept reservoir for rubbish and rot that so often offend and disgust us in our strolls and rides.

As we parents are too often remiss in this, or else fail to impress our wishes, it is good that such as the Ventura Native Daughters should come to the rescue. May we not all take a hint from them, and go and do likewise? as also do all we may by word and more telling example to aid in this good work of a wholesome cleaning up? Surely, Ventura is happy and fortunate, in having this ever-present reminder—I should have said reminders. For these boxes are very plural—not to throw the litter on walk and street, and to pick up any that more thoughtless, careless hands have cast away to disfigure the landscape.

How many of us, as we see the disgusting scratch of many matches on beautiful walls, or see the scattered matches on floor or walk, rejoice that the fond, eager, loving mother in the long years past, busy though she was almost to the limit often of strength and endurance, yet was not too busy to train us in better and neater ways. The little child that is so taught that it will never mark a wall, never scratch a match where it will mar and disfigure, never cast the refuse paper or fruit-peel where it will offend good taste, has received a lesson that will make it more a lady or gentleman, as it comes to maturity, and more a patriot as it pushes out to fight life's battles. I feel sure that one taught care and thoughtfulness in these matters, will have such respect for law and order that it will take great temptation to move him to join mob or engage in riot. Surely, such teaching must be rife in the fair homes of Ventura. For only from neat homes could come the in-pu-tus that fixed these boxes on the many street-corners of beautiful "Ventura by the Sea."

I wish these words might move others to act for home and city, that we may become a neater people in our home, as also in our suburban life.

PROF. L. H. BAILEY.

And do some of you—not many, I am sure—ask, Who is Prof. L. H. Bailey? Well, he is an old friend and student of mine, who by hard, earnest work has become known the

world over. He is perhaps the most noted and best known horticulturist in the world. He is professor in Cornell University and has written some of the best books on growing and caring for fruits that are to be found. He is also at the head of the great movement in New York State that has succeeded so gloriously in taking "Nature Study" to thousands of children in the rural and city schools. He has inspired the teachers to this same nature study, so that they can interest the children.

And not content with this, he has pushed on to the farmers and has inspired in them a desire to know more and much of nature. So that thousands of them are again in school, so to speak, and are happy in quest of truth as found in study of plant, insect, soil, and rock. This nature study, as carried on in New York, is full of promise. It is making life fuller, brighter and better in thousands and thousands of homes. Prof. Bailey even prepares the leaflets and booklets that are to be used as lesson helps in this grand quest of truth. More still, he either goes or sends some one to schools and homes, to give added help and inspiration in this great and beneficent work. May we not pray that the Lord of the harvest may send more Baileys, and may waken to more nature study every section and State in our beloved country?

I have had Prof. Bailey lecturing with us for two days in the University Extension work in agriculture. It was a great treat to hear him, and the great audiences just hung on his words. Prof. Bailey says his whole life has been turned, brightened and tremendously influenced by a lady teacher, who very early incited him to observe and study the trees. I visited his home while he was but a lad, and was delighted to find him authority on all the birds of his neighborhood. Later it was my delight to be for four years his teacher, and to watch with profoundest joy, his leaps and bounds into the realm of knowledge. Will not the nature-study work, inaugurated in New York by Prof. Bailey, discover to the world other Baileys who will walk in his footsteps, and thus multiply the glad fruit that is sure to come from all such well-directed effort? The home circles in the great Empire State who have tasted of this blessed nature study fruit, may well help to incite other places and States to "go and do likewise."

LAKE IN THE PAN-AMERICAN EXPOSITION GROUNDS.

"The Hum of the Bees in the Apple-Tree Bloom" is the name of the finest bee-keeper's song—words by Hon. Eugene Secor and music by Dr. C. C. Miller. This is thought by some to be the best bee-song yet written by Mr. Secor and Dr. Miller. It is, indeed, a "hummer." We can furnish a single copy of it postpaid, for 10 cents, or 3 copies for 25 cents. Or, we will mail a half-dozen copies of it for sending us one new yearly subscription to the American Bee Journal at \$1.00.

Please send us Names of Bee-Keepers who do not now get the American Bee Journal, and we will send them sample copies. Then you can very likely afterward get their subscriptions, for which work we offer valuable premiums in nearly every number of this journal. You can add much by sending in the names and addresses when writing us on other matters.

ADVERTISEMENT.

To Our Shippers :

We were obliged to notify you a few weeks ago that one Joseph M. McCaul had leased our old quarters at Nos. 120-122 West Broadway, New York City, and had there started up business under the name "HILDRETH, McCaul Co.," and had distributed a multitude of circulars so worded as to create the impression that his business was a successor to or a branch of the business of Hildreth & Segelken.

For the protection of our shippers and ourselves, we at once instructed our attorney to commence action to enjoin the said McCaul from using the name HILDRETH in any manner whatsoever in connection with his business. On the 10th day of July, 1901, Hon. David McAdam, Justice of the Supreme Court of the State of New York, after a full argument upon the merits, issued a peremptory injunction, of which the following is an extract :

"And it appearing that the plaintiffs have for a long time been and now are carrying on business under the style of 'Hildreth & Segelken,' and that the defendant has recently opened a business at 120-122 West Broadway, in the Borough of Manhattan, City of New York, and is carrying on the same under the style of 'Hildreth, McCaul Co.,' and that such act is in violation of the plaintiffs' rights, and that the commission or continuance thereof, during the pendency of this action will produce irreparable injury to the plaintiffs: it is

ORDERED that the defendant (Joseph M. McCaul) and each of his agents, servants and employees and all other persons acting under his authority and direction be, and he and they are hereby restrained and enjoined from showing, displaying or otherwise using during the pendency of this action in or upon any papers, devices, sign or signs, or otherwise, in the business conducted by the defendant at No. 120-122 West Broadway, in the Borough of Manhattan, City of New York, or elsewhere the name of "Hildreth" separately or conjunctively with any other name, designation or description."

Outside of our desire in our own interests to protect the name which we have built by years of satisfactory dealings with our customers, we hastened to procure this injunction as soon as possible, to prevent our shippers from being misled into sending their goods to one who would make an attempt to gain their trade by such a trick and device.

With thanks for the many expressions of good-will we have received from our shippers concerning this attempt to trade under our name, we are,

Sincerely yours,

HILDRETH & SEGELKEN,

265-267 Greenwich Street, NEW YORK, N. Y.

GENERAL ITEMS

A Good, Growing Season.

This has been a very good, growing season here. I feel sorry for such as Dr. Miller and others who have suffered from lack of rainfall. If the Doctor had sent his bees and pasture here last spring I think Nature could have furnished the liquid tonic to have kept them going. White clover was fairly good, and bees worked well on it; basswood the same. Buckwheat is to be heard from. There is a large acreage sown, and as the weather has been congenial for its growth, we may expect a good flow of honey.

M. P. LOWRY.

Armstrong Co., Pa., July 29.

The Outlook in Washington.

All the spring and to the first part of July it was very wet and cold here. All through the clover bloom the bees did nothing more than make a living, although they were very strong in bees, but now they are getting some honey from treweed. I think some of my best colonies have about 50 pounds ready to extract, but I think the honey-flow will be cut short considerably by the forest fires now raging here. The last three days I have been out in the field with several other men fighting fires, and I was surprised to see bees working on the flowers where the smoke was so thick that we could hardly stand it. But even if the bees do work in the smoke, I think it will cut down the yield some.

HANS CHRISTENSEN.

Skagit Co., Wash., Aug. 10.

Don't Make Wild Honey Reports.

I think it is utterly wrong for bee-keepers to make such enormous reports as, "A good year for honey," "Best honey-flow in years," "Heaviest crop ever known," etc. Any man with brains in their proper place can very plainly see that all such reports have a tendency to lower the price of honey, and while some may be quite true, I fear a great many report too early, having a large crop in view, with perhaps two or three dozen colonies of bees kept in a half-way manner, and thus they find themselves minus their honey crop, and buyers don't care to raise the price after it is once down. Hence it is folly to report.

Bee-keepers should put their minds on a level basis, and keep them there. We rarely see a bee-keeper who keeps bees for business making such a whoop, whoop, hurrah boys! It is the still waters that are deep, and where we catch our largest fish. I caught 22 nice ones, Aug. 16.

P. V. STAHLMAN.

Albany Co., N. Y., Aug. 19.

Ancient Ideas of Honey.

I send a clipping which would doubtless interest the readers of the American Bee Journal. We laugh at the assumed knowledge of this educated man of three and a quarter centuries ago; but many of the notions which we cherish and hug to our bosoms at this dawn of the 20th century will appear just as ridiculous to our descendants at its close.

Columbia Co., N. Y. JAMES McNEILL.

The following is the clipping referred to by Mr. McNeill:

HONEY FOR SCHOLARS

"Honey and bread was a great meat with Pythagoras and his Scholars, and counted a suitable food for a temperate life. For bread strengthens the body, and honey both nourishes much and also cleanseth away superfluities. Pollio Plonulus being asked by Augustus the Emperor how he lived so long? By nourishing (saith he) my inwards with

BEST Extracted Honey For Sale

ALL IN 60-POUND TIN CANS.

Alfalfa Honey

This is the famous White Extracted Honey gathered in the great Alfalfa regions of the Central West. It is a splendid honey, and nearly everybody who cares to eat honey at all can't get enough of the Alfalfa extracted.

Basswood Honey

This is the well-known light-colored honey gathered from the rich, nectar-laden basswood blossoms. It has a stronger flavor than Alfalfa, and is preferred by those who like a distinct flavor in their honey.

Prices of Alfalfa or Basswood Honey:

A sample of either, by mail, 10 cents, to pay for package and postage. By freight—two 60-pound cans of Alfalfa, 8 cents per pound; four or more cans, 7½ cents per pound. Basswood Honey, ½ cent more per pound than Alfalfa prices. Cash must accompany each order. You can order half of each kind of honey, if you so desire. The cans are boxed. This is all

ABSOLUTELY PURE HONEY

The finest of their kinds produced in this country.

Read Dr. Miller's Testimony on Alfalfa Honey:

I've just sampled the honey you sent, and it's prime. Thank you. I feel that I'm something of a heretic, to sell several thousand pounds of honey of my own production and then buy honey of you for my own use. But however loyal one ought to be to the honey of his own region, there's no denying the fact that for use in any kind of hot drink, where one prefers the more wholesome honey to sugar, the very excellent quality of alfalfa honey I have received from you is better suited than the honeys of more marked flavor, according to my taste.

McHenry Co., Ill.

C. C. MILLER.

Order the Above Honey and then Sell It.

We would suggest that those bee-keepers who did not produce enough honey for their home demand this year, just order some of the above, and sell it. And others, who want to earn some money, can get this honey and work up a demand for it almost anywhere.

We will mail one of the above queens alone for 75 cents; or 3 for \$2.10.

Please do not conflict the above offer with the one on another page which refers to Red Clover Queens. For sending us one new subscriber at \$1.00, and 25 cts., we will mail you free an Untested Red Clover Italian Queen.

GEORGE W. YORK & CO.

44 & 146 Erie St., CHICAGO, ILL.

Honey, and my onward parts with Ayle. The like answer likewise made Democritus, being demanded the like question. Furthermore, it is so general a Meat through Russia, that the Children eat it on their bread every morning as ours do Butter to their breakfast; with whom, and with Old Men it agreeth exceeding well, cleansing their breasts, opening their pipes, warming their stomachs, resisting putrefaction, and engendering sweet and commendable blood. Raw honey will never grow, therefore clarify it thoroughly at the fire; also let it be honey that ran and was never pulled out of the combs, and of young bees rather than old, feeding upon thyme, rosemary, flowers, and such sweet and wholesome herbs. Then may you boldly give it as meat to young children, to cold and moist complexions, and to rheumatick old men, especially in Northern Countries, and cold climates, and in the winter months.—From DR. THOMAS MUFFETT, 1575.

Poor Season for Bees.

It has been a poor season here this year. What little honey there is of good quality and flavor. It is worth about 20 cents per pound. There is nothing but pollen for the bees to get now, but they seem to be making good use of it, and are rearing lots of young bees.

WM. MARTIN.

Lafayette Co., Wis., Aug. 12.

Dreadfully Dry.

We have had dreadfully hot weather here. The thermometer registered 112 degrees in the shade. It completely dried everything up that the bees could get a drop of nectar from. The weather is much more favorable now.

W. T. STEPHENSON.

Massee Co., Ill., Aug. 13.

Very Short Honey Crop.

In this section of country, with not half a crop of bees to start with last spring, I have taken 230 one-pound sections from six colonies, spring count, and increased to 15, the weather was very dry, and white clover and many other plants yielded almost nothing. I know of but one bee-man that has taken any honey, and he had 50 pounds from 13 colonies. The bee-men here don't take bee-papers—can't afford it, they say. They have just as good pasture and bees, although my bees work on red clover.

What I know about bees I learned from the American Bee Journal. I bought six colonies from one of those fellows that don't read bee-papers. I paid 90 cents per colony for pure Italian bees in 10-frame hives. They worked on red clover for 33 days. I got 15 cents per pound for honey, and have sold 182 pounds, and the rest will be gone in a few days. I sell it right at home. While my crop of honey is not big, I give the good "old reliable" American Bee Journal full credit for my success, and lots of pleasure besides. Without it I, too, would have said, "It don't pay to take bee-papers!" and keep bees.

Hurrah for the American Bee Journal!
Pike Co., Ohio, Aug. 12. J. M. WEST.

An Experience in Bee-Keeping.

Three years ago I sent to a Tennessee firm for four 2-frame nuclei, at \$2.50 each, after being assured that the express charges would not exceed 45 cents apiece; but when they arrived there were \$7.75 express charges on them, and one of them was queenless, and of course died. I never could hear from that firm again, although I wrote several times to them.

The other three nuclei built up strong, and filled the eight brood-frames. They wintered on the summer stands all right, and the next spring, about June 1, they commenced swarming, and they did everlastingly swarm. I was away from home, and my wife, who had had no experience with bees, had her hands full. She succeeded in living six swarms, and she says five or six got away. As a result of excessive swarming the original colonies were reduced so that they did not store much

QUEENS

QUIRIN—THE QUEEN-BREEDER—has now on hand, ready to mail, 500 young, long-tongued Red Clover Queens, Golden or Leather Colored.

We have one of Root's best breeders from his \$20, long-tongued, Red Clover Queen, and a Golden Breeder which we are told is worth \$100, if there is a queen in the U. S. worth that sum.

J. L. Gandy, of Humboldt, Nebr., tells us that the colony having one of his queens, stored over 400 pounds mostly comb honey in a single season. A. L. Root's folks say that our queens are extra fine, while the editor of the American Bee Journal tells us that he has good reports from our stock from time to time.

We have years of experience in mailing and rearing Queens. Queens positively by return mail from now on. Prices for balance of season as follows:

	1	6	12
Selected	\$.75	\$4.00	\$7.00
Tested	1.00	5.00	9.00
Selected tested	1.50	8.00	

Extra selected tested, the best that money can buy, 3.00

honey. We got about 50 pounds of comb honey from the new swarms, but none from the old colonies. Two of the old ones became queenless, and died during the summer. The seven remaining colonies wintered all right on the summer stands, but last season they did nothing. I got no increase and no honey, and they were so light in the fall that I did not expect any of them to survive the winter. I think that fully 50 percent of the bees in this vicinity died during the winter. But by feeding mine pretty liberally during the warmer days of winter and early spring, they all came through in pretty good condition, and notwithstanding the excessive wind, heat, and drouth, my bees have done much better than could have been expected considering the very unfavorable season. They have increased just 100 percent, and most of them are beginning to work in the sufers.

One of the old colonies, I think, is queenless, at least I failed to find any queen, although I may have overlooked her. They have considerable honey and unmated brood, but no newly laid eggs. I found quite a number of old, torn-down queen-cells, but no new ones. H. A. CHENEY.
Barton Co., Kans., July 25.

Drouth and Heat in Iowa.

The drouth and heat have been hard on bees, and I had trouble holding swarms after being bived. I got three swarms from one colony in five days, and they are doing well for the chance they have. The forepart of the season was good, the bees having basswood and white clover to work on. I am in a good location, on the Des Moines river.

W. IRVINE, SR.
Webster Co., Iowa, Aug. 12.

Should Bee-Keepers Encourage Circulation of Bee-Journals?

The Australian Bee-Keepers' Review uses the following good logic:

Some think that the increase of the circulation of the bee-journals is a damage to the business by increasing the number of bee-keepers. I wonder if these good people stopped to think that a man doesn't subscribe for a bee-journal until after he commences keeping bees. It's the ignorant bee-keeper who does most harm to the business, and every new subscriber means the exchange of an ignorant man for one better informed.

The Two Kinds of Queen-Cells.

These cells are called by the Germans *pre-constructed* and *postconstructed*, and were thus designated by Samuel Wagner, the able editor of the American Bee Journal, in the first volume. The two kinds are thus described in Gleanings in Bee-Culture in a Stray Straw:

When bees rear a young queen for swarming or superseding, a cell is built whose bottom is quite different from the bottom of a worker or drone-cell, being smoothly concave like the inside bottom of a teaspoon. The cell is much larger than a worker or drone-cell, its diameter being about 5 1/16 of an inch. Because it is built of this large size *before* it is occupied, it is called a *pre-constructed* queen-cell. After a pre-constructed cell is built out to a certain extent it is called a cell-*cup*, and many cell-cups are started that are never occupied. If a colony becomes queenless when no occupied queen-cells are present, the bees proceed to rear one or several queens from larva in worker-cells. The first change noticed in one of these worker-cells is that the outer part of the cell is enlarged, the walls having the appearance of being pushed apart so as to increase the diameter. Then a

A Superior Red Clover Queen

(AN UNTESTED ITALIAN)

For sending us One New Subscriber and 25 cents (\$1.25 in all.)

We arranged with one of the oldest and best queen-breeders (having many years' experience) to test queens for us this season. His bees average quite a good deal the longest tongues of any yet measured. The breeder he uses is direct from Italy, having imported her himself. Her worker-bees are large, somewhat leather-colored, very gentle, and scarcely requiring veil or smoke. They stored red clover honey last season.

All queens guaranteed to arrive in good condition, and all will be clipped, unless otherwise ordered.

We would like each of our present readers to have one or more of these fine Queens. Simply send us the name and address of a new subscriber for the American Bee Journal for one year, and 25 cents extra, and the Queen will be mailed to you. Our queen-rearers is now caught up with orders, and expects to be able to mail them hereafter within 48 hours after we receive the order. He is in another State, and we will send him the Queen orders as fast as we get them at this office. He is prepared to rear and mail a large number.

The cash prices of these Queens are \$1.00 each; 3 for \$2.70; or 6 for \$5.00. Send all orders to

WALTER S. POWDER.
512 MASS. AVE. INDIANAPOLIS, IND.

hood is built over the cell, and this is built downward to make the full size desired. In the meantime the larva has been lavishly fed so that it is floated out of the narrower part of the cell. Because such a queen-cell is built from a cell after it has been started as a worker-cell and is occupied by a larva, it is called a *postconstructed* cell.

You may not always be able to tell from outside appearance whether a cell is preconstructed or postconstructed, but you can always tell by feeling it down and seeing whether it has a smoothly concave base, or an angular and smaller base like a worker-cell. A preconstructed cell has an egg deposited in it, never a larva at the start. A postconstructed cell is built over a worker-cell containing a larva, although in very rare cases it may contain an egg.

Editor Root thinks it would be better to call them *swarming-cells* and *emergency-cells*. The name *emergency-cells* is entirely appropriate, as applied to cells that are built to meet an emergency, and there is just as much appropriateness in the term *swarming-cells* when such cells are built for swarming. But to use it for cells that are meant for superseding, when there is not the slightest intention of swarming, seems exceedingly inappropriate.

Bees and Alfalfa.

The introduction of alfalfa into Kansas has made the State richer by one million dollars. But the discovery that the honey-bee can feed on alfalfa blossoms has added another million. Bees and alfalfa are an ideal combination. Experiments have been made by raisers of honey-bees and they report most favorably upon the blossom of the alfalfa.

Alfalfa contains a certain degree of sweetness not found in either the sweet clover or white clover. Every stock-breeder knows that in-and-in breeding will cause a deterioration in the strain of stock. Infusions of new life are required to give a new life and vigor to the breed. As it is with animals so it is with plants. Cross-fertilization must take place to keep up the standard. It was once supposed that within each flower are the necessary means for assuring the formation of the embryo within the seed. The truth is that many plants, instead of endeavoring to facilitate self-fertilization, are so constructed as to prevent it. Alfalfa is of this class. The pollen or fertilizing agent must be carried from one blossom and placed where it is needed in another to insure a full crop of seed, and some foreign agency is depended on to accomplish the purpose. In the case of alfalfa, currents of air are unable to carry the pollen and accomplish the cross-fertilization, and most insects do not carry it. Here is where the bee is useful. The alfalfa blossoms offer the bee a sweet drop, and in return for the favor the bee leaves a few grains of pollen, unconsciously brought from another blossom. So the exchange goes on, to the mutual profit of the owner of the alfalfa and the keeper of the bee. Saturday Evening Post.

Cane vs. Beet Sugar.

The authorities tell us that there is no difference between sugar made from beets and that made from sugar-cane. That seems to be the accepted view among the bee-journals of this country. But the British Bee Journal has persistently urged that beet-sugar should not be fed to bees. Because chemical analysis shows no difference, it insists that there is a difference that has its effect on the welfare of the bees to which it is fed. Chemical analysis shows no difference between diamonds and charcoal, but a pound of diamonds would buy a good many pounds of charcoal.

The refined article, in the form of granulated sugar, is the kind universally recommended as best for bees. W. K. Morrison

Langstroth on "The Honey-Bee"

Revised by Dadant—1900 Edition.

This is one of the standard books on bee-culture, and ought to be in the library of every bee-keeper. It is bound substantially in cloth, and contains over 500 pages, being revised by those large, practical bee-keepers, so well-known to all the readers of the American Bee Journal—Chas. Dadant & Son. Each subject is clearly and thoroughly explained, so that by following the instructions of this book one cannot fail to be wonderfully helped on the way to success with bees.

The book we mail for \$1.25, or club it with the American Bee Journal for one year—both for \$1.75; or we will mail it as a premium for sending us THREE NEW subscribers to the Bee Journal for one year, with \$3.00.

This is a splendid chance to get a grand bee-book for a very little money or work.

thinks an article less refined would be better. He says in Gleanings in Bee-Culture:

The best white sugar sold is very highly refined, be it cane-sugar or beet. The bee-men of Europe carefully avoid it because, in the process of refining, it has been robbed of some of its finest constituents.

Here is an analysis of a good quality of highly refined cane-sugar:

	Percent.
Cane-sugar.....	98.00
Glucose.....	1.50
Water.....	1.00
Ash.....	.30
Organic matter.....	.20

Now notice the difference in a sample of muscovado sugar which has not been refined to the same extent:

Cane-sugar.....	\$1.00
Glucose.....	6.00
Water.....	5.50
Ash.....	1.50
Organic matter.....	3.00

Note the difference. The large amount of glucose makes it more agreeable to the bees, and the three percent of organic matter contains flavoring extracts or ethers that give to muscovado sugar its honey-like flavor, so much appreciated by the bees. The first sugar is the best from a chemist's point of view, but from the point of view of a good Italian bee the muscovado is healthier, and nicer to the taste.

I believe that, in this matter, we have been too hasty in following the crowd. American and English housewives buy sugar from its look; but the careful bee-man ought to consider that bees do not judge by looks; and in buying a sugar with a high percentage of natural glucose, he is pleasing the bees and conforming to their wants. For my part I believe the larger the percentage of glucose in sugar the better it is for the bees; and, seeing that it is cheaper than white sugar, why should we not use it?

Barbados makes large quantities of this kind of sugar, which is exported to New York to be refined into white sugar. It is the old-fashioned sugar, but nevertheless a good one for some uses. Jacarosa or palm sugar, would be better still; but it is not easy to get, being mostly produced in India. But any sugar having a high percentage of glucose ought to have the preference, as it is more readily assimilated by bees, being nearer their natural food, and therefore less likely to cause derangement to their intestines, ending in bee-diarthra and perhaps other troubles. There is no trouble in getting all the muscovado sugar that is required, hence the way is plain.

Confining Laying Queens Bad Practice.

That is the opinion of F. Greiner, as expressed with some emphasis in Gleanings in Bee-Culture. He thinks the injury to queens sent by mail is not so much due to the rough handling as to the confinement, and says:

The confinement in the mailing-cages during transit can not well be avoided, as bad as it is; but if to this we add days or possibly weeks of unnecessary confinement in nursery-cages, then good-by queen-business. I for

The Emerson Binder

This Emerson stiff-board Binder with cloth back for the American Bee Journal we mail for but 60 cents; or we will send it with the Bee Journal for one year—both for only \$1.40. It is a fine thing to preserve the copies of the Journal as fast as they are received. If you have this "Emerson" no further binding is necessary.

GEORGE W. YORK & CO.,

144 & 146 Erie Street, CHICAGO, ILL.

one would quickly drop any queen-breeder who stores queens in this wholesale fashion. The only proper place to keep laying-queens is in small colonies; or, if they can be thus safely kept, in separate compartments inside of a hive where they may follow their natural inclination by depositing eggs.

BEE-BOOKS

SENT POSTPAID BY

George W. York & Co.

Chicago.

Bees and Honey, or Management of an Apiary for Pleasure and Profit, by Thomas G. Newman.—It is nicely illustrated, contains 160 pages, beautifully printed in the highest style of the art, and bound in cloth, gold-lettered. Price, in cloth, 75 cents; in paper, 50 cents.

Langstroth on the Honey-Bee, revised by Dadant.—This classic in bee-culture has been entirely re-written, and is fully illustrated. It treats of everything relating to bees and beekeeping. No apiarist's library is complete without this standard work by Rev. L. L. Langstroth—the Father of American Bee-Culture. It has 520 pages, bound in cloth. Price, \$1.25.

Bee-Keepers' Guide, or Manual of the Apispry, by Prof. A. J. Cook, of the Michigan Agricultural College.—This book is not only instructive and helpful as a guide in bee-keeping, but is interesting and thoroughly practical and scientific. It contains a full delineation of the anatomy and physiology of bees. 400 pages, bound in cloth and fully illustrated. Price, \$1.25.

Scientific Queen-Rearing, as Practically Applied, by G. M. Doolittle.—A method by which the very best of queen-bees are reared in perfect accord with Nature's way. Bound in cloth and fully illustrated. Price, \$1.00.

A B C of Bee-Culture, by A. I. Root.—A cyclopaedia of 400 pages, describing everything pertaining to the care of the honey-bees. Contains 300 engravings. It was written especially for beginners. Bound in cloth. Price, \$1.20.

Advanced Bee-Culture, Its Methods and Management, by W. F. Hutchings.—One of the best of this work is a practical and entertaining writer. You should read his book; 90 pages, bound in paper, and illustrated. Price, 50 cents.

Rational Bee-Keeping, by Dr. John Dzierzon.—This is a translation of his latest German book on bee-culture. It has 350 pages, bound in paper covers, \$1.00.

Bienen-Kultur, by Thos. G. Newman.—This is a German translation of the principal portion of the book called "Bees and Honey." 100-page pamphlet. Price, 25 cents.

Bienenzucht und Honiggewinnung, nach der neuesten methode, (German) by J. F. Egner.—This book gives the latest and most approved methods of bee-keeping in an easy, comprehensive style, with illustrations to suit the subject. 50 pages, board cover. Price, 50 cents.

Bee-Keeping for Beginners, by Dr. J. P. H. Brown, of Georgia.—A practical and condense treatise on the honey-bee, giving the best modes of management in order to secure the most profit. 110 pages, bound in paper.

Bee-Keeping for Profit, by Dr. G. L. Tucker.—Revised and enlarged. It details the author's new system, or how to get the largest yields of comb or extracted honey. 50 pages, illustrated. Price, 25 cents.

Apiary Register, by Thomas G. Newman.—Devotes two pages to a colony. Leather binding. Price, for 50 colonies, \$1.00; for 100 colonies, \$1.25.

Dr. Howard's Book on Foul Brood.—Gives the McEvoy Treatment and reviews the experiments of others. Price, 25 cents.

Winter Problem in Bee-Keeping, by G. R. Pierce.—Result of 25 years' experience. 30 cts.

Foul Brood Treatment, by Prof. F. R. Ochsire.—Its Cause and Prevention. Price, 10 cts.

Foul Brood, by A. R. Kohnke.—Origin, Development and Cure. Price, 10 cents.

Capons and Caponizing, by Dr. Sawyer, Fanny Field, and others. Illustrated. All about caponizing fowls and fowls to make the most money in poultry-raising. 64 pages. Price, 20 cts.

Our Poultry Doctor, or Health in the Poultry Yard and How to Cure Sick Fowls, by Fanny Field.—Everything about Poultry Diseases and their Cure. 64 pages. Price, 20 cents.

Poultry for Market and Poultry for Profit, by Fanny Field.—Tells everything about Poultry Business. 64 pages. Price, 20 cents.

HONEY AND BEESWAX

MARKET QUOTATIONS.

CHICAGO, Aug. 22.—White comb brings 15c per pound for the choice grades, with other light not grading No. 1 selling at 13 1/4c; light amber, 12 1/2c; dark, 10 1/2c. Extracted, fair demand at 14 1/2c for white, and 5 1/2c to 5c for amber; dark grades, 5c. Beeswax steady at 24c for choice yellow. R. A. BURNETT & Co.

CINCINNATI, Aug. 10.—The honey market is rather dull on account of the warm weather. Extracted sells only to manufacturers from 50c to 55c; better grades alfalfa water-white from 60c to 70c; white clover from 50c to 55c. Fancy white comb honey sells from 1 1/2c to 1 3/4c.

C. H. W. WEBER.

BOSTON, Aug. 19.—Our market to-day is about 10c to 12c for fancy; A No. 1, 15 1/2c to 16c; No. 1, 14 1/2c. Extracted, full supply, light demand. Several lots of new Vermont honey in cartons have thus far been received, meeting a ready sale at 17c, although of course in a small way. The trade generally seems disposed to hold off, looking for larger receipts and lower prices. This is somewhat due, of course, to the fact that the demand is still light owing to the warm weather. Cooler weather will make a better demand and naturally make a better price.

BLAKE, SCOTT & LEE.

ALBANY, N. Y., Aug. 20.—We quote: Fancy white comb, 10 1/2c; No. 1, 15 1/2c; No. 2, 13 1/2c; mixed, 12 1/2c. Extracted, 14 1/2c; mixed, 6 1/2c to 7c. H. R. WRIGHT.

OMAHA, Aug. 8.—New comb honey is arriving by express in small quantities from Iowa and Colorado, and selling at \$3.50 per case in a retail way. California extracted honey is being offered carlots at 45¢ to 46¢ per pound, f.o.b. California shipping points, but we have not heard of any sales having been made thus far. The production of extracted honey seems to be quite large this year in Colorado, Utah and California. PEYCKE BROS.

NEW YORK, Aug. 7.—There is some demand for new crop of comb honey, and a quite numerous for this time of the year. They have been principally from the South, but we are now beginning to receive shipments from New York State and Pennsylvania. We quote fancy white, 15c; No. 1 white, 13 1/4c; amber, 11 1/2c. No new buckwheat is on the market as yet, and we do not expect any before next month.

Extracted is decidedly dull. Plenty offerings, with only a limited demand, and quotations are rather nominal. We are selling at from 50¢ to 55¢, according to quality, and Southern in barrels from 45¢ to 50¢ per barrel. Beeswax dull and declining; for the present we quote 27 1/2c.

HILDRETH & SIOGELKEN.

DES MOINES, Aug. 7.—There is very little doing here in new crop of honey. Some small lots of near-by produced comb honey are on the market and selling in a retail way at \$3.50 to \$3.75 per case. We do not look for much trade in this line before Sept. 1. Our market does not consume a great deal of extracted honey.

PEYCKE BROS. & CHANEY.

DETROIT, Aug. 12.—Fancy white comb honey, 14 1/2c; No. 1, 13 1/4c; no dark to quote. Extracted, white, 60¢ to 70¢. Beeswax, 26¢ to 28¢. M. H. HUNT & SON.

BUFFALO, Aug. 10.—Quite a good demand for fancy honey, 10 1/2c to 12c, and lower grades, 12 1/2c to 14c. Adverse moderate shipments only of new as yet. BATTERSON & Co.

SAN FRANCISCO, Aug. 14.—White comb, 11 1/2c; 12c; amber, 8 1/2c; dark, 6 1/2c to 7c. Extracted, white, 5 1/2c to 6c; light amber, 4 1/2c to 5c; amber, 4 1/4c. Beeswax, 26¢ to 28¢.

Market continues quiet, with apistars, as a rule, unwilling to move at prices generally named by wholesale operators. Quotations represent as nearly as possible the values ruling at this date for round lots, although few sales could be probably be effected at full figures, while on the other hand, higher prices than quoted are being realized in the filling of some small orders.

KANSAS CITY, Aug. 6.—Some very fine Missouri honey is now on the market, selling at 10c to 15c per pound for fancy white comb. Colorado and Utah shippers are offering new comb honey in carlots for first half of August shipment at 10c per pound for No. 1, and 9 1/2c for No. 2. f.o.b. shipping point. The new crop of extracted honey is as yet rather unsettled, asking prices ranging from 44¢ to 46¢, f.o.b. shipping point. Buyers, however, seem to be in no hurry to make contracts. PEYCKE BROS.

Bee-Keeper's Guide

Or, Manual of the Apiary.

—BY—

PROF. A. J. COOK.

460 Pages—16th (1899) Edition—18th Thou-
sand—\$1.25 postpaid.

A description of the book here is quite unne-
cessary—it is simply the most complete scientific
and practical bee-book published to-day. Fully
illustrated, and all written in the most fascinat-
ing style. The author is also too well-known to
the whole bee-world to require any introduction.
No bee-keeper is fully equipped, or his library
complete, without THE BEE-KEEPER'S GUIDE.

This 16th and latest edition of Prof. Cook's
magnificent book of 460 pages, in neat and sub-
stantial cloth binding, we propose to GIVE AWAY
to our present subscribers, for the work of get-
ting NEW subscribers for the American Bee
Journal.

Given for TWO New Subscribers.

The following offer is made to PRESENT sub-
scribers only, and no premium is also given to
the two NEW subscribers—simply the Bee Journal
for one year:

Send us TWO NEW SUBSCRIBERS to the Bee
Journal (with \$2.00), and we will mail you a copy
of Prof. Cook's book FREE as a premium.
Prof. Cook's book alone sent for \$1.25, or we club
it with the Bee Journal for a year—both for only
\$1.75. But surely anybody can get only TWO
NEW SUBSCRIBERS to the Bee Journal for a year,
and thus get the book as a premium. Let every
body try for it. Will YOU have one?

GEORGE W. YORK & CO.,

144 & 146 Erie Street,

CHICAGO, ILL.

24th Year Dadant's Foundation. 24th Year

We guarantee
satisfaction. **

What more can anybody do? BEAUTY,
PURITY, FIRMNESS, No SAGGING, No
LOSS.
PATENT WEED-PROCESS SHEETING.

Why does it sell
so well? **

Because it has always given better satis-
faction than any other.
Because in 23 years there have not been any
complaints, but thousands of compli-
ments.

Send name for our Catalog, Samples of Foundation and Veil Material.
We sell the best Veils, cotton or silk.

BEE-KEEPERS' SUPPLIES OF ALL KINDS.

Very fine pure-bred BARRED PLYMOUTH ROCK Chickens and Eggs
for sale at very low prices.

Langstroth on the Honey-Bee—Revised,
The classic in Bee-Culture—Price, \$1.25, by mail.

Beeswax wanted at all times.

CHAS. DADANT & SON, Hamilton, Hancock Co., Ill.

Please mention Bee Journal when writing.

ANOTHER ENDORSEMENT

—FOR—

Root's Red Clover Queens

ALEXANDRIA, IND., Aug. 1, 1901.

THE A. I. ROOT CO., Medina, Ohio.

Dear Friends:—The tested clover queen came in good condi-
tion and has filled seven frames with brood two weeks from the
day she arrived, which is better than the combined efforts of three
"yellow" queens purchased two years ago. I believe she is going to
be the counterpart of the queen purchased of you in 1896, in
which case money could not buy her.

Yours Fraternally,

EVAN E. EDWARDS.

PRICES OF RED CLOVER QUEENS:

Gleanings in Bee-Culture one year and Untested Queen\$2.00
" " " " Tested Queen 4.00
" " " " Select Tested Queen 6.00

If you want something good you can not do better than to
order one of these queens. All orders are filled promptly. No
extra postage on these to foreign countries.

THE A. I. ROOT CO., Medina, Ohio.

IMPORTANT NOTICES.

The Subscription Price of this Journal is \$1.00 a year, in the United States, Canada, and Mexico; all other countries in the Postal Union, 50 cents a year extra for postage. Sample copy free.

The Wrapper-Label Date of this paper indicates the end of the month to which your subscription is paid. For instance, "dec 01" on your label shows that it is paid to the end of December, 1901.

Subscription Receipts.—We do not send a receipt for money sent us to pay subscription, but change the date on your wrapper-label, which shows you that the money has been received and duly credited.

Advertising Rates will be given upon application.

National Bee-Keepers' Association

OBJECTS:
To promote and protect the interests of its members.
To prevent the adulteration of honey.
To prosecute dishonest honey-dealers.

BOARD OF DIRECTORS.

E. WHITCOMB,	THOS. G. NEWMAN,
W. Z. HUTCHINSON,	G. M. DOOLITTLE,
A. J. ROOT,	W. F. MARKS,
E. T. ABBOTT,	J. M. HANBAUGH,
P. R. ELWOOD,	C. P. DADANT,
E. H. ROOT,	DR. C. C. MILLER.

EXECUTIVE COMMITTEE.

ERNEST R. ROOT, President.
R. C. AIKIN, Vice-President.
DR. A. B. MASON, Secretary, Toledo, Ohio.

EUGENE SECOR, General Manager and Treasurer, Forest City, Iowa.

MEMBERSHIP DUES, \$1.00 a Year.

If more convenient, Dues may be sent to the office of the American Bee Journal, when they will be forwarded to Mr. Secor, who will mail individual receipts.

A Celluloid Queen-Button is a very pretty thing for a bee-keeper or honey-seller to wear on his coat-lapel. It often serves to interest one in the subject of honey, and frequently leads to a sale.

NOTE.—One reader writes: "I have every reason to believe that it would be a very good idea for every bee-keeper to wear one of the buttons as it will cause people to ask questions about the busy bee, and many a conversation thus started would wind up with the sale of more or less honey; at any rate it would give the bee-keeper a superior opportunity to enlighten many a person in regard to honey and bees."

The picture shown herewith is a reproduction of a motto queen-button that we are furnishing to bee-keepers. It has a pin on the underside to fasten it.

Price, by mail, 6 cents; two for 10 cents; or 6 for 25 cents. Send all orders to the office of the American Bee Journal.

Weekly Budget.

TWO MORE ON THE 1000.—We have two more names to report before the Buffalo convention, which meets next week. We hope the membership will reach the 1000 mark very soon. We have tried to do something toward raising the number to that figure during the past two months. We will not feel that it is our fault if the desired number is not secured within the time mentioned. We still believe that every bee-keeper ought to be a member of the National Association, which has done such excellent work for the benefit of bee-keeping.

The two names to be reported are these:

CHAS. E. KEMP. A. J. STRATTON.

BUFFALO CONVENTION LODGING.—Secretary Mason writes us that he can secure for such, who desire, "a good, nice, clean place to

less the yard including his home were given. His house is one of the finest in the city where he lives, and to protect his property he bought 100x100 feet running from the rear of his house lot to another avenue, and this he has for lawns and apiary. The small, long building seen in the rear is a bee-house with doors in front and rear, which opens as a shade in summer. This is for queen-rearing, etc., as well as honey.

The photograph was taken by Miss Mary E. Bickmore, who is a teacher in the High School in New York City. Bee-culture comes in her line. Mr. Ferry has an observation hive, which is used in schools before the classes.

DANIEL WIRTH's long-tongued five-handed queens—you can hardly afford to let this season pass without trying a few of them. See his advertisement on another page of this number.

DR. A. B. MASON, secretary of the National Bee-Keepers' Association, has declined to act as judge of the apiarian exhibit at the Ohio State Fair, on account of the Fair being

sleep and get your breakfast at Buffalo for 75 cents." He says he can get such places for about 60, if they will apply to him at the convention. If more places are needed, The Dr. Pierce's Free Bureau of Information, at 652 Main Street, will furnish them in such style and at such prices as will be satisfactory, provided they will call for Sydney S. Sleeper, for arrangements have been made to accommodate all on reasonable and satisfactory terms, provided the applicant is not unreasonable in his demands; and the information furnished will be free to all convention members.

THE APIARY of Mr. H. S. FERRY, of Westchester Co., N. Y., appears on our first page this week. At least a portion of one is shown, which gives a pretty good idea of how Mr. Ferry has his neat bee-yards arranged. The surroundings can not be appreciated un-

opened on Sunday. That is the kind of a stand to take. Some Fair managers need to be taught a lesson, and the Doctor has had the courage of his convictions, and let the Ohio Fair managers know that he doesn't countenance Sunday desecration. He will have no part or lot with them. Fairs or expositions that can't succeed without opening on Sunday better "die a-borning."

THE NICKLE PLATE railroad is the one over which Dr. C. C. Miller and the editor of the American Bee Journal will go. The latter expects to leave on Friday evening, Sept. 6, and spend the following Sunday with his mother, about 50 miles south of Cleveland. Dr. Miller will likely leave Chicago Monday, Sept. 9. Mrs. Miller and Mrs. York expect to accompany their respective "partners"—to keep them straight.

ESTABLISHED IN 1861 AMERICAN THE OLDEST BEE-PAPER IN AMERICA BEE JOURNAL

41st YEAR.

CHICAGO, ILL., SEPTEMBER 5, 1901.

No. 36.

* Editorial. *

The Buffalo Convention—next week, beginning Tuesday evening, Sept. 10.

Place—Lecture Room of the Buffalo Library Building, corner of Washington and Clinton Streets.

Question—Will you be there?

Rearing Queens for One's Own Use is the subject of an article in the American Bee-Keeper. The first thing is to select two best queens, one to rear queens from, the other for drones. He greatly prefers the Alley plan for starting cells, not only because it requires less labor, but because there is more danger of getting inferior queens by the Doolittle plan. He gives no reasons in support of this latter view, and it would be nothing strange if he should be asked for something more than a mere assertion.

As to the simplicity of the Alley plan, however, there can hardly be question. One who would make a bungling job of forming cell-cups and transferring larvae might easily succeed by the Alley plan, which in brief is as follows:

Take a piece of comb containing eggs; shave away half the depth of the cells on one side; cut it into strips of one row of cells each; twirl the head of a match in every alternate cell so as to destroy the egg on the shaved side; then dip into melted wax the other side, and fasten it upon the lower edge of a half-depth comb, the edge of the comb being cut rounding so the cells will not be built too close together; and it is ready to be given to the queenless bees.

Honey and Beeswax Market.—The following is offered by Mr. Stoughton Cooley, one who has read this paper for some years:

EDITOR AMERICAN BEE JOURNAL:—

Permit me to offer a criticism of one feature of your very good paper. The general excellence of the paper is such that I would not offer this but for the fact that the fault can be easily corrected.

In the column headed "Honey and Beeswax—Market Quotations," you publish quotations of various dates. In the issue of Aug. 8 appear quotations from Chicago, July 18; Cincinnati, May 17; Boston, June 29; Omaha, May 1; New York, July 8; and so on, winding up with San Francisco, June 19. The criticism I offer is that these quotations should be kept nearer current quotations, and should be from a different source if possible. For instance, the Chicago market has a regular trade bulletin quoting the prices of honey and

wax as sold on South Water Street from day to day. A glance at this paper would enable you to quote prices from a disinterested source, and, if you so wished, on the very day you go to press. The other large cities issue similar trade bulletins, and if they would not exchange with you, a single copy a week would surely not cost much.

I merely offer this as a suggestion for making this column of the American Bee Journal one of great use to bee-keepers, and should like to hear expressions of opinion from other friends of the paper. STOUTON COOLEY.

We wish to thank Mr. Cooley for his suggestion. For some time we have been in the habit of sending out return postal cards every two weeks to those quoting the markets for this paper, and if the report was not changed it was evidence that there had been no change in the market prices for that particular city.

The hint that interested dealers might not furnish as reliable quotations as others, doesn't appeal to our idea of the matter. As practically all who quote in our market column are commission men, it would seem that it would be to their interest to quote as high prices as can be secured, for the more they get for the honey the more will their commission amount to.

Again, those who make a specialty of selling honey ought to be able to secure higher prices than other firms, as they naturally must have a line of customers developed who depend upon them for their honey supply.

The trade bulletin suggestion may be well to investigate. We will do so, and see what the Chicago bulletin has to say about the honey and beeswax market. If as good, or better, service can be secured for bee-keepers in that way, we must have it, as nothing is too good for our subscribers.

We hope our readers will feel free to offer any further suggestions or criticisms they may think valuable. When presented in as courteous a manner as Mr. Cooley has done, they will be welcomed, and acted upon favorably if deemed advisable.

Robbers and Thieves among bees are perhaps generally considered as one and the same thing. W. W. McNeal, in the American Bee-Keeper, calls attention to the fact that they differ greatly, and it is probably true that few bee-keepers suspect the existence of thieves among bees. A robber is one which enters a hive and takes honey by force; a thief takes it by stealth. Robbers prey upon the weaker and queenless colonies, being more especially troublesome in a time of scarcity; thieves find their best foraging ground in the hives of strong colonies at a time when honey is coming in in a flood. There seems to be no way to circumvent this quiet stealing. The practical point in the matter is the danger of

giving credit to a colony for extra-storing ability when that storing comes from thieving; and then breeding from such stock. Some times a colony is found storing when other colonies must be fed; and Editor Hill suggests that it would be a good thing to compare the honey stored by such a colony with the feed given to the others, to see if it might not be the same.

Keeping Over Extra Queens from one season to another, Editor Root thinks, can only be successful by keeping the queens in nuclei in a good cellar.

Pasteboard on Queen-Cages has been in use for some time, the object of the pasteboard being to delay the bees getting at the candy to release the queen. But it has been found that sometimes the bees fail to gnaw the card, and so the queen is not released. The A. I. Root Co., who originated the pasteboard plan, now instruct to tear off the pasteboard in 24 hours, if not already removed by the bees.

Fumigating Section Honey is insisted upon as absolutely essential by some, while others say it is not at all necessary. One thing upon which there can be no disagreement is that it will not do to put upon the market section honey with worms in it. It is possible that the difference in bees has something to do with the difference in experience. A good strain of Italians or hybrids may keep the combs so clean of worms that fumigation may not be necessary. Close watch should be kept by the novice to see whether there be any evidence of worms in the way of a white powder on the edge of the unsealed cells, especially on the bottom part of the section close to the wood. When anything of this kind is to be seen, fumigation should be resorted to at once.

The common plan is to use sulphur, which easily destroys the young larvae, but is less effective against those of larger growth, while it makes no impression at all upon eggs. This makes it necessary to fumigate a second time. Some are enthusiastic as to the use of bi-sulphide of carbon in preference to sulphur, claiming that it kills eggs as well as larvae. So the sections can be fumigated as soon as taken from the bees, or as soon thereafter as may be convenient or desirable, and no further attention will be needed. Another advantage claimed for the bi-sulphide of carbon is that it does not discolor the sections, while too much sulphur will give a coating of green. But care must be taken to avoid having a light come near the bi-sulphide, as it is very explosive.

Contributed Articles.

Hints on Hired Help in the Apiary.

BY HOMER H. HYDE.

TO the bee-keeper who has an extensive system of out-apiaries, or is extensively engaged in queen-rearing, the question of hired help is a very important one. I believe I have had as large experience with hired help as the next man.

It is a very difficult matter to get just the right man, for a great many reasons. The right man is one that is not afraid of stings—one that even when the bees do sting him does not care; one that is thoroughly immune from the poison of the bee-sting. The right man must be industrious, not afraid of work, one that will do as much, according to his ability, when you are away as he will when you are around. He must not object to any kind of work that you may put him to. He should not always be looking to see what time it is, but, on the other hand, should work steadily on until the proper time, and then quit. The best man does not use tobacco in any shape, as it is very injurious, especially to the nerves. The right man will not use intoxicating drinks even in the lightest form. The right man is one that is thoroughly moral, and strictly a gentleman. The best man is an ingenious fellow, one that is quick to learn and will "catch on;" one that when told what and how to do a thing does it just as his employer directs him to do it.

The man who reads will be the most useful. Let me quote the following from W. L. Coggsball:

"The man who reads is the man who succeeds. The young man who does not read never amounts to much in my employ."

I can heartily endorse Mr. Coggsball's views.

The right man is careful, painstaking, one that is ever ready to further his employer's interests.

A man that has all the qualities above enumerated will be a success, and his services will command the highest price.

I once had a man that you could show nothing, and his plan was always the best. He would "mouth around," and half do his work, unless his plan was adopted. He was also a man that when we went out to work considered himself the boss, simply because he was older than I was. He did not seem to realize that while I was much younger in years I was much his superior when it came to bees.

Another man once in our employ was very careless, although industrious; he would scatter things about and lose them. We had to furnish him a new veil about every week, to say nothing of the other tools lost. He also seemed to think that when put on a piece of work it was your business to pitch in and help, no matter what your other duties were.

The owner or manager always has numerous little duties to perform, and numerous little ends to keep up, to say nothing of the management, and it is often necessary to put your men at something while you are attending to these things.

The right man will not want too many days off, and will want to work all his time.

On the side of the employer—he should treat his help fairly and honorably; he should be social and pleasant to all his men; he should treat them right, and so well that he gains their entire confidence, esteem, and respect. Where a man is so treated he will be much more useful, agreeable, and ready to further his employer's interests.

There is very much more that could be said on the subject, which I will leave for some future time.

Williamson Co., Tex.

The Premiums offered this week are well worth working for. Look at them.

The Art of Bottling and Selling Honey.

BY J. C. WALLENMEYER.

HAVING had an experience of eight years in bottling a dozen different kinds of honey in a dozen different kinds of packages or containers, I thought I would give the benefit of my somewhat varied experience to the readers, that they might possibly profit by avoiding the usual mistakes of beginners in using unsalable packages.

I have bottled honey from alfalfa, basswood, willow-herb, white clover, California sage, Florida mangrove, saw and cabbage palmetto, wild aster, and smartweed (or hearts-ease) mixed; dry-weather honey-vine, and fall flowers. For containers I have used pint and quart Masons, costing 50 and 60 cents per dozen; 6 and 8 oz., and 1 and 2 pound square flint-glass jars, costing \$5.70 and \$7.50 per gross (corks included); 13 and 16 oz. jelly-glasses; 1/2-gallon fruit-tablet jars costing 5 cents each; lard-buckets; glass bowls, and Root's No. 25 round flint-glass one-pound jars—quite a variety to select from.

I found Root's No. 25 jar the best and quickest seller of all, because, after being emptied, it could be used as a self-sealer for jelly, preserves, jams, etc.; only flint-glass jars should be used, as they show the honey off to perfection. Amber honey will sell nearly as well in quart Masons on account of the universal use of the package; but it is hard to sell 3 pounds of honey to every-day consumers. Most people prefer a small, cheap package. Our market demands a honey of light or light amber color, heavy body, mild flavor, and fine bouquet or aroma. It does not pay to bottle a poor grade of honey. The people generally get accustomed to the kind of honey produced in their own locality. I found this out to my sorrow when I tried to sell three barrels of mangrove and palmetto honey from Florida, although I thought it fine indeed. This matter of selection is very important. If you happen to run short of honey, and must buy, procure an article as near like your own as possible. I have found that patrons grow suspicious when they get different honey. I find honey from white clover, dry-weather honey-vine, and fall flowers, to give the best satisfaction for bottling, in my locality.

FIG. 1. J. C. WALLENMEYER AND HIS LIQUEFYING APPARATUS.

Briefly stated, there are three essentials for success in bottling honey:

1. Best quality of well-ripened honey.
2. Neat, attractive package, useful when empty.
3. Aggressive selling methods.

You might have the very finest honey, but if it is not put up attractively, it will not sell. You might have a poor article put up in a showy, gaudy, labeled package, but no one will buy a second time. Again, you may have a fine article of heavy body and fine flavor, put up in the right kind of package; but if you leave it at home, what good will it do? Be up-to-date: be aggressive; talk honey everywhere you go. I built up an enormous trade in the fall of 1894 with a well-ripened crop of honey from dry-weather vine and fall flowers. I controlled at that time a large portion of the drug trade in Evansville, and probably half of the grocery trade. I bought 5 barrels of Root's No. 25 1-pound jars, and one gross each of the 5-oz. and 8-oz. square flint Muth jars, and 5 gross of 1-pound, and 3 gross of 2-pound Muth jars, all at one time. I had every kind of package to please the most fastidious. I sold both the 1-pound square and round jars at \$2.00 per dozen, to retail at 20 cents. The 5 barrels of Root's No. 25 jars were gone in a jiffy, while I have nearly all the 5 and 8 oz. jars yet. These I use at fairs to give away as samples. I often sold a dozen of the round jars to housewives who wanted a set for jelly, etc., but never sold more than one or two of the square jars at one time to any lady. They are considered worthless when empty, although my wife likes them for small pickles and catsup. I use the No. 50 label, costing \$1.75 per 1000, for both round and square 1-pound jars. This label is showy, and will not soil easily in dry-time. I find the 2-pound square jar an easy seller to parties who mix their own cough medicine every winter.

I have now dwelt at length on the merits of various packages, as I think it a very important item to help sell our honey. I forgot to say my worst-selling package was the tin lard-bucket, Mr. R. C. Alden notwithstanding. They might be all right to sell to old customers; but the main objection is that people can not see the contents unless it is opened. To get new customers to buy your honey, invest 5 cents in a "glass show-case." As honey is not a staple, instruct the grocer to place conspicuously, and you will have the pleasure of selling both "show-case" and honey at the same time.

HOW TO LIQUEFY; HOW TO WASH THE BOTTLES.

We will now proceed to the process of bottling. Have your honey liquefied, if candied, holding the same at 150 degrees for two or three hours. By using a gasoline stove you can regulate to a degree, almost. Be sure not to over-heat it. It will stand 170 to 180 for a short time, but I prefer not to risk losing the aroma and injuring the delicate flavor. If you are compelled to buy honey, always buy in 60-pound tin cans, as they are more convenient to handle. While you are liquefying your honey, wash your bottles, using clear, soft water with sal-soda and shot to remove dirt and particles of glass if new. Then rinse in clear water, and place bottom upward in racks to drain. This will make flint jars clear and sparkling. I did use a ten-gallon filling-can, bought of Mr. Muth, but now prefer to use my extractor (with cross-arm and basket removed), raised to a convenient height. I prefer to bottle honey hot, as it runs quicker, retains its aroma, and will stay liquid longer than if bottled cold.

Have the rack containing empty jars at your left. Place the pan under the honey-gate to catch any drippings. You will soon learn how to cut off the flow just right the first time. Pass the jar to an assistant at the right, who presses the cork (cost 75 cents per gross) in the mouth, then dips the jar into melted wax and paraffine, half of each. A second assistant puts on the tinfoil (costs 75 cents per gross) in place; winds a capping strap around the jar with the right hand; then holds the jar with the left hand, running the head up and down over the strap until the cap is nicely smoothed down. A pasteboard, about 12x20, covered with dextrine (costs ten cents per pound), is covered with labels in front of the operator. She lays the jar down flat, deftly catches the label by the corner, removes it from the board, attaches it to the center of the jar, smoothing it out with a soft cloth; then she places the jar in the case at the right, holding a dozen each.

After a little practice, three persons can easily fill, cork,

NO. 2.—FILLING THE JARS, AND CAPPING.

wax, tinfoil, label, and pack 800 pounds a day, and not spill a drop of honey, by this method. The corks used for honey-jars are seconds, and ought to be covered with wax to effect an air-tight sealing while the honey is hot.

HOW TO SELL THE BOTTLED GOODS.

Now, then, we are ready to sell. Tog up a bit; for if you will notice you will see that all successful salesmen are well dressed and well groomed. Take a sample jar of each kind, and go to your grocer. If he is busy, see if he has any honey in sight. Don't attempt to sell to him while he is busy. If he is not, tell him you have a fine article of honey, fine flavor, and good body; that the crop of honey is very short this year, and you will not have very much to sell. If you tell him you have five tons he will expect to get it for nothing. Hold your jar to the light; turn it upside down to show how thick it is; talk honey, talk business, and stick right to him. Have one price for everybody. It will pay you to allow a good margin of profit, and he will then try to make more sales than if he made a very small percent of profit. But be sure to have your honey placed where every one can see it on entering the store, as people hardly ever ask for honey unless they see it.

Remember, in conclusion, that he who tooteth not his own horn, the same shall not be tooted.

LIQUEFYING-APPARATUS—SEE FIG. 1.

In presenting a photo of my liquefying-apparatus I have tried to make it conform as nearly as possible to the requirements of the average bee-keeper. Although I usually liquefy on a gasoline range, the cut shows 500 pounds of candied honey liquefying, without interfering with the preparation of meals. Two 60-pound cans are placed in two common wash-boilers, then filled with water, and heated gradually. After all the honey in the can is liquefied it is drawn off into an extractor-can (with the baskets and crank removed), by means of a rubber hose, the can being covered to prevent foreign substances lodging therein. I had a Muth ten-gallon filling-can, but I like the extractor better, as it has a much larger honey-gate, which is very essential in rapid filling. If the honey is cold, the flow can not be cut off a third as fast; therefore with honey at about 140 to 150 degrees Fahr., and a large honey-gate, we attain the maximum of rapidity in filling. Besides, I found, at least in my experience, that in filling with cold honey, a large number of air-bubbles formed, thus preventing our getting the desired amount in the bottles. It would also run over the sides when heated to the right degree.

Of course, no one would attempt to seal until the

bubbles had risen to the surface, which they will do in a few minutes with hot honey. If the honey is then sealed, and either dipped or corks sunk, and any kind of good sealing-wax poured on, thus effecting a hermetical sealing, the honey cants when it gets cold, thus causing the much-talked-of vacuum, especially if a tinfoil cap is properly applied, making it absolutely air-tight.

I found, only the other day [February], 2-pound Muth jars which had been waxed, that candied, while others on the same shelf, sold to the grocer the same day (Oct. 5, 1900), were nice and clear on account of the tinfoil cap. I find that if, after sealing, the jars are left in a warm room, thus preventing the too sudden cooling of the wax on the corks, we shall have no cracks. If one-half paraffine is added to the wax it will not crack nearly as easily, besides being much cheaper.

WASHING THE BOTTLES WITH SHOT.

In regard to the washing of bottles, I had a good laugh over the little boy punching the little pieces of glass out of the bottles, especially new ones. I used to do the same thing. But how much nicer, and far more easy, and quicker, to take about 3 or 4 oz. of No. 6 shot, and the bottle half full of warm soft water! A few shakes, turn the bottle, then pass to helper, who rinses in clean cold water, and we have a clear sparkling jar which is then set upside down in a large tray to drain.

If using jars like the No. 25 and the No. 100, where it is impossible to cover the top with wax, I now pour into each a large tablespoonful of beeswax and paraffine, right on top of the heated honey, which, when cooled, effects the air-tight sealing. This is an additional inducement to my patrons, as they thus secure a nice piece of wax to slick up their irons for laundry work; while, if put on the cork, it prevents the cork from breaking to pieces while being drawn out the first time.

If I am compelled to reliefsy any bottles of honey (which is very rare) I always set the jars in vats of water deep enough to come up to the necks, as I have seen honey scorch in the lower half of a jar while the upper half was yet candied.

I would say in conclusion to those readers who have no honey to bottle, better order a few cans of extracted, and a barrel of the No. 100 or No. 25 jars, and canvass your nearest town. You will be surprised how easy it is to sell a barrel put up in this neat, useful, and attractive package. It pays to work up a trade in a bad season, for, if you sell no honey in a bad season, how can you expect to sell three or four tons when you have not previously worked up a foundation for the disposal of your coming crop?—Gleanings in Bee Culture.

Do Bees Use Water to Cool the Hive?

BY J. A. GEREKDS.

JULY 6 was the hot day in Uvalde County, Texas—100° degrees in the shade and I had a heavy loss of bees on that day by the combs melting, the honey drowning many bees and causing them to be robbed. I have heard of no other loss in the country, and some of the best bee-men have told me it was for the want of water.

I would like to state the particulars of the case in the American Bee Journal, and have the opinion of others on the subject.

I had been running about 200 colonies in one yard until last winter, when I concluded they would do better divided into two apiaries, so, finding a suitable location about 2 miles from the old yard, I cleared the brush off of a piece of ground 150x200 feet. The brush is thick all around, and six or eight feet high. I drilled a well and found water. Then I moved 100 colonies and placed them in two rows, seven feet apart, running north and south

along the east side of the clearing, up close to the brush, leaving a space near the middle of the rows for a honey-house. I built the house so that I can pass through it with the wheelbarrow, and all the time be in between the rows of hives and at the back end of them, as one row fronts east and one west.

The hives are of the lock-corner 10-frame style, some having flat and some gable covers: 70 colonies are on the north of the honey-house and 30 on the south, and 60 of the 70 melted, and I lost 30 of them, while only eight fell of the 30, and I lost four of them, making a loss of 40 colonies, except that I hived the largest swarm I ever saw.

Most of the summer breeze here is from the southeast, so the brush and honey-house kept it from the ones north of the house.

I watered the bees in the yard by letting the water drip from a barrel into a flat trough. The barrel would take about two days to leak dry. I left the apiary July 2, to spend the "4th" in town; I know the bees would be out of water before I returned, but thought it would make no difference, as they had nothing else to do but carry water from the old apiary, which is about 1½ miles on a line from the new one.

I returned July 8, to see a sight I had never dreamed of seeing; the trouble was easily seen. I walked into the honey-house, lit the smoker and put on my veil, and then took a good look before venturing out. The air was so full of bees I could hardly see across the yard. I expected they would drive me off the place, but I stepped out and walked boldly along between the rows. Looking over in front I could see where the little lakes of honey had been the day before. I began to count the wet spots in front, but when I counted ten in succession I concluded all was lost. I looked all about, not knowing what to do. Well, what could I do? To my surprise, the bees offered no objections to my presence, in fact, they did not seem to know I was there. There was a great honey-flow on, and they did not care what I did with them. But what could I do but let them alone?

I looked into four or five hives where the most bees were going in and out; they were so nearly cleaned out that I let them finish the job. Near by I saw about an ordinary wash-tub full of bees settled on a bush near the ground. I thought to hive them, so I went at it just as in swarming-time, only I prepared three boxes instead of one. I put nine combs each in two of them, and an empty one on top for air, and room. They hived nicely. I shaded them well, and left them until the next day, when I gave them about ten pounds of honey in the top box. They seem to be contented now (July 27). That was all I did in that yard for 10 days, when I started in to do my part of the cleaning up.

I was surprised to find honey in some of the robbed

FIG. 3.—LABELING AND TIN-FOILING WITH A CAPPING STRAP (TIN-FOILING SHOWN AT LEFT)

ones, and no bees about them. I could look into the hives with bees in without smoke or veil, leave the top off, and other bees would not go about them. What was the matter? Were they tired, ashamed of themselves, or disgusted with the size of the job? Even now (20 days after) they won't smell around the old, robbed boxes left in the yard—I think because the weather is so dry and hot. There hasn't been a blossom of any kind for nearly two months.

The hives in the old apiary are the same as in the new one—arranged in the same way, two rows running north and south, fronting east and west, with the honey-house at the north end of the rows, with a clean, open ground south and east of them; but no combs melted that I know of.

Now will G. M. Doolittle, Dr. C. C. Miller, Prof. Cook, or any others, tell me if the result would have been different had the bees in the new yard been supplied with water July 6? It was not the first time they had carried water from the old apiary; they knew where it was. I think the surroundings had more to do with it than the water.

Uvalde Co., Tex., July 27.

The In-breeding of Bees.

BY GEO. SHIBER.

NOTICING the editorial on page 355 on the subject of in-breeding, and also having read in the other bee-papers what has been printed on the same subject, prompts me to add a word on the subject.

I have wondered in the years past, since I have been interested in bees, that it has never received consideration by the leading queen-breeders, that is, I suppose it has not, for I have never read anything of it until lately.

For instance, a leading queen-breeder advertised, a year or so ago, that his drones were not akin to his queen-mothers; that new, selected stock was added from time to time to furnish drones. You see, he was constantly selecting choice queen-mothers, and selecting choice drone-mothers, but not akin. A breeder can make some progress in this way, but it seems to me its mighty uncertain. Breeders of all thoroughbred stock tell us that two bloods coming in contact (though of the same breed) produce a shock that tends to stamp out the desirable quality—the bloods do not harmonize where coming in contact.

For illustration, take two queens whose bees are long-tongued, (admitting for argument's sake that long tongues increase the honey crop); choose one for drone-mother, the other for queen-mother. Now, when the queens and drones meet, there will be some that will be as good as their parents, but I should think few, for, from the standpoint of other stock breeders, it would be making progress backward. I would give twice as much for queens reared from a long-tongued mother, and have said queens mated to *her sons*—that would be harmony. Some would be as good as their parents, some would be better, sure—no doubt about that.

Perhaps my bee-keeping friends will think I am speculating too much. Not at all.

Let me call your attention to another kind of stock that I have bred for years as a sort of hobby. I refer to homing pigeons. The great aim with these "couriers of the air" is to breed for speed and long distance. A bird that can fly 500 miles in a day is a prize. Do they in-breed? Well, yes! Father and son, brother and sister, grandfather and granddaughter, and so on. Are they weak and scrawny from such in-breeding? Pick up a bird of mine that I have in mind now, which flew from Hagerstown, Md., (a distance of over 250 miles, air line) to the home loft here; released at 9 a. m., he was back in the loft (home) at 4 p. m. Some days, when he is picked up he feels hard—"hard as nails," as the fanciers say. How was he bred? Why, from a brother and sister. Mind you, this was a hard fly, as he had to come over the Allegheny mountains, diagonally across the State of Pennsylvania. Most of the leading pigeon fliers in-breed; of course this can not be carried on indefinitely; new blood has to be added, gradually, say a quarter, an eighth, or a sixteenth.

In-breeding, you see, tends to harmonize and intensify the two bloods. It is an old saying, if you in-breed stock it would soon decline and weaken. It is no doubt true; but the breeder unmercifully culls his stock. Say one season breed drones and queens together from the same mother; the next season use the same mother for queens. For drones use one of her daughters, she mated to good stock in a different yard. Then her daughter mated to a drone from the first mother of the previous year. Then you have

a small fraction of new blood added, that will tend to give your stock added vigor, and will not affect the desirable qualities of the strain you are building.

I am aware of the fact that this mating of queens is hard to control, but the only thing that can be done is to make the best effort towards that end, until mating of queens in confinement is an assured fact. But not much headway will be gained by the "direct cross" spoken of by some breeders. Why, if it were not for in-breeding we never would have had White Leghorn, Plymouth Rock, Wyandotte hens, or other breeds of "made" stock, so well known by everybody. Take the Buff Leghorn hen—a new breed which was produced by in-breeding, and selection and in-breeding. There are hundreds of other illustrations.

I think this matter would best be left to queen-breeders. I have—and I suppose others have—a dozen or more different strains of Italian blood, in my apiary, but I expect to make more of an effort to rear drones from the same mother I rear queens from.

Questions and Answers.

CONDUCTED BY

DR. C. C. MILLER, Marango, Ill.

(The Questions may be mailed to the Bee Journal office, or to Dr. Miller direct, when he will answer them here. Please do not ask the Doctor to send answers by mail.—Editor.)

Keeping Chickens from Bees—Italians.

1. I have some bees about four rods from the chicken-house. If I clip the queens' wings, would the chickens eat them, when they swarm? They walk around the hives a good deal.

2. If I can't do this, what other method would you advise, to keep swarms from going away?

3. My bees have five yellow bands on them, but to stand far away and look at them they look pretty black. What kind do you think they are? MINNESOTA.

ANSWERS.—1. It is not likely that there would be any trouble.

2. If you should find that the queens were endangered by the chickens, it would be an easy thing to fence the chickens out from the bees, or rather to fence in the bees from the chickens. A fence around the bees, of poultry netting 18 inches high, over which you could easily step, would fence the chickens out. You cannot fence chickens in with such a low fence, but I have used it successfully around flower-beds, and not a chicken would cross it.

3. However dark they may look, the five yellow bands indicate Italian blood.

Two Ways of Putting on Supers.

There are two methods of manipulating supers during a honey-flow in common use, as follows:

First, by raising the supers when partially filled with comb honey, and putting the empty super underneath and directly upon the brood-chamber.

Second, by placing the empty supers on top of the partially filled super or supers, when additional sections are needed.

Which of the above methods do you use? and why?
"OUT WEST."

ANSWER.—Both. When a strong flow is on and there is every reason to expect its continuance, a second super is added as soon as the first is half filled. If the bees seem crowded for room it may be given before the first super is half filled. It is put under the first super, because that will oblige the bees to occupy it promptly, for they can not enter the upper without at least passing through the empty one. If the room seems still to be needed, a third super may be given before either of the first two are finished, and I have had as high as five or six on at a time, and not one of them finished, the last one put on always being the lowest. But it is a risky business to have so many unfinished sections on at a time, for if the flow suddenly stops,

there you are, with the cold chills running down your back at the thought of a big lot of honey on the hives and none of it in marketable condition. If, however, the flow will be accommodating enough to continue till all are finished, there may be a decided gain in having on so many sections, for the bees will have more room to work, and will do the better for it. But never get on so many at a time that all will not be crowded with bees. On the other hand, there is a loss when in a full harvest there are bees enough to crowd two or three supers and only one is on.

Toward the close of the harvest, or at any time when it is doubtful about much more being done, it is often difficult to tell whether another super should be given or not. At such times it is better to put the empty super on top, for the bees will not crowd up into it unless they really need it.

A Glucose Question.

Among other ideas I have had this one: that one reason why bee-keepers opposed the use of glucose is that it is unwholesome, if not injurious, as an article of food.

Dr. Howard Miller, editor of *The Inglenook*, says in the June 15th issue of his magazine, in answer to the question, "Is glucose unhealthy?" asked by one of his readers:

"No. The only thing about it is, it is not as sweet as the sugar it usually takes the place of."

Now, as the editor of *The Inglenook* is pre-eminently a scholar, and you are in addition a practical bee-keeper, and have reason to be thoroughly acquainted with all the properties of glucose, I would like very much to know how you consider it.

MISSOURI.

ANSWER.—Chemically pure glucose is one thing, and the commercial article quite another. However correct the scholarly editor may be in thinking that chemically pure glucose is a wholesome article of diet, if he should get a swallow of some samples of the commercial article, he would be likely, after vainly trying to get the taste out of his mouth, to decide that it was neither fit for man nor bee.

An Amateur's Bunch of Questions.

1. When the honey-flow is plentiful, why do some apiarists place a second super between the brood-chamber and a filled super?

2. I have my colonies on restles, made of 2x3 stuff nailed together in stretcher form, with legs nailed so the hives are about 12 inches from the ground, placing three colonies in a group. What objection is there to this plan? Why?

3. I use a common white table-cloth with smooth or glazed surface on top of sections as a sort of cover or blanket. Is it a good or bad thing to do? What objections can be offered to such use? Why?

4. Does the queen ever leave the hive except at swarming-time?

5. When (at what age) does the virgin queen leave the hive, and how long from the time she mates does she produce eggs?

6. Why do we find more drones in some colonies than in others, although apparently about equal in numbers?

7. Is it possible that a colony will carry over one or more drones during winter?

8. If two colonies with brood-chambers well filled with honey, and supers containing sections with starters, were given 50 pounds of extracted honey, how much would be stored in the sections?

9. How can honey be made more liquid, or thinner, or gravity lessened?

10. What is honey-dew?

INDIANA.

ANSWERS.—1. To give room for the bees to store more honey, of course. Perhaps you mean to ask why they put the empty super under the one partly filled instead of putting it over. Because the bees will begin work in it sooner if the empty super is under instead of over; and because the sections in the filled super may be capped a little whiter when raised up. Perhaps, however, you mean to ask why the empty super is put on at all before the other is finished and taken off. Because after the sections are all filled the bees take some time to finish up the sealing at the outer parts, and it would be a waste of time to wait till the first super can be taken off.

2. In the height of the honey-flow the bees often fall to the ground in front of the hive as they come from the fields heavily laden, and they must rest quite a little time before

they can rise and fly to the entrance. With the hive on a stand near the ground they can crawl in at once without waiting to fly in.

3. I formerly used enameled cloth over the sections, and the bees not only put propolis in the angle where the oil-cloth rested on the sections, but crowded it under the oil-cloth and on the sections. I find the sections less daubed since there is nothing over them but the board cover with a bee-space between.

4. No, not after she begins laying.

5. She makes her bridal trip when about five to eight days old, and begins laying about three days later.

6. In some hives there is little or no drone-comb, so of course few or no drones will be reared, while in other hives a large amount of drone-comb gives opportunity for many drones. A colony with a young queen is not likely to have as many drones as one with an old queen.

7. Yes.

8. I don't know. Some say they can get $\frac{3}{4}$ of it in sections, others say not more than $\frac{1}{4}$.

9. Add water to it.

10. The secretion of plant or scale lice, and also, according to some authorities, an extra-nectarine secretion of plants without the presence of plant or scale lice.

* The Afterthought. *

The "Old Reliable" seen through New and Unreliable Glasses.
By E. E. HASTY, Sta. B Rural, Toledo, O.

SUPERSEDING QUEENS BY RULE.

Procrustes kept a nice lodging-house—leastwise he had an iron bed with chopping-off arrangement and power stretchers attached. Every lodger had to be made to fit the bed, no matter at what cost of blood and groans. Distant cousins of Procrustes are those brethren who supersede every queen at the same exact and early date of her life. She may be good for a month yet, or may be good for three years yet—all the same chop goes the Procrustean bed. Who knows but what the longest-tongued bees in the country have their line terminated by that chop? Mr. Doolittle's way of giving a protected cell, and letting the bees decide whether they want the young queen or the old one, seems to be much the wiser way. Bees show more practical sagacity in such matters than to most of us seems possible. Page 467.

PEAR-BLIGHT AND THE BEES.

It is evidently quite a "peck of half bushels" our cause is getting into in California about the pear-blight. If the fruit-men not only have assurance that the saint might have stolen the horse, but star testimony that the horse won't let sinners ride him under any circumstances, why then the case begins to look a little dark for the saint. Ernest Root is evidently sound, that there must be more evidence than one scientist as to the impossibility of blight traveling on the wind. The fact that extensive young orchards which have never bloomed yet are as badly infected as any is a tower of strength to us which we should make the most of. I'll venture the guess that the smallest size of bark-louse-eating birds do most of the infection—getting the infected viscous on their feet, and leaving some wherever they go in search of little insects. Prof. Cook's opinion, expressed on page 516, is important. He feels sure that there will be plenty of means whereby infection will be carried, even after the removal of the bees—and without calling on the wind, either. Leastwise let us not "get off the earth" with any needless haste. Possibly a little silent inertia will do us good—let the other fellow do nine-tenths of the talking, and most of the acting. Perchance most of this is merely a cloud, and it is the tendency of clouds to roll by. Page 468.

QUEEN SUPERSESSIONS AND LINDEN BLOOM.

Three-quarters of all supersessions within three weeks of the close of the linden. I wonder how widely that is true in other yards than Mr. Doolittle's. Perhaps where there is no linden the last strong flow of the season would be its equivalent. In my yard I "kind of think" that more than the remaining one-quarter occur in swarming-time just before the linden. I may be quite wrong—only go by my guess as to how many prime swarms have virgin queens. I suppose the general principle is that when bees are rearing little brood,

and want but little, they are much more patient with a declining queen than when everything is on the boom. Probably linden would have no relation to the matter where there is only a tree or two of linden—or no flow from a larger number of trees. And also in a very bad year (I think we have heard) queens live over, and supersessions come in a pile next year. Page 467.

DIDN'T SELECT THIS HOME BEFORE SWARMING.

Yes, Mr. Hobbs, the swarm that flies seven miles, two miles of it through timber containing numerous good homes, and locates finally in a cavity not fit to winter in— they manifestly didn't select their home before swarming. Page 475.

"MAKING" NATURAL SWARMS.

The imitation of natural swarming given by Doolittle on page 478 may be quite valuable. Very little things oft turn the scale between failure and success, and the 1/4 hour spent homeless and clustered like a swarm may be one of them. The crucial point, of course, is whether the bees in a body actually do stay put, or whether a large fraction of them return to the old stand. Not unwise to hold the thing as an experiment until many brethren have had continued success in making all the bees stay.

* The Home Circle. *

Conducted by Prof. A. J. Cook, Claremont, Calif.

OUR SOCIAL LIFE.

The Good Book is well named—The Bible—which means "the book." It is the book. The other name—the Gospel—means "good news." And it is good news, indeed. It always advises us rightly and so, of course, wisely. How good to have a friend, ever close at our elbow, that will ever have the wisdom and the interested sympathy always to advise us aright. Many of us have been thus blessed in our life companions. How well we have learned our good fortune and our blessing.

The dear, old Bible may be just such a treasured friend to every one. It, like its author, is too wise to err, too good to be unkind. This dear old volume says that he that neglects those of his own household is worse than an infidel. It is suggestive, as it puts action ahead of belief. I suppose for the same reason that James, in his epistle, exhorts works. Our actions bespeak the heart's status. Ever to ask aright means ever to be right. I am glad that the precious old book exalts the home love. The home at its best, where all the heart-throbs are true, and all the life sympathies are quick and responsive, where each truly holds other better than himself, and is happiest in ministrations—such a home is earth's dearest and best boon. It is one of the things most to be sought after—and, when won, most to be prized.

But the dear old book does not stop there. It urges us not to forget to assemble ourselves together. It is our blessed privilege, no less than our sacred duty, to give our first thought and best love to home and its members. If that home is what it should be, and rightly influences us, as it ought and will, then it will never fence in our love to keep it all to itself. It will so touch life with the spirit of sweet helpfulness that all in the home will reach out to bless and help those of other homes.

It was my good fortune to be in Columbus, Ohio, when our beloved and martyred president, James A. Garfield, was elected to the United States Senate. I heard his speech as he responded to the notification of his great, good fortune. He said, in short, that it had given him pleasure, when he had been so fortunate as to act in a way to meet the approval of his countrymen the country over. It brought a deeper gratification to know that he pleased the people of his own State—Ohio. He was yet more pleased at the applause of those of his own district, and the heart-beats were stirred more at the plaudits of those of his own home, his very neighbors. A still keener relish greeted the approval of the dear ones of his own home circle, and the best satisfaction of all came when he wholly pleased James A. Garfield. I suppose it is the best satisfaction, when our own consciences say without let or hindrance, "Well done."

So in our ministrations. Our greatest duty is to ourselves. We can never give to our best friends so dear a gift as our

own best manhood. Next we should reserve our most beneficent thought and bestowments for the home circle. No man can give his best to his neighbors who has not already given better thought and attention to his very own loved ones.

Next, the arms of our love should encircle our neighbors. The man who does not gild the pathways of his own town with acts of thoughtful, unselfish love, which attracts all to him, is not the truest patriot who will best serve his State and nation. And may I not say that the best, truest love of our country is one whose face brightens most as kind, true things are said of his own beloved State. If the State love of the South had been as wise as true, their patriotism would have been broader, and the fearful havoc of war might have been stayed.

Our home circles, then, if sweetest and truest, will cast about to brighten, refine and elevate all the neighboring homes. This will surely react and every home circle will sound a truer note of worth and virtue, because all the homes are in union. I suppose we must have different churches, just as we are told that divorce was suffered because of hardness of heart. But I have often thought wistfully of the good time when we should have only one church, for all would wish to be in one fold. How delightful when some one neighborhood club, literary and social, takes all into its fond embrace. Claremont has but one church. Claremont has a literary club and a horticultural club, both of which take in nearly all. All are welcome to each.

Michigan is forging ahead as few other sections in the country are. Even her people in the rural regions are acting together in a most wise and sensible way to secure the best things. Her hundreds of farmers' clubs, and other hundreds of granges, explain the rapid advance.

Southern California is holding up to the view of the world an example of successful co-operation among her fruit-men that must prove of immense value to us and to others, who surely will soon hasten to follow our example. Southern California has many successful, active clubs. These are mainly horticultural or pomological. A few are more in the trend of dairy interests. These clubs unite the people socially, make them pull as one in business affairs; tend to make the best work and methods of the community the common work and method; insure wise effort to direct and influence. These clubs are wonderful promoters of co-operation. Our Southern California Fruit Exchanges surely owe much of their phenomenal growth and success to the work of these clubs. They prepare the way.

In our "Farmers' Institutes" of Southern California we always aim to form a club, in case one is not already in existence, at each place, and we rarely fail to do so. These become social as well as economic functions, and their power for good in the community is tremendous. In some cases these monthly club meetings, which are usually held at the homes of the members, are held in the daytime, and the host furnishes a dinner for all. This, of course, involves some expense and much work, yet if there are 24 members or families in the club, this only comes once in two years, and when once over, two years of sumptuous monthly dinners are a certain expectancy. These frequent visitations keep the place fixed up, and are wonderful promoters of good fellowship in the community. In some cases they have served to advance the price of property, so valuable have been their work and influence. They have come to stay, and will hasten the glad time when farmers will no longer be handicapped by entire lack of organization, but will, through such organization, be as able to co-operate as are those of other crafts and business. These frequent and pleasant meetings insure a united and harmonious community, and will react to bring more of love and accord. I am sure, in every home.

There is just one impediment in the way of the success of these organizations, and this is the great bar to the best fruition in all enterprise and progress. This is selfishness. Our work pushes. Business seems imperative in her demands, and when club-day comes, we often forget, even though we may be on the program for the day, that our work is then at end for the club, and our business is to be there; and we stay at home. Very frequent mistakes of this kind will surely sap the interest in any club. Thus, for our own good, and for the good of our club and community, we must all pledge our full sympathy and support to the club.

These clubs have been so full of energy and so abundant in good fruits in Southern California, that they are becoming substantial factors in our rural life, and promise much for the future. Let it be a part of the good work of all our home circles, to help to inaugurate, sustain and make successful in all our communities, such clubs. They promise much for our homes, our neighborhoods, and for our country. Their promotion will be among the best part of our work and duty.

ADVERTISEMENT.

To Our Shippers :

We were obliged to notify you a few weeks ago that one Joseph M. McCaul had leased our old quarters at Nos. 120-122 West Broadway, New York City, and had there started up business under the name "HILDRETH, McCaul Co.," and had distributed a multitude of circulars so worded as to create the impression that his business was a successor to or a branch of the business of Hildreth & Segelken.

For the protection of our shippers and ourselves, we at once instructed our attorney to commence action to enjoin the said McCaul from using the name HILDRETH in any manner whatsoever in connection with his business. On the 10th day of July, 1901, Hon. David McAdam, Justice of the Supreme Court of the State of New York, after a full argument upon the merits, issued a peremptory injunction, of which the following is an extract :

"And it appearing that the plaintiffs have for a long time been and now are carrying on business under the style of 'Hildreth & Segelken,' and that the defendant has recently opened a business at 120-122 West Broadway, in the Borough of Manhattan, City of New York, and is carrying on the same under the style of 'Hildreth, McCaul Co.,' and that such act is in violation of the plaintiffs' rights, and that the commission or continuance thereof, during the pendency of this action will produce irreparable injury to the plaintiffs; it is

ORDERED that the defendant (Joseph M. McCaul) and each of his agents, servants and employees and all other persons acting under his authority and direction be, and he and they are hereby restrained and enjoined from showing, displaying or otherwise using during the pendency of this action in or upon any papers, devices, sign or signs, or otherwise, in the business conducted by the defendant at No. 120-122 West Broadway, in the Borough of Manhattan, City of New York, or elsewhere the name of "Hildreth" separately or conjunctively with any other name, designation or description."

Outside of our desire in our own interests to protect the name which we have built by years of satisfactory dealings with our customers, we hastened to procure this injunction as soon as possible, to prevent our shippers from being misled into sending their goods to one who would make an attempt to gain their trade by such a trick and device.

With thanks for the many expressions of good-will we have received from our shippers concerning this attempt to trade under our name, we are,

Sincerely yours,

HILDRETH & SEGELKEN,

265-267 Greenwich Street, NEW YORK, N. Y.

GENERAL ITEMS

Bee-Keeping in British Columbia.

It may interest some of the readers of the American Bee Journal to know I have initiated the successful keeping of bees in this section of the country. I know of no other bee-keeper in this whole district—certainly there are no bee-keepers nearer than 40 miles, that is, at Nelson, and I do not know of any there.

I was told that bees would not do here. A Mr. Powers brought some here a few years ago, and they could not find food, and he assured me I would fail. But I am a man "wonderfully wedded to my own opinions," and my present success is not going to make me have less faith in my own ideas.

I bought a colony of hybrid-Italians in Vancouver last spring, and they have given me three swarms, the first of which is doing remarkably well. They have two supers over a 10-frame Langstroth hive filled with honey already. That means between 60 and 70 pounds of honey for me, and it is 25 cents a section here. The original colony is not doing so well. They will not take to the supers, and appear lazy. Yesterday I tried to stir them to activity by taking a frame of honey from the brood-chamber and replacing it with an empty frame.

The other two colonies are doing pretty well, and have their winter supply, but nothing so far for me.

I think that when Mr. Powers first brought bees here there may have been no proper food for bees, but since then the town site has been cleared off, and the white clover is occupying the ground.

While writing this letter I have had a visitor from Nelson, who tells me he has been there,

To make cows pay, use Sharples from Separators, Book "Business Dairying" & Cat. 212 free. W. Chester, Pa.

QUEENS...

Long-Tongue
Golden 5-Banded...

Now is the time to requeen, when you can get the very best strain of untested queens for 50 cents each, or \$5.50 per dozen. Tested, 50 cents each, the rest of this season; breeders, \$2.25 each. I make a specialty of queen-rearing having had 35 years of practical experience with bees. I have over 400 fine Queens, and can fill orders on the same day I receive them. We have five mails a day.

This advertisement will not appear again. Remit by post-office money order.

OANIEL WURTH,

Coal Creek, Anderson Co., Tennessee.

[Mr. Wurth is perfectly reliable.—EDITOR.]

The Emerson Binder

This Emerson stiff-board Binder with cloth back for the American Bee Journal we mail for but 60 cents; or we will send it with the Bee Journal for one year—both for only \$1.40. It is a fine thing to preserve the copies of the Journal as fast as they are received. If you have this "Emerson" no further binding is necessary.

BEST Extracted Honey For Sale

ALL IN 60-POUND TIN CANS.

Alfalfa Honey

This is the famous White Extracted Honey gathered in the great Alfalfa regions of the Central West. It is a splendid honey, and nearly everybody who cares to eat honey at all can't get enough of the Alfalfa extracted.

Basswood Honey

This is the well-known light-colored honey gathered from the rich, nectar-laden basswood blossoms. It has a stronger flavor than Alfalfa, and is preferred by those who like a distinct flavor in their honey.

Prices of Alfalfa or Basswood Honey:

A sample of either, by mail, 10 cents, to pay for package and postage. By freight—two 60-pound cans of Alfalfa, 8 cents per pound; four or more cans, 7½ cents per pound. Basswood Honey, ½ cent more per pound than Alfalfa prices. Cash must accompany each order. You can order half of each kind of honey, if you so desire. The cans are boxed. This is all

ABSOLUTELY PURE HONEY

The finest of their kinds produced in this country.

Read Dr. Miller's Testimony on Alfalfa Honey:

I've just sampled the honey you sent, and it's prime. Thank you. I feel that I'm something of a heretic, to sell several thousand pounds of honey of my own production and then buy honey of you for my own use. But however loyal one ought to be to the honey of his own region, there's no denying the fact that for use in any kind of hot drink, where one prefers the more wholesome honey to sugar, the very excellent quality of alfalfa honey I have received from you is better suited than the honeys of more marked flavor, according to my taste.

McHenry Co., Ill.

C. C. MILLER.

Order the Above Honey and then Sell It.

We would suggest that those bee-keepers who did not produce enough honey for their home demand this year, just order some of the above, and sell it. And others, who want to earn some money, can get this honey and work up a demand for it almost anywhere.

GEORGE W. YORK & CO., 144 & 146 Erie St., Chicago, Ill.

Farm Wagon Economy.

The economy of this proposition is not all found in the very reasonable price of the wagon itself, but in the great amount of labor it will save, and its great durability. The Electric Wheel Co., who make this Electric Handy Wagon and the now famous Electric Wheels, have solved the problem of a successful and durable low-down wagon at a reasonable price.

ELECTRIC

This wagon is composed of the best material throughout—white hickory axles, steel wheels, steel bounds, etc. Guaranteed to carry 400 lbs. These Electric Steel Wheels are made to fit any wagon, and make practically a new wagon out of the old one. They can be had in any height desired and any width, and tire up to 8 inches. With an extra set of these wheels a farmer can interchange them with his regular wheels and have a high or low-down wagon at will.

Write for catalog of the full "Electric Line" to Electric Wheel Co., Box 10, Quincy, Ill.

and he is the only bee-keeper in that locality. He beats me, for he has had five swarms from one colony, making six in all, and they are doing well.

I have only to add that he and I are both beginners, and I value highly the hints I get from the American Bee Journal.

British Columbia, July 24. H. BEER.

The Honey Market in California.

The honey season is ended for this year in this locality. Our honey is in packages, and the most difficult problem for the bee-keeper is upon us—disposing of our honey at a price that will give us honest remuneration for the labor expended and capital invested.

I have heard some say the market is demoralized; I do not consider it so. A demoralized market is one where the product is thrown on the market and sold for what it will bring, and where there are more sellers than buyers. I am pleased to note that such is not the case in Southern California at present. There is very little honey moving, not because there are no buyers, but because the buyers are not offering what the producers think they are entitled to.

While there is no organization or general understanding amongst bee-keepers, yet there seems to be a general feeling that we ought to have, and will get, 5 cents a pound for this year's crop of extracted honey, and they are almost to a man living up to their feelings, and holding their honey; and I think if they hold on for 60 days longer they will realize their expectations.

Every little lot that is sold at the price the buyers are offering, the report of that sale is hawked all over the country, and made the most of to scare holders. J. W. GEORGE.
Riverside Co., Calif., Aug. 8.

An Experience and a Question.

I am not one of those lucky bee-keepers who get large yields of honey, yet I get fair yields. I keep a record of every colony, the date of swarming, etc. My hives are all numbered. If they have prolific queens it is so marked on the book, and those that are extra honey-gatherers are also marked. I started in the spring with nine colonies, and now I have 26, and have taken off 300 pounds of comb-honey. I will give the record of one colony, and then ask a question for Dr. Miller to answer:

May 20 I bought a colony of bees in a two-story hive for \$2.00. When I got them home I examined them, and found the upper story full of brood. June 19 they cast a swarm; it was very large, and when hived it filled a 10-frame hive apparently full. The hive of the old or parent colony is No. 21. The new swarm was hived in No. 15. In nine days after the first swarm No. 21 cast a second swarm, which was hived in No. 11. About five days after this, when I was absent from home, my son-in-law saw a swarm of bees in the air, but could not tell what hive they came out of. They clustered, and he hived them; it was a very small bunch. There was a space of about six inches between hive No. 15 and No. 11. A day or two after this little swarm was caught I saw bees going on the alighting-board from No. 11 to 15, and on looking into No. 11 I found some comb, but no bees. On the 13th—24 days after the

Langstroth on... The Honey-Bee

Revised by Dadant—1900 Edition.

This is one of the standard books on bee-culture, and ought to be in the library of every bee-keeper. It is bound substantially in cloth, and contains over 500 pages, being revised by those large, practical bee-keepers, so well-known to all the readers of the American Bee Journal—Chas. Dadant & Son. Each subject is clearly and thoroughly explained, so that by following the instructions of this book one cannot fail to be wonderfully helped on the way to success with bees.

The book we mail for \$1.25, or club it with the American Bee Journal for one year—both for \$1.75; or, we will mail it as a premium for sending us THREE NEW subscribers to the Bee Journal for one year, with \$3.00.

This is a splendid chance to get a grand bee-book for a very little money or work.

Please mention Bee Journal when writing

swarm was hived in No. 15—they cast a large swarm, and also had 28 sections nearly full, which they soon finished, and I took it off and gave them 28 empty sections, which they now have nearly filled. The old colony, after casting two swarms, filled the upper story with honey, and I extracted 35 pounds from them. I now have four colonies of bees and 64 pounds of honey, and more to take off, from my \$2.00. Now here is my question for Dr. Miller: If it takes 21 days from the laying of the egg to mature a bee, and a few days to make comb for a queen to lay in, how do you account for the large amount of bees in No. 15, so that they cast a large swarm in 25 days after being hived; also nearly filling 28 sections? And yet, after casting a swarm they continued to work in the boxes without any apparent loss of bees? The second swarm in No. 11 was almost as large as a prime swarm. Did a part of them swarm out, making the little swarm I have mentioned? If so, what became of the balance? Would they be received into No. 15?

S. B. SMITH.

Millelacs Co., Minn., Aug. 5.

An Amateur Transfer of Bees.

Having purchased a colony of bees in a box-hive the fall of 1898, and failing to secure any surplus in honey or swarms in 1899 and 1900, I decided to transfer this colony, win or lose. I read much on transferring, and sought to put in practice a part, at least.

About May 1 (apple blooming) I made preparations. A box eight inches deep and the same size as the bottom of the box-hive was made. An 8-frame dovetailed hive was gotten ready in this style: Four frames filled with comb were taken from four other hives (one from each hive), the outer frame being taken. No attention was given as to selection of frames. They contained in part some honey, empty cells, and perhaps eggs or

BARNES' FOOT POWER MACHINERY

Read what J. I. PARENT, of Charlton, N. Y., says: "We cut with one of your Combined Machines, last winter, 50 chaff hives with 7-in. cap, 100 honey racks, 500 brood-frames, 2,000 honey boxes, and a great deal of other work. This winter we have double the amount of bee-hives, etc., to make, and we expect to do it with this Saw. It will do all you say it will." Catalog and price-list free.

A Superior Red Clover Queen

(AN UNTESTED ITALIAN)

For sending us One New Subscriber and 25 cents (\$1.25 in all.)

We arranged with one of the oldest and best queen-breeders (having many years' experience) to rear queens for us this season. His bees average quite a good deal the longest tongues of any yet measured. The breeder he uses is direct from Italy, having imported her himself. Her worker-bees are large, somewhat leather-colored, very gentle, and scarcely requiring veil or smoke. They stored red clover honey last season.

All queens guaranteed to arrive in good condition, and all will be clipped, unless otherwise ordered.

We would like each of our present readers to have one or more of these fine Queens. Simply send us the name and address of a new subscriber for the American Bee Journal for one year, and 25 cents extra, and the Queen will be mailed to you. Our queen-rearers is now caught up with orders, and expects to be able to mail them hereafter within 48 hours after we receive the order. He is in another State, and we will send him the Queen orders as fast as we get them at this office. He is prepared to rear and mail a large number.

The cash prices of these Queens are \$1.00 each; 3 for \$2.70; or 6 for \$5.00.
Send all orders to

brood. These four frames were placed in the center of the new hive, and two frames with starters were placed on each side of this brood-nest. With a blanket, smoker, cold chisel, and hatchet, we went to destroy and to build.

The blanket was spread, and the old hive was placed on it, the new hive occupying about the same place as the old, while the old hive was placed about three feet and at right angles to the new hive. After smoke came the battle. I now turned the old hive bottom end up, and placed the box aforesaid on top, after removing the bottom-board. Then more smoke and hammering on the box to get the bees to move upward into it.

After ten minutes of such coaxing I lifted the box to see the catch. A surprise—about a good, big handful only. These were dumped out on a blanket in front of the new hive. Part started into the new hive while part went in the air. I sighed, and wondered how long it would take to get this colony moved into their new home—to be at this rate. I unlearned myself, as it were, and proceeded on my own "hook."

The old hive was returned bottom side down, less the bottom-board, and cold chisel, hatchet, and man soon removed two sides and laid bare the comb and bees. I cut out those old combs, rusty and crusty. The combs, when out, one by one, were given a jar at the front of the new hive, and clinging bees were soon off. The third comb removed had the queen—she went in like a lady.

When all combs were removed I found I had a plenty—I think enough to fill 20 Hoffman frames. It was old, perhaps containing comb that had been built 20 years, as the hive had been made of yellow poplar that now was

so weather beaten and checked as to be thrown in places.

While queen and workers were surveying the new quarters, I arranged a super with the fence separators, leaving out the sections. I now took up the comb pile and cut out all sealed worker-brood into strips of no particular length, but four inches wide, and put it in place of the sections. I put this in the brood-chamber, spread over the top a woolen blanket, put on the cover, and let them go at that. In a half hour from the time of beginning all was complete, and house-cleaning was in full progress.

The honey in the old comb was unfit for table use, so it was placed in three or four shallow pans about the yard, and the five colonies soon had the honey home. About two pounds of beeswax was rendered from all the combs after they were cleaned by the bees.

Twenty-one days later I examined the new home, and found most of the sealed brood hatched. I removed the old strips and put on a super filled with sections containing starters.

Now as to results: June 29 I took from this colony 24 full sections of well-capped white clover honey, and gave another super. July 15 I took this super with the same results as before, making in all 48 pounds for this colony, besides a full house below, and lots of bees.

Our honey season closes about the middle of July. We have had the best honey-year since 1898—an abundance of white clover till the drouth began. Our prime swarm, cast June 3, has done as much as this transferred colony. I feel that I have been successful in this transfer, and would like to know if such a way would always be successful, say in a poor honey-year.

T. F. WEAVER.

Fountain Co., Ind., Aug. 3.

A Pretty State of Things.

Mr. Editor will remember my new hive, that I was at so much pains to make. Twenty frames and painted a gentle clover green! Well, what do you think? About two weeks ago I gazed into its inwardness and beheld what could be not less than 50 pounds of luscious honey in those combs.

One afternoon, this week, I noticed that quite a lot of bees seemed aimlessly flying before the entrance, neither bringing in stores nor flying to the fields for supplies. I thought appearances strange, and forthwith inspected that colony again. I raised some of the most attractive frames, and, lo! they were remarkably light, just heavy enough to account for the wax they contained. I tried another with the same results. Now, why is this thusly? In handling all the frames I found but few with a little brood, and not three pounds of honey to that colony. Ha! ha! I have the secret. Robbers! But how can that occur with a pretty strong colony and a small—three-inch—opening to guard?

But presently I saw the cause of the whole trouble. I thought I had made the hive-cover perfectly tight, but the thing had warped, one corner failed to connect, leaving a space quite large enough to admit several bees at once, and then my conclusions were clear and rapid.

I transferred that colony into a 10-frame hive at once, before the little honey that was left could entirely disappear, closed up half the entrance, and saw to it that no more ex-

The Novelty Pocket-Knife.

Your Name and Address on one side—Three Bees on the other side.

[THIS CUT IS THE FULL SIZE OF THE KNIFE.]

Your Name on the Knife.—When ordering, be sure to say just what name and address you wish put on the Knife.

The Novelty Knife is indeed a novelty. The novelty lies in the handle. It is made beautifully of indestructible celluloid, which is as transparent as glass. Underneath the celluloid, on one side of the handle is placed the name and residence of the subscriber, and on the other side pictures of a Queen, Drone, and Worker, as shown here.

The Material entering into this celebrated knife is of the very best quality; the blades are hand-forged out of the very finest English razor-steel, and we warrant every blade. The bolsters are made of German silver, and will never rust or corrode. The rivets are hardened German silver wire; the linings are plate brass; the back springs of Sheffield spring-steel, and the finish of the handle as described above. It will last a lifetime, with proper usage.

Why Own the Novelty Knife? In case a good knife is lost, the chances are the owner will never recover it; but if the "Novelty" is lost, having name and address of owner, the finder will return it; otherwise to try to destroy the name and address, would destroy the knife. If traveling, and you meet with a serious accident, and are so fortunate as to have one of the "Novelties," your POCKET-KNIFE will serve as an identifier; and in case of death, your relatives will at once be notified of the accident.

How appropriate this knife is for a present! What more lasting memento could a mother give to a son, a wife to a husband, a sister to a brother, or a lady to a gentleman, the knife having the name of the recipient on one side?

The accompanying cut gives a faint idea, but cannot fully convey an exact representation of this beautiful knife, as the "Novelty" must be seen to be appreciated.

How to Get this Valuable Knife.—We send it postpaid for \$1.25, or give it as a Premium to the one sending us THREE NEW SUBSCRIBERS to the Bee Journal (with \$2.00). We will club the Novelty Knife and the Bee Journal for one year, both for \$1.90.

HONEY AND BEESWAX

MARKET QUOTATIONS.

CHICAGO, Aug. 22.—White comb brings 15c per pound for the choice grades, with other lines not grading No. 1 selling at 13 1/4 to 14c; light amber, 12 1/2 to 13c; dark, 10 1/2 to 11c. Extracted, fair demand at 50¢ per gallon; white, and 52¢ to 54¢ for amber; dark grades, 5c. Beeswax steady at 30c for choice yellow. R. A. BURNETT & CO.

CINCINNATI, Aug. 10.—The honey market is rather dull on account of the warm weather. Extracted sells only to manufacturers from 50¢ to 60¢; better grades alfalfa water-white from 66¢ to 70¢; white clover from 66¢ to 68¢. Fancy white comb honey sells from 13 1/4 to 15¢. C. H. W. WEBER.

BOSTON, Aug. 19.—Our market today is about 10 1/2 to 17c for fancy; A No. 1, 15 1/4 to 16c; No. 1, 14 1/2 to 15c. Extracted, full supply, light demand.

Several lots of new Vermont honey in cartons have thus far been received, meeting a ready sale at 17c, although of course in a small way. The trade generally seems disposed to hold off, looking for larger receipts and lower prices. This is somewhat due, of course, to the fact that the demand is still light owing to the warm weather. Cooler weather will make a better demand and naturally make a better feeling.

ALBANY, N. Y., Aug. 20.—We quote: Fancy white comb, 16 to 17c; No. 1, 15 1/4 to 16c; No. 2, 13 1/4 to 14c; mixed, 12 1/2 to 13c. Extracted, light, 7 to 8c; mixed, 6 1/2 to 7c. H. R. WRIGHT.

OMAHA, Aug. 8.—New comb honey is arriving by express in small quantities from Iowa and Colorado, and selling at \$3.50 per case in a retail way. California extracted honey is being offered carlots at 4 1/4 to 4 1/2 c per pound, f.o.b. California shipping points, but we have not heard of any sales having been made thus far. The production of extracted honey seems to be quite large this year in Colorado, Utah and California. PEYCKE BROS.

NEW YORK, Aug. 7.—There is some demand for new crops of comb honey, and receipts are quite numerous for this time of the year. They have been principally from the South, but we are now beginning to receive shipments from New York State and nearby. We quote: Fancy white, 15c; No. 1 white, 13 1/4 to 14c; amber, 11 1/2 to 12c. No new buckwheat is on the market as yet, and we do not expect any before next month.

Extracted is decidedly dull. Plenty of offerings, with only a limited demand, and quotations are rather nominal. We are selling at from 5 1/4 to 5 1/2 c, according to quality, and Southern in barrels at from 5 1/4 to 5 1/2 c per gallon. Beeswax dull and declining; for the present we quote 27 1/2 to 28c. HILDRETH & SROGELKEN.

DES MOINES, Aug. 7.—There is very little doing here in new crop of honey. Some small lots of near-by produced comb honey are on the market and selling in a retail way at \$3.50 to \$3.75 per case. We do not look for much trade in this line before Sept. 1. Our market does not consume a great deal of extracted honey. PEYCKE BROS. & CHANEY.

DETROIT, Aug. 12.—Fancy white comb honey, 14 1/2 to 15c; No. 1, 13 1/4 to 14c; no dark to quote. Extracted, white, 6 1/2 to 7c. Beeswax, 25 to 26c. M. H. HUNT & SON.

BUFFALO, Aug. 10.—Quite a good demand for fancy honey, 10 1/2 to 11c, and lower grades, 12 1/4 to 13c; old grades, 14 to 15c. The market for extracted honey is quiet. Advise moderate shipments only of new as yet. BATTERSON & CO.

SAN FRANCISCO, Aug. 14.—White comb, 11 1/2 to 12c; amber, 8 1/2 to 9c; dark, 6 1/2 to 7c. Extracted, white, 5 1/4 to 5 1/2 c; light amber, 4 1/4 to 4 1/2 c; amber, 4 1/4 to 4 1/2 c. Beeswax, 2 1/2 to 2 3/4 c.

Market continues quiet, with apiarists, as a rule, unwilling to unload at prices generally regarded by wholesale operators. Quotations represent as nearly as possible the values ruling at this date for round lots, although few sales could not be probably be effected at full figures, while, on the other hand, higher prices than quoted are being realized in the filling of some small orders.

KANSAS CITY, Aug. 6.—Some very fine Missouri honey is now on the market, selling at 10 1/2 to 11c for fancy. The market for extracted honey in carlots for first half of August, shipping at 10c per pound for No. 1, and 9 1/4 to 9 1/2 c for No. 2, f.o.b. shipping-point. The market for extracted honey is as yet rather unsettled, asking prices ranging from 4 1/4 to 4 1/2 c, f.o.b. shipping-point. Buyers, however, seem to be in no hurry to make contracts. PEYCKE BROS.

We have a Large Stock on hand and can ship promptly.

—THE—

Bee-Keeper's Guide

Or, Manual of the Apiary.

—BY—

PROF. A. J. COOK.

460 Pages—16th (1899) Edition—18th Thousand—\$1.25 postpaid.

A description of the book here is quite unnecessary—it is simply the most complete scientific and practical bee-book published to-day. Fully illustrated, and all written in the most fascinating style. The author is also too well-known to the whole bee world to require any introduction. No bee-keeper is fully equipped, or his library complete, without THE BEE-KEEPER'S GUIDE.

This 16th and latest edition of Prof. Cook's magnificent book of 460 pages, in neat and substantial cloth binding, we propose to GIVE AWAY to our present subscribers, for the work of getting NEW subscribers for the American Bee Journal.

Given for TWO New Subscribers.

The following offer is made to PRESENT subscribers only, and no premium is also given to the two NEW subscribers—simply the Bee Journal for one year:

Send us two NEW SUBSCRIBERS to the Bee Journal (with \$2.00), and we will mail you a copy of Prof. Cook's book FREE as a premium. Prof. Cook's book alone sent for \$1.25, or we club it with the Bee Journal for a year—both for only \$1.75. But surely anybody can get only TWO NEW SUBSCRIBERS to the Bee Journal for a year, and thus get the book as a premium. Let every body try for it. Will YOU have one?

GEORGE W. YORK & CO.,

144 & 146 Erie Street,

CHICAGO, ILL.

24th Year Dadant's Foundation. 24th Year

We guarantee satisfaction. **

What more can anybody do? BEAUTY, PURITY, FIRMNESS, No SAGGING, No LOSS, PATENT WEED-PROCESS SHEETING.

Why does it sell so well? **

Because it has always given better satisfaction than any other. Because in 23 years there have not been any complaints, but thousands of compliments.

Send name for our Catalog, Samples of Foundation and Veil Material. We sell the best Veils, cotton or silk.

BEE-KEEPERS' SUPPLIES OF ALL KINDS.

Very fine pure-bred BARRED PLYMOUTH ROCK Chickens and Eggs for sale at very low prices.

Langstroth on the Honey-Bee—Revised,

The classic in Bee-Culture—Price, \$1.25, by mail.

Beeswax wanted at all times.

ANOTHER ENDORSEMENT

—FOR—

Root's Red Clover Queens

ALEXANDRIA, IND., Aug. 1, 1901.

THE A. I. ROOT CO., Medina, Ohio.

Dear Friends:—The tested clover queen came in good condition and has filled seven frames with brood two weeks from the day she arrived, which is better than the combined efforts of three "yellow" queens purchased two years ago. I believe she is going to be the counterpart of the queen purchased of you in 1896, in which case money could not buy her.

Yours Fraternally,

EVAN E. EDWARDS.

PRICES OF RED CLOVER QUEENS:

Gleanings in Bee-Culture one year and Untested Queen	\$2.00
" " " " Tested Queen	4.00
" " " " Select Tested Queen	6.00

If you want something good you can not do better than to order one of these queens. All orders are filled promptly. No extra postage on these to foreign countries.

☞ If more convenient, Dues may be sent to the office of the American Bee Journal, when they will be forwarded to Mr. Secor, who will mail individual receipts.

A Celluloid Queen-Button is a very pretty thing for a bee-keeper or honey-seller to wear on his coat-lapel. It often serves to introduce the subject of honey, and frequently leads to a sale.

NOTE.—One reader writes: "I have every reason to believe that it would be a very good idea for every bee-keeper to wear one (of the buttons) as it will cause people to ask questions about the busy bee, and many a conversation thus started would wind up with the sale of more or less honey; at any rate it would give the bee-keeper a superior opportunity to enlighten many a person in regard to honey and bees."

The picture shown herewith is a reproduction of a motto queen-button that we are furnishing to bee-keepers. It has a pin on the underside to fasten it.

Price, by mail, 6 cents; two for 10 cents; or 6 for 25 cents. Send all orders to the office of the American Bee Journal.

A Superior Red Clover Queen

(AN UNTESTED ITALIAN)

For sending us One New Subscriber and 25 cents (\$1.25 in all.)

We arranged with one of the oldest and best queen-breeders (having many years' experience) to rear queens for us this season. His bees average quite a good deal the longest tongues of any yet measured. The Breeder he uses is direct from Italy, having imported her himself. Her worker-bees are large, somewhat leather-colored, very gentle, and scarcely requiring veil or smoke. They stored red clover honey last season.

All queens guaranteed to arrive in good condition, and all will be clipped, unless otherwise ordered.

We would like each of our present readers to have one or more of these fine Queens. Simply send us the name and address of a new subscriber for the American Bee Journal for one year, and 25 cents extra, and the Queen will be mailed to you. Our queen-rearers is now caught up with orders, and expects to be able to mail them hereafter within 48 hours after we receive the order. He is in another State, and we will send him the Queen orders as fast as we get them at this office. He is prepared to rear and mail a large number.

The cash prices of these Queens are \$1.00 each; 3 for \$2.70; or 6 for \$5.00.

Send all orders to

GEORGE W. YORK & CO.,
144 & 146 Erie Street, CHICAGO, ILL.

25 cents Cash paid for Beeswax.

This is a good time to send in your Beeswax. We are paying 25 cents a pound—CASH—for best yellow.

low, upon its receipt, or 27 cents in trade. Impure wax not taken at any price.

Address as follows, very plainly,

GEORGE W. YORK & CO., 144 & 146 Erie St., Chicago, Ill.

The Novelty Pocket-Knife.

Your Name and Address on one side—Three Bees on the other side.

[THIS CUT IS THE FULL SIZE OF THE KNIFE.]

Your Name on the Knife.—When ordering, be sure to say just what name and address you wish put on the Knife.

The Novelty Knife is indeed a novelty. The novelty lies in the handle. It is made beautifully of indestructible celluloid, which is as transparent as glass. Underneath the celluloid, on one side of the handle is placed the name and residence of the subscriber, and on the other side pictures of a Queen, Drone, and Worker, as shown here.

The Material entering into this celebrated knife is of the very best quality; the blades are hand-forged out of the very finest English razor-steel, and we warrant every blade. The bolsters are made of German silver, and will never rust or corrode. The rivets are hardened German silver wire; the linings are plate brass; the back springs of Sheffield spring-steel, and the finish of the handle as described above. It will last a last-time, with proper usage.

Why Own the Novelty Knife? In case a good knife is lost, the chances are the owner will never recover it; but if the "Novelty" is lost, having name and address of owner, the finder will return it; otherwise try to destroy the name and address, would destroy the knife. If traveling, and you meet with a serious accident, and are so fortunate as to have one of the "Novelties," your Pocket Knife will serve as an identifier; and in case of death, your relatives will at once be notified of the accident.

How appropriate this knife is for a present! What more lasting memento could a mother give to a son, a wife to a husband, a sister to a brother, or a lady to a gentleman, the knife having the name of the recipient on one side?

The accompanying cut gives a faint idea, but cannot fully convey an exact representation of this beautiful knife, as the "Novelty" must be seen to be appreciated.

How to Get This Valuable Knife.—We send it postpaid for \$1.25, or give it as a Premium to the one sending us THREE NEW SUBSCRIBERS to the Bee Journal (with \$3.00). We will club the Novelty Knife and the Bee Journal for one year, both for \$1.00.

GEORGE W. YORK & CO.

St., Chicago, Ill.

☞ Please allow about two weeks for your knife order to be filled.

ESTABLISHED IN 1861 AMERICAN THE OLDEST BEE-PAPER IN AMERICA BEE JOURNAL

41st YEAR.

CHICAGO, ILL., SEPTEMBER 12, 1901.

No. 37.

* Editorial. *

Glucose Not a Wholesome Sweet.—Dr. J. H. Kellogg, of the Good Health Publishing Company, and widely known as an authority on health foods, answers the question, "Is glucose a wholesome sweet?" in this way:

No. The glucose of commerce is manufactured from corn and other starchy substances by boiling them with sulphuric acid. This form of sugar is quite unlike the sugar formed by the digestive processes. There is no doubt that the large use of glucose, or grape-sugar, in the form of candy, syrups, adulterated honey, and various other meretricious products which have been put upon the market, is responsible for a large number of cases of diabetes—a disease which is rapidly increasing.

We are often asked concerning the advisability of feeding glucose to bees for winter stores, or to keep them going during a drouth. Our answer is, invariably, Don't. A certain bee-keeper who numbers his colonies by the hundreds, experimented in this matter last fall, by trying to feed something like a ton of glucose to his bees. He won't do so any more. We have been trying to get him to write out the results of the experiment for publication, but so far have failed to get him at it. We imagine that he is trying to forget his mistake as soon as possible.

In our opinion, bee-keepers can't get and stay away too far from the whole glucose business.

Big Money in Bees.—In the American Bee-Keeper, F. G. Herman does his full share toward inducing a venture into bee-keeping. He began with one colony and now has 60. He says:

It has been my experience, and that of bee-keepers generally, that there are fewer risks and larger profits in comparison to the amount of capital invested in bee-keeping than in any other business. Of course, emergencies do arise, but if they are met by ordinary foresight and common-sense, they are not likely to result disastrously.

Now, that's encouraging. One prefers a safe business, even if the profits are less; and there are fewer risks in bee-keeping "than in any other business." But it is cheering to know that in bee-keeping we are not confined to small profits, for there are larger profits upon the capital invested "than in any other business." If J. Pierpont Morgan had only had the foresight to invest his money in bees, he might to-day have been a rich man!

Without any desire whatever to harbor any doubts as to bee-keeping being the business

of fewest risks and largest profits, one still has a secret longing for definite figures. There is comfort in looking them over and making estimates for the future. Fortunately Mr. Herman has given us just what we want. He says:

It is a conservative estimate of the bee-keepers generally, however, that each colony should bring in at least five dollars a year, and as each colony also throws off a swarm annually, it is easy to see how a little capital invested in bees will grow and multiply, besides yielding a very fair percent of profit.

Let us figure upon this basis, and see what Mr. Herman's income should be five years from now. As the number of colonies doubles each year, his present 60 colonies will in five years increase to 1920, and as each of these should bring in at least five dollars a year, his income will be \$9,600, and in 10 years from now it will be \$307,200. Note that this is not the wild vision of a dreamer, but the estimate of bee-keepers generally. Note, too, that it is a conservative estimate. Each colony should bring at least five dollars. That's in the poorest years. There are good years when the income is ten, twenty, fifty times as much as in one of the poorest years. Let us continue to be conservative, and say the income will be only ten times as much. That will make the income in ten years from now a round three millions, with \$72,000 left for loose change.

The only wonder is, that with all this there is such careful concealment of the names of all the millionaire bee-keepers.

Wild Statements About Bees are often made in the general press, and sometimes are copied unchanged in bee-journals. The following paragraph occurs in the Pacific Bee Journal:

It is interesting to note in a northern California paper mention is made of a fruit-grower heading with a six-horse team a billion or more bees "to fertilize them in his orchards to aid in fertilizing the pear-blossoms."

If each colony contains 50,000 bees, a billion of bees would make 20,000 colonies! Estimating the weight of each colony at 50 pounds, the whole weight would be 500 tons. Unless the six-horse team would make more than one trip a day, it would take the biggest part of the year to do the hauling.

Extracting-Supers.—"Loyalstone," of whom the Australian Bee-Keepers' Review says he is a practical apiarist, all of whose writings are well worth reading, differs in some of his views from many if not most of the bee-keepers on this side the globe. He advises against the use of shallow frames in

extracting-supers, saying, "Full-depth frames pay best, as they hold more honey and require less handling." He also objects to barring the queen out of extracting-supers, because if the queen is allowed full range the bees will work better and not be so likely to swarm.

The editor of the same journal doubts very much that it requires less brains to work for extracted than for comb honey.

Hive-Covers.—A good cover is a very important part of a hive. At the present time the most popular cover is probably the plain board cover. Editor Hutchinson thinks there is nothing better for the North, and finds it hard to believe it is not the best everywhere. To this the editor of the Rocky Mountain Bee Journal replies:

Editor Hutchinson says in the July Review, that for hive-covers, "in the northern part of the United States, there is nothing better than a plain board of white pine, thoroughly cleated and painted; and it is hard to believe that such a cover is not the best cover in any climate." That sort of a cover may be all right in the rain-belt, but if Mr. H. will come out here we will show him hundreds of such covers so full of checks that they afford little more protection than a sieve. We have experimented quite largely with covers for this climate, and have concluded that a plain, flat cover made of rough boards and covered with "Napoleon Red Rope Rowing," is about as good as can be devised. This fabric, when painted white, is a very poor conductor of heat, and if a new coat of paint is added every spring, will remain water-proof indefinitely. Another merit it possesses is cheapness, costing only about 3½ cents per 10-frame cover.

However well satisfied Editor Hutchinson may be with the plain board cover, it is not alone in the trying climate of Colorado that murmurs are beginning to arise against it. The plain board cover has its advantages. It is not expensive. No quilts or sheets are needed with it, and it is light to handle. When new, it makes a close fit, leaving nothing to be desired. But it will not always stay new. With time it will curl up at the edges, allowing cracks large enough for cold to enter, and sometimes large enough for robbers to enter. Still worse, it will twist so that it will not lie flat. Making the cover of several pieces (although it takes it out of the list of plain covers), and beveling the edges, will help against the warping that makes the edges curl up, but it will not prevent twisting.

The bee-keeper who has thrown aside his bungling telescoping cover with its quilt is greatly pleased with the simpler plain cover, but he can not resist a yearning for the greater warmth of the discarded cover in cool weather, and when the sections melt down in his supers because the hot sun shines upon the plain board covers, he remembers that he

never had any trouble of that kind in the olden time.

Some have expressed a desire, for, or have already used, a cover approaching the plain board cover in lightness and convenience without its objections. It is a cover made of two surfaces with an air-space between. An upper surface of $\frac{3}{4}$ inch stuff with the grain running lengthwise, and a lower surface of the same stuff with the grain running crosswise, have between them an air-space made by strips of $\frac{3}{4}$ inch stuff between the margins. In other words, a shallow box closed top and bottom, the inside of the box being $\frac{3}{4}$ inch deep. Of course it must be covered by tin or some cheaper material. The grain of the two surfaces running in opposite directions makes all warping and twisting impossible. The dead-air space is a good non-conductor, making the cover warm in cool or cold weather, and cool in hot weather. Such a cover may possibly be the coming cover to be what Editor Hutchinson believes the plain cover already is, "the best cover in any climate."

Deep-Tubed Honey-Plants.—Until lately it is probable that most bee-keepers—probably nearly all—have thought of red clover as the only honey-plant with tubes too deep for the reach of ordinary bee-tongues. Red clover is far from being the only one. Editor Root says this in gleanings in Bee-Culture:

In addition to the great honey-plants, red clover, buffalo clover and horsemint, of Texas, that have long corolla-tubes, I can now add to the list the mountain sages of California, especially the white sage. This last has quite deep corolla-tubes; and I was told, while on the coast, that unless these corolla-tubes are very full the bees do not get much honey from this source. This is exactly the case with red clover. So it appears that long-tongued bees, if good in the North, will be in great demand all through the South, throughout Central and Southern California, as well as throughout all those States that grow red clover; and I have been surprised to find so much of it in the West. It appears, then, that $\frac{7}{8}$ long-tongued bees are an advantage in the case of all the other honey-plants I have named.

Weekly Budget.

MR. CHARLES CLARKE is a bee-keeper. He is a bee-keeper of not many years' experience, but he is a good bee-keeper. He knows how to produce honey. He knows how to handle foul brood, too.

We made our second visit to Mr. Clarke's apiary Thursday afternoon, Aug. 22. He lives about 12 miles south of Chicago, in a splendid sweet clover district. He began last spring with about 20 colonies, has increased to nearly 60 colonies, besides taking off something like 1000 pounds of as fine comb honey as we ever saw, and will likely have 1000 pounds more.

Mr. Clarke had just completed a new honey-house, in which he had the honey all tiered up on shelves made of planks on edge and 2x2 inch stuff on top of them. It was a splendid arrangement for the very best curing possible before being put into cases for market.

Everything was in as neat condition as possible. The apiary is at the rear of the dwelling house, in a veritable flower-garden, except that around the hives there was not a flower, weed, or blade of grass. All was clear, and each hive easy of access.

Mrs. York accompanied us on this little trip. We spent a very pleasant time with Mr. Clarke and his parents, with whom he lives. They are about 70 years of age. Mr. Chas. Clarke is the only "child" at home. Of course he is quite an old "child" himself. He has never taken unto himself that which would make him to be the "lesser half." We suppose his good mother could hardly spare him, as he is as handy about the house as most daughters would be.

Mr. John W. Clarke, his father, has a justice court in that part of the city where he lives. He has been "handing out" justice for nearly 30 years, and we believe, has never had one of his decisions reversed. When he "decided" to "allow" "Charles" to go into the bee-business, it was a wise piece of "justice," as has been clearly proven by the good crops of honey the bees have gathered for him.

MORE ON THE FIRST 1000.—Still they come. We mean members of the National Bee-Keepers' Association. During the past week we have received the following names with \$1.00 each:

H. K. BEECHAM.	A. L. JENKS.
RICHARD CHINN.	W. A. FRANK.
JOS. BEAUDRY.	O. P. HENDRIX.
WM. A. TAYLOR.	F. Z. DEXTER.

DR. C. C. MILLER, of McHenry Co., Ill., wrote us Aug. 27, as follows:

"After the terrible drouth, which nearly or quite stopped the rearing of brood in July, it seems a great blessing to have a steady and fairly good fall flow which will leave the colonies with plenty of young bees for winter. I have also taken advantage of it to make some new colonies."

MR. C. H. LAKE, residing near Baltimore, Md., wrote us Aug. 27:

"Bees did poorly here this season, except in one instance. Honey-dew has ruined my crop of honey for three seasons past."

MR. GEO. A. OHMERT AND APIARY, of Dubuque Co., Iowa, are shown in our front-page illustration this week. When sending the photograph, Mr. Ohmert enclosed the following:

FRIEND YORK:—I started in the spring of 1900 with 18 fairly strong colonies, and in very few ones. They built up through April and May to be quite strong; then white clover came, which was very abundant, and the bees began to swarm. There would be from three to five swarms out at the same time, and mixed together. We would have a great time dividing them, but we finally got them settled down to work.

We harvested about 900 pounds of white clover honey. The basswood flow lasted only about four days, and then our great drouth was on, and the honey-flow stopped.

We had 450 well-filled sections, leaving all the partly filled ones on, and the most of it was carried down during the drouth.

We have now 45 strong colonies, with plenty of honey, providing we get any kind of a fall flow, which I think we will, as the drouth was broken to-day (July 28) with a very heavy rain.

I was expecting to go to Buffalo this fall at the bees' expense, but we lost our raspberries

and blackberries, so the bee honey-money will have to go towards making up that loss.

I send a picture of a part of our apiary. We could not get it all in. The little boy up towards the house is my main assistant. Mrs. Ohmert is sitting on a chair under a tree. Our youngest is standing by me. We have one more little girl in the picture, and the rest are neighbors' children.

In front you will see my home-made extractor. It works all right, and is away ahead of the small extractors I have seen around here. The cost, outside of the work, was \$3.25. I can extract partly filled sections very rapidly.

GEO. A. OHMERT.

MR. F. DANZENBAKER wrote us Aug. 29, that the severe illness of his wife makes it impossible for him to attend the Buffalo convention. We trust she may soon recover. It will doubtless be quite a trial to Mr. D. to be deprived of being at the convention, for he enjoys such gatherings.

MR. THOS. DOUGHERTY, of Bureau Co., Ill., called at our office last week. He has been keeping bees, off and on, for 40 years. He now has 25 colonies, and reports a good season. Mr. D. says he can get one or two cents per pound more for honey in the tall 4x5 sections than for honey in the square sections, in his local market.

HON. EUGENE SEOR is on the program of the 21st annual session of the Farmers' National Congress, to be held at Sioux Falls, S. Dak., Oct. 1 to 10, 1901. His subject is: "Some Problems Confronting the American Farmer." Surely, he has an extensive text, and one that permits of considerable latitude in its discussion.

THE APIARY OF LOUIS C. KOEHLER (see page 585) is situated in Manitowoc Co., Wis., and contains 185 colonies of bees, all in 10-frame Langstroth hives, except a few which he uses for experimental purposes. This apiary was started 20 years ago with five colonies of bees, and it has proved to be a success, although there have been set-backs and poor seasons. His father calls it the "big circus," and their farm he calls the "side-show."

The apiary is run entirely for extracted honey, which is all disposed of in the home market, being sold direct to the consumer. The white clover and the basswood honey are sold at 10 cents per pound, and the goldenrod at 9 cents. In the neighboring cities he has disposed of about three-fourths of a pound per capita on an average; he thinks this a pretty high average, and would like to hear of any one who has done any better.

Mr. Koehler has a honey-house 16x28 feet floor-space, and 12 feet high. The lower floor is divided into two rooms; one is the extracting-room, 16x16 feet, and the other is the honey storage-room, 12x16 feet. The second floor is used as a store-room for empty boxes, frames, etc., and as a paint-shop. He uses extractors of his father's own invention.

MR. F. WILCOX, of Juneau Co., Wis., dropped in to see us, Sept. 2, when on his way East to attend the Buffalo convention, and visit that part of the country. He reports the fall honey crop a failure in his region, but the yield from clover was good, especially alsike clover. There being several days of cool weather just at basswood bloom, the yield from that source was not very good.

Transferring Worker-Comb for Drone-Comb.

BY C. P. DADANT.

IN reply to a question on this subject, I would say that it is indispensable for the novice to learn how to transfer combs properly, for many reasons. First, he may have bees in old boxes, swarms hived in haste, in any kind of a receptacle—a dry goods box, a cracker box, a keg, or perhaps even a hollow tree, though the latter are getting scarce when compared to 35 years ago.

Then, there is the exchanging of drone-comb for worker-comb, as mentioned in the query. It is also sometimes necessary to straighten combs, or even to take them out entirely, if not built true in the center of the frames; for a movable-frame hive deserves its name *only* when each comb hangs true on a separate frame. Before the invention of comb foundation, it was much more difficult to secure straight combs, and apiarists had recourse to all sorts of devices to compel the bees to follow the straight line. These devices were more or less successful, and for that reason the handling of the frames in the management of the apiary was more difficult than today.

It must be borne in mind that drone-comb may be removed with the best results when the combs are dry, and so the time for this work is early in the spring or during a dearth of honey.

When examining the frames, set aside all that have more drone-comb than worker-comb, and cut out every-

FASTENING TRANSFERRED WORKER-COMB.

thing. This will give you a number of pieces of good worker-comb to use. The frames that have been thus emptied can be supplied with either a strip or a full sheet of foundation, and placed in a hive in which a swarm is to be hived.

It does not matter how small a piece of worker-comb you may have, do not destroy it, unless it is absolutely too old and dirty or crooked. Small pieces may be used as well as large ones. I remember that my father, when I was yet a boy, used to transfer into our hives the combs of small boxes in which we had received imported queens from Italy. At that time the exporters put up the queens for shipment in small boxes with two frames of comb, each comb about $3\frac{1}{2}$ inches. My father would make a very decent frame of comb with some 16 of those pieces arranged symmetrically in the frame, four in the length and four in the height of the frame. With a little labor from the bees, we had a very good comb with no drone-cells, except an occasional one at the seams, and it is certain that those combs could still be found in our hives, showing plainly the suture or seam made by the bees. I

may say that at one time we imported as many as 300 queens annually from Italy.

To hold the combs in place, we use a light wire, say No. 16, of about the height of the frame, and with both ends bent at right angles, so the wire may be driven into the wood at the top and bottom. It is well to punch a small hole previously, with an awl, for it helps in driving the wire into the wood. A number of these are put on one side of the frame, and the frame is laid on the table with the wires on the underside, then the piece of comb is fitted, and more wires nailed on top of it.

To fit a piece of worker-comb into a gap from which a drone-comb had been removed, lay your spare piece of worker-comb on the table, then put the frame down upon it with the empty space over the comb, you can thus mark the exact size and shape of the piece to be cut. This is marked with a sharp knife. If the cut is made exact and the combs are rather old, the fit will be so good that no support will be needed, and the bees will have them fastened together before there is any danger of the patch coming to pieces. In putting in small pieces shorter wires may be used. (See engraving).

There is no need of leaving the wires on after the combs have been repaired by the bees. If you leave them, it will spoil a row of cells all the way up and down along each wire. Usually a week is amply sufficient to have the combs patched and in good order, unless the colony is weak and there is no flow of honey.

If transferring is to be tried during a honey-flow, it is necessary to extract the honey out of the combs first. Under no circumstances would a good apiarist transfer combs during a hot spell of weather, especially if there was much honey, unless the combs to be handled were old and tough.

Never destroy good worker-combs, unless they are so exceedingly dirty that it is evident that the queen would not, or could not, lay eggs in them. That is usually the case with the lower edge of the combs of a very old hive. But if the combs are clean, age makes no difference; we have combs over 40 years old that I would not exchange for the same area of foundation.

Some writers will tell you that bees can build combs so fast, and so cheaply, that a swarm hived on empty frames will succeed about as well as one hived on combs already built; but you must class them with the farmers who tell you that land without manure can be kept as productive as land that is well manured. Such talk makes a diversion, it causes discussions, and breaks the monotony by causing the heads to warm up; but in the long run, all the fine-spun theories give way to plain facts.

Hancock Co., Ill.

Hiving Two Swarms in One Hive.

BY C. DAVENPORT.

LAST year I wrote an article for the American Bee Journal, in which I stated the fact, and endeavored to explain why a good deal more surplus white honey could be obtained here if two swarms were hived together in one hive than could be if each were given a separate hive. In commenting on this in his inimitable way, Mr. Hasty compared it to Hamlet with Hamlet left out; and from what he further said I infer that he has had, or thinks there would be, trouble on account of the queens being balled. But in the hundreds of natural swarms I have hived in this way I do not remember a single instance where any trouble of this kind occurred, and no precaution whatever was ever taken to prevent it; that is, when both swarms issued at or about the same time. It would be of interest to me, if Mr. Hasty would say whether he ever had any trouble of this kind, or only thought there might be.

Of course, with artificial swarms, or when two natural swarms that issue on different days are hived in one hive, precautions have to be taken to prevent the bees from fighting, but this is not done with any special regard to prevent the queens being balled.

What leads me to say more on this subject is that soon after what I wrote last year was published, a friend of mine, who keeps bees in a small way, came to my place and wanted to know much more in regard to the matter than I had explained, and was much pleased to find out that natural swarms that issued a few days apart could be put together so they would work as well as they would when they both swarmed the same day; when this occurred he had no trouble in getting both swarms to work peacefully together in one hive, in which case he knew from his own

experience that nearly as much again white honey could be secured than if the forces were divided up.

It is a simple and easy matter to unite successfully swarms that come out within three or four days of each other. All that is necessary is to have the swarm that issues last in a separate hive, and leave it in this till evening, then carry it to the hive that contains the swarm which it is desired to unite it with. The bees of this swarm, that issued first, are now smoked enough so they will thoroughly fill themselves with honey; or the plan will work if there is no honey in the hive for them to fill up on, if they are smoked enough to take the fight all out of them.

They are now all shaken in any way most handy, down on the ground in front of their hive. Then the bees of the last swarm are dumped on top of them and all allowed to crawl into the hive together. The whole operation need not take over five minutes, and has always been a success with me. The bees of the last swarm need no smoke if they are united the same day they swarm, but the plan will also work just as well as if the second swarm is left until the second or third day; but in this case the bees of both swarms would need to be well smoked, and, of course, the hive that contained one swarm would, the first day, have to be set close beside the other, or the bees from the swarm moved would return to the location or place where their hive was first set, if there is a laying queen with each swarm, and as I have no particular preference as to which survives, no attention is paid to them. Of course, one is always killed, and this is almost invariably done the first night. Whether this murder is committed by the bees, or settled by royalty itself, I am not able to say, but my opinion is that the bees are not guilty, for I have often noticed these queens that would be found dead in front of the hives the next morning, and their wings and the hair or fuzz on their bodies was not gnawed or marred up, which, so far as I have observed, is usually the case when a queen is balled and worried to death by the bees. However this may be, I never knew one queen to fail to survive, though when one swarm has a virgin queen it is usually the virgin that survives and she may be lost on her wedding-trip. Such cases have occurred with me, but of late I always have a laying queen with these double swarms, for it may be a number of days before a virgin queen gets to laying, when all goes well, and a swarm with a laying queen does much better section work than one with a virgin, and a very few days in a good flow may mean a great deal with these allied forces.

But I would advise all who try this plan of having two swarms in one hive, not to have a laying queen only, but also to have her wings clipped, or else use an entrance-guard until fully satisfied that they have settled down to work and intend to stay; for these big double swarms are more liable to desert than a single swarm is. I lost an immense one last year; there were nearly three full swarms in it. Of course it was carelessness, and might have been prevented.

The having of two swarms together is very profitable with me. Others may not meet with the same success; we can not all obtain the same results with the same plan. For instance, in the American Bee Journal for May 24, 1900, is an extract from the Canadian Bee Journal in which Mr. Hall—one of Canada's largest and most successful beekeepers—is quoted as follows:

"We hived every swarm on half combs and half foundation, full sheets of foundation, four sheets to the pound, placing the old colonies alongside the new swarms, six or seven days after we shook all the young bees that had hatched in that time into or in front of the swarm, making it very strong, and took the brood away and hived a swarm on it. There were no eggs and little or no uncapped larvae. Every swarm of bees we put upon those combs stayed and went right to work. We carried that out throughout the season. We started with 200 colonies of bees and we finished with 212, and we took 25,000 pounds of honey."

Previous to what I have quoted he said that this was comb honey. I was much impressed with this plan, and the results obtained from it, and last season I tried it in quite a large way, but the whole thing was practically a failure in my hands, compared with the results I can obtain in other ways, and it would no doubt be of interest to many if others who tried the plan last season would report results. I do not mean that the plan may not be all right—I only wish to insinuate in a mild way so as not to injure my own feelings too much, that I do not know enough to make the method a success. With me, swarms would in some cases refuse to stay on those combs containing, as they did, and must when this plan is practiced a great deal of sealed brood. If forced to stay by an entrance-guard or clipped queen they did not work with anything

like the vim and energy that a swarm hived on starters would, and the results in section work was less than even the languid, indifferent way in which they in some instances worked would lead one to expect.

The method, in brief, by which I can obtain the best results in section work with swarms, either natural or artificial ones, if, as is the case with me, sections filled with white honey is the object sought, regardless of increase or stores in the brood-chamber, is to have a large force in one hive with small starters in the brood-chamber, and use full sheets in the sections. The queen, if a good one, will occupy most of the comb below as fast as it is built, so the honey must of necessity be stored in the sections; and, what is of more importance, the bees under this system work with great energy from the start to the end of the flow.

There are some disadvantages about this plan, such as pollen in sections some seasons, and all seasons a good deal of drone-comb below.

Southern Minnesota.

Bee-Keeping on the Island of Sicily.

BY F. GREINER.

THE peasants of Sicily, in particular those living along the Southern coast of the island, have followed bee-keeping as a business for a great many years. The movable comb and the divisible brood-chamber have been in use among them for centuries. Indeed, it would be difficult to trace up who the originator, or originators, of their hives and methods were.

The bee-knowledge these people possess has been transmitted to them by the Greeks and Romans, and, according to their ideas, can not be improved upon, putting Dzierzon, Langstroth, Hoffman and Heddon clear into the shade. From the following the reader can judge for himself. The Long-Idea-Hive is the hive in use; and long it is—only about five feet long, single story, of course. The size of frame is eight inches by eight inches in the clear. The frames themselves are made of a sort of bamboo species, Ferula. This bamboo is selected of such thickness as corresponds with the thickness of the combs, or about 1½ inch. It is said that the bees build their combs into these frames with regularity without any other comb guide than the natural shape (rounding) of the material they are made of.

The peculiar feature of the hive is, that the frames form the hive. Nothing more simple could be thought of in the shape of a frame hive. Of course the frames must all be of exact size; they are fastened one to the other by small wooden pins. As many as 42 such frames are thus united, and all the interstices and joints are filled and covered with a mixture of clay and fresh droppings of cattle in order to exclude insects and rain. Only two small entrances at one end are provided for this 8-foot tunnel.

The method of managing these hives is as unique as are the hives themselves. It is a well known fact that the brood-nest in a hive is generally located near its entrance, the honey being stored in the further end. So, accordingly, if honey is wanted, a part of the frames from the end opposite the entrance are separated, and empty ones are substituted; if increase of bees is desired, a part of the frames at the front are separated, and thus the division is made.

The dead-air spaces in the frame material, as well as the covering above mentioned, seem to be sufficient protection to prevent the melting down of the combs, even in as hot a climate as Sicily.

Ontario Co., N. Y.

P. S. The above information was gained from an article written by V. Rauschenfels, in Imkerschule.

F. G.

Rearing Queens—Help for Those Who Fail.

BY G. M. DOOLITTLE.

A CORRESPONDENT writes as follows: "I have attempted, the past summer, to rear queens as you give in your book, but the bees refused to accept the prepared combs. As far as I know I have followed your directions. Where does the fault lie, with me or the bees?"

It seems a little strange that about one in 100 who try the plan of rearing queens as given in my book make a partial or entire failure of it. Of the other 99 who try, ninety report a perfect success, while the other nine are puzzled and perplexed over not being able to do better than to secure from three to five perfect queens out of every lot

of cell-cups tried. But while this is so, there is one thing worth mentioning, which is, that the longer those who have poor results try the plan, the better they succeed. From this I feel compelled to say that the fault, when a failure occurs, must be in the operator, for, so far as I am aware, bees behave very much the same along this line of cell-building, whether it be in York State, Maine, Florida, California, Canada, Europe, Australia, or Africa, as I have reports of perfect success and also of failures from all the places mentioned, and from many others also. If any man or woman makes a perfect success of the plan in Ohio, should not another make the same success in Ohio, providing he did *exactly* the same thing?

As 90 out of 100 make a success with the plan, it would look as if those who make a partial or entire failure in the matter, failed, in some respect, to work in all the minutia of the matter, in the same way the successful ones do.

As I mistrust that more fail in the matter of transferring the larvæ than anywhere else, I am constrained to give the fullest possible directions in this matter.

To those who have not succeeded as they desire, I would say, make a colony queenless and then wait three days till queen-cells are formed having plenty of royal jelly in them, and, after having removed the larvæ occupying these cells from the royal jelly, transfer larvæ from your select breeding queen to the royal jelly, left just as you removed the original larva from it, marking the cells worked upon by sticking an inch and a quarter wire nail about a half inch above every cell thus grafted, when you will return the combs to the bees. If this is a success you may know that there is no trouble on your part in the transferring process; but should it not prove successful you may rest assured that you killed the larvæ in some way in manipulating them, for with me every one is accepted under such circumstances.

If you succeed here, try the same way again, only set the frame having larvæ transferred to the cells built by the bees, in the upper story of a tiered-up colony; and, if I am not greatly mistaken, you will succeed here also, unless your trial is made in early spring or late in the fall. If you succeed in this way and can not with the artificial cell-cups, then you may know that there is some mistake in your manipulation of the royal jelly, or else the wax used in forming the cell-cups is offensive to the bees, or not fashioned as it should be in some way. To find out which of these is the cause of failure, instead of using royal jelly, transfer the larvæ to the cell-cups by the Willie Atchley plan of removing cocoons—larvæ and all to the cell-cups. If you now succeed you may know that the trouble was in manipulating the jelly. If you do not, then the cups are at fault.

If you have made no success with any of your trials till you transferred the larvæ by means of the cocoons, then you may know that you handled the larvæ in transferring in such a way that you killed the same, and here is where you are to look for the trouble. If you know that you failed in handling the larvæ, allow a few suggestions:

Make the point of the quill used in transferring very thin and three-thirds-seconds broad, rounding the extreme point. Having this done, give the point much curve by soaking it in water for some time and then pressing it, while soft, on the thumb-nail till it will fit the bottom of worker-cells nicely, when it should be laid away for 24 hours.

Now, before trying to transfer the first larva, dip the point in royal jelly till it is thoroughly moistened with the same, when you will note that, as you pass it under the larva, said larva is floated up on this royal jelly adhering to the curved point of the quill, so that it does not touch the quill at all, so can not be injured if you use any care in setting it down in the royal jelly in the cell-cups. If you are bothered about seeing, shave the piece of comb containing the larva down almost to the septum of the comb, or base of the cells, when no one should have any difficulty in seeing perfectly who can read the print of these pages.

But perhaps you tried the plan of queen-rearing too early in the spring, or during cool weather in September or October. Or perhaps you did not feed the colony when honey was not coming in from the fields, or did not have unsealed brood in the upper story; any or all of which would tend toward a failure.

If the weather is cool and no honey coming in from the fields, the bees should be fed till they are all alive and active, the same as they are when honey is coming in from the fields and at swarming-time; for, if we would rear

good queens at any time of the year these conditions should be brought about as nearly as possible.

Of late years, for spring and fall rearing, I slip a sheet of perforated zinc down into the hive so as to confine the queen to one side of the same, when queens are reared in the other side, or the side not having the queen, the same as in upper stories. This can be done when there are not enough bees to fill properly two stories so as to rear queens to the best advantage. Onondaga Co., N. Y.

Questions and Answers.

CONDUCTED BY

DR. C. C. MILLER, Marengo, Ill.

(The Questions may be mailed to the Bee Journal office, or to Dr. Miller direct, when he will answer them here. Please do not ask the Doctor to send answers by mail.—EDITOR.)

Transferring Bees from Box-Hives.

1. I have several colonies of bees in box-hives that I wish to transfer to movable-frame hives. They have each considerable honey in the brood-chamber, and I suppose brood also. Would it be as well, or better, to do it now (Aug. 5), or wait till next swarming season?

2. In cutting the combs to fit the movable frames, which end of the combs would be best to trim off and throw away, if any—the upper or lower edge? Supposing the combs are too deep for my frames for one, and not deep enough for two.

3. Would there be any danger of robbing, were I to undertake this job, on account of my hives being situated so close to each other? They are only about three or four feet apart in rows.

4. If I find any of them too weak to protect themselves from the moth, could I safely unite two or more weak ones at the time of transferring?

5. My hives are scattered over a lot of about 1-16 of an acre. How would be best to bring the hives together for uniting? and should I take one and carry it to another to be there united and transferred? Suppose No. 5 and No. 10 are two weak colonies, and I wish to unite and transfer them at the same time from their box-hives to movable-frame hives. Must I take No. 5 and carry it to No. 10 to be proceeded with?

6. Ordinarily, when two colonies are desired to be united, how would it do to move at night, one of them, to the side of the other, and wait a few days till the moved colonies become accustomed to the location, before uniting them?

7. Is it too late in the season for bees to build comb? If your answer should be no, I wish to ask why have my bees not rebuilt the combs I robbed them of a month ago?

8. Is there any limit to the time of comb building?

9. If you advise transferring from the box-hives now, when must I remove the wire or strings used to hold the combs in place in the movable frames?

10. Will it make any difference whether the comb is placed in the movable frames in the same position it has in the box-hives? That is, which side or edge goes up or down?

11. How am I to overcome the trouble of the bees of each hive returning to the old stand? If I move one hive to another to be united, won't the bees of the hive moved be apt to return to the old stand before they get used to the new order of things?

I read all the standard bee-books and it seems I ought to be able to answer all these questions myself, but these little points are not covered in the works on these subjects. I have about 30 colonies in box-hives, and about the same in movable-frame hives, and wish to transfer them now if you so advise, or wait till next swarming-time. I greatly fear robbing may get started. I have handled bees for three years, and can do the work all right if given the advice asked for. MISSISSIPPI.

ANSWERS.—1. It will probably be better to wait till next season.

2. That depends on the combs. Very likely the lower part will be best to retain. Cut away the lower edge so it will fit perfectly true on the bottom-bar, and then cut away

enough of the upper part to make a snug fit in the frame. If, however, there is drone-comb at the lower part and none above, of course you will discard the lower part.

3. There is as much danger of robbing at three rods apart as three feet.

5. It will need great care, especially if done late this season. If the hives stand close together the danger will be less.

5. Don't try to unite and transfer at one operation two colonies that are a considerable distance apart. Get them located together first.

6. Your idea is all right, only moving at night will not be any different from moving in daytime. You can't fool the bees by that trick. But you may shut up at night the hive to be moved, keeping it shut up for 24 hours (look out you don't smother them), then move them to the new place at once, or any time within the 24 hours, and pound on the hive so as to stir them up thoroughly before opening.

7. It is never too late to build comb if it is needed, and the reason your bees build none is without doubt because they need none. Even if you take a comb right out of the middle of the brood-nest, the vacancy will be allowed to remain if they have so much room elsewhere that they are not desirous of more.

8. No, in rare cases where there is special reason for it, they may build comb in winter.

9. Almost any time at your own convenience. If you use strings the bees will remove it themselves, although it will be a help to them if you find it convenient to remove it. If you use fine wire, it will do no harm if you leave it for weeks, so you can remove it any time you happen to have the hive open. Either wire or strings may be removed just as soon as the bees have fastened the combs in the frames just a little. In the working season, this will be in a day or two. It is a good plan to look at the work in a day or two, for sometimes the combs will not be located centrally in the frames, and you can easily crowd into place before they are too firmly fastened in.

10. Yes, and no. The part of the comb that is used for brood-rearing will be about the same when turned upside down, but the deep cells in the upper part of the frame that may have been used for storing honey will be found to slant so much that the downward slant will be objectionable when reversed. It will also give the bees some trouble to cut down these deep cells to the proper depth for brood-rearing. So it will be well to try to keep the combs right side up, but if it makes much inconvenience to do so put them in any way that comes handy.

11. As already mentioned, if you shut up the bees for 24 hours it will greatly help to make them stay in the new place. If the bees are made queenless a day or two before moving, they will stay better in the new place. When the change is made, make the old spot look as unlike home as possible by taking away the stand, and perhaps making other changes. Or, you may do nearly the reverse of this. Leave on the old stand a hive with a frame of comb in it for any returning bees to cluster on, and in the evening return them to the new place. You will not need to repeat this many evenings.

"The Hum of the Bees in the Apple-Tree Bloom" is the name of the finest bee-keeper's song—words by Hon. Eugene Secor and music by Dr. C. C. Miller. This is thought by some to be the best bee-song yet written by Mr. Secor and Dr. Miller. It is, indeed, a "hummer." We can furnish a single copy of it postpaid, for 10 cents, or 3 copies for 25 cents. Or, we will mail a half-dozen copies of it for sending us one new yearly subscription to the American Bee Journal at \$1.00.

Please send us Names of Bee-Keepers who do not now get the American Bee Journal, and we will send them sample copies. Then you can very likely afterward get their subscriptions, for which work we offer valuable premiums in nearly every number of this journal. You can aid much by sending in the names and addresses when writing us on other matters.

Queenie Jeanette is the title of a pretty song in sheet music size, written by J. C. Wallenmeyer, a musical bee-keeper. The regular price is 40 cents, but to close out the copies we have left, we will mail them at 20 cents each, as long as they last.

* The Afterthought. *

The "Old Reliable" seen through New and Unreliable Glasses.

By E. E. HASTY, Sta. B Rural, Toledo, O.

TRYING TO CORRECT POPULAR TERMINOLOGY.

No, Prof. Cook, it's entirely a waste of energy to try to make the general public quit saying "worms" and "bugs" for larvae and beetles. To give up the effort is the only sensible thing that can be done—excepting of course in distinctly scientific papers. The people have won a great many such fights with specialists—the betting on their side 100 to 1. The people love short, smoothly-sounding words; and "larvae" is "out of court" to begin with, by its un-English look and sound. Worse than all, many folks take a revengeful delight in using words that they know scientists "froth at the mouth" about, to pay them up for the jaw-crackers they have made us, and which we all have to mouth because there is no alternative word. Deep and penitential reform will have to begin with the Solons themselves before the people will seriously *think* of reforming. Page 470.

MOVING BEES TO BUCKWHEAT FIELDS.

F. Greiner has a decided "method" in getting bees to the buckwheat fields. One would be tempted to think it would run off the track at the same point, and be less satisfactory than the old "just move 'em" method; but his assurance that he finds it an improvement, and can recommend it to others, should go a good way. (Forced swarms carried on empty combs, reuniting later or not reuniting later according to circumstances, and according to one's desires in regard to increase.) Page 484.

HIGH VALUE OF QUEENS DEFENDS ON THE OWNER.

As to the \$200 queen racket, I guess I won't say much—just stand by and laugh. O yes, there's one thing I will say. The real cash value of an extra queen depends most of all on who has her. Page 484.

THE BLACK BEE AND CAREFUL BREEDING.

Black bee never coddled, and fussed with, and "bred" as the Italian bee has been. You're right about that, Mr. Braddeus Smith. If somebody would breed out their miserable habit of running down and dropping in little bunches from the comb, the black bee would be an admirable and desirable variety. "Spects the real gains of bee-breeding are mostly in the future (if anywhere), and may be the black bee will get an even chance yet. Page 486.

BEES TOO LONG QUEENLESS.

So the circumstances may be such that bees left too long queenless before giving a cell get so excited and lunatic on the subject that they will all take their young queens and go when said queens do emerge. We will do well to make a note of it. I doubt somewhat whether they waited for wedding-tight, as Dr. Miller suggests. I may be quite wrong; and anyway that is not important. Page 488.

MULBERRY HONEY.

Fruit honey has a dreadful reputation for killing bees in winter; nevertheless a fruit 87 percent sugars, and affecting the human palate as a pure sweet, may deserve further trial. Would have to go it pretty strong in raising mulberries else the birds would harvest them for you. Say, try them in Southern California, where there is no wintering problem except to ward off starvation. Destroy the brush surrounding the bee-ranch and cover the hillside with mulberry bushes. Then when a famine year comes let the bees go to harvest for themselves. Page 493.

SOME "HOT" POETRY REVIEWED.

If it were a youth publishing a poem for the first time I'd have mercy, but (having a little of the David and Goliath spirit) I'm going to go for Eugene Secor as he stands on page 514.

"And flowers to yield the dainty drop
Which heat and drouth have caused to dry up."

That is not doggerel; it's prose. The writer should have taken timely warning from the fate of Stenoz, whose *shu* was smaller than this one. Usually false rhyme and lame metre and reckless changes of form go in company with emptiness

of thought and substance; but it is not so in this case. The thoughts are not all above criticism, but there is a good supply of them, some of them rather striking. The trouble seems to be that he was too mortally lazy (probably on account of some hot July days) to correct the metre of a few lines.

"Is praying in animal language for rain."

is a nice amphibrachic line—but, as there isn't another one in the poem, it rather jars us when as rocking back and forth in iambs we unexpectedly come upon it. The time has entirely gone by when one could afford to be "slouchy" in the technical finish of his published poetry.—[We thought some one else would "straighten out" this matter, so we let the "poem" appear just as it was written. Hot weather is often responsible for over-heated brains—and some other things.—EDITOR].

COLONY AND PRIME SWARM "REPEATERS."

On page 493, C. H. Harlan contributes an extreme case of the repeating of both prime swarm and old colony. One year in the long ago (not very far from 35 years ago) we had the same sort of swarming here. It was a warm and showery summer; and the crop that year was not very large. I have no records going back so far as that, and so can not tell whether his bees made better time than ours or not.

* The Home Circle. *

Conducted by Prof. A. J. Cook, Claremont, Calif.

THE BIBLE.

To our friends—all the American Bee Journal home circles I count as my friends—we enjoy to talk of those we love, of what we love. A man of old who had visions of truth said, "Out of the abundance of the heart the mouth speaketh." What more fills our hearts than our real, true friends. We *must* talk of them. What will make the genuine American patriot light up with gladness and enthusiasm? The mere mention of such names as Washington and Lincoln. They were—ever will be—glorious friends of us all. How our eyes brighten, and how our faces kindle at thought or mention of them. How our tongues are loosened as we speak of the nobility and grandeur of their lives. They were friends whose blessed acts touch each and every one of us with blessings that ever grow with the ages. We ought, we must, we will, always sound forth their praises with most hearty accents and with fullest accord. It is good for us and the world that we are all ever ready to voice their incomparable virtues.

And so our friends in all the walks and relations of life must be in our words, as they are in our hearts. We must voice the praises of our country, our State, our neighborhood, the dear ones of the home circle. Why will the coming reunion of bee-keepers at Buffalo be such a glad occasion? Why will all be so enriched, and why will all we that stay at home lose so much? Only because we love our work, and we love to talk of its needs, its successes, its projects. To talk of these to those who are so fondly enlisted as are we, gives new impetus to our life and work.

I love my new home in Southern California. If we may judge from its rich gifts, it loves me. Ought I then to tire in singing its well-merited praises?

In my visit to the home circles last week, I referred to a friend who, like its Author, is "too wise to err; too good to be unkind." Who next to its Author is our very best friend. Who with its Author is ever coveting for us the best gifts, and ever urging us to such life and action as will as surely bring such gifts, as will the breathing of pure air bring life and vigor to our bodies? I hardly need say that I refer to "The book of books"—the blessed Bible—for there is no other such friend.

Few of the blessings of my childhood and early youth rank at all in my esteem with the fact that daily I heard my dear old father read from God's Word. To-day the very accents and the oft-repeated comments on various passages are

among my most treasured memories. Had my very busy father neglected this opportunity, how much of richest value and blessing would have been omitted from my life. Thus early I learned to love the grand old volume. In all my college life it was my daily companion, and ever urged me to my best work. Later, as I came to California, it came with me as my dearest friend; and as I went to teach, away up in the mountains, in a rude mining town, where there was no church and no profession of Christianity, its aid stayed by me.

As I started a Sunday-school, and gathered the dear, eager children together, it was from choice my first and best, and most excellent, assistant. There were great temptations in those days. But there were two precious friends ever close, to sound in my ear the ringing word, "Don't." Need I say that these were the mother-love and the blessed Word? I am glad that later my own home repeated the good habit of my father's home: that my children, like his, daily heard the blessed word of truth. I rejoice that my own children, who now have their own homes, and their own special temptations, continue the habit. This, of course, takes them to the Sunday-school, and makes them its earnest supporter.

Oh, it is a good and a blessed thing for all our children to receive into their hearts and lives the blessed truths of this most blessed of books. I wish I might be so happy as to say the magic word that would open its pages, and speak its saving messages in every home circle of our land! What a power this would become, to check untruth, to stay dishonesty, to snatch away the victims of idleness and the horrid saloon; to wipe out the foulest blot of all on our history's pages—the sin of impurity and the blasting social evil.

How certain is it that the authors of this grand book spoke as they were moved by the Spirit of God, else we would not have had the oft-repeated invitations to what all experience proves to be the highest virtues—would not have been urged over and over, to a life that all experience shows will bring happiness; would not have been warned, almost on every page, against those evils and sins which surely imperil the soul. How black is untruth and dishonesty; how thick the Bible warnings to thrust them wholly from our lives and thoughts. How blasting and full of menace is intemperance and lust, and how over and over the dear old Book points the warning finger, and says, "Touch not."

Oh! I would not only read it, but with the children I would learn so we could often repeat the Ten Commandments, the many grand passages from Isaiah, such Psalms as the 1st, 8th, 19th, 23d, 24th, 121st, etc. Such portions of the New Testament as the Beatitudes, yea, most of the Sermon on the Mount, the 12th Chapter of Romans, and 13th of 1st Corinthians. "For if these be in us and abound, they would make us that we could not be barren or unfruitful."

That grand chapter from Paul's great heart—the 13th of 1st Corinthians—is almost enough in itself to guide us in all life's perplexities. Learned aright, and we can not go astray. I like to repeat it often together about the morning table. It is easy, by use of such transcendent passages as these, to show our dear children the glories of this the very Word of God, that they will hunger to know more of its divine truth, which, if well and rightly learned, will make us all "wise unto salvation."

JAMES WARREN SHERMAN,

29A13r SAG HARBOR, NEW YORK.

BEES WAX

We will pay 20c. cash, per lb. for pure, bright yellow beeswax, and 20c. cash, per lb. for pure, dark beeswax delivered here, CHAMBERLAIN'S MEDICINE CO., Des Moines, Iowa.

27A13r Please mention the Bee Journal.

Bees Did Better this Year.

Our bees have done better this year than for two or three years past, after all the dry, hot weather. We commenced the spring with 11 colonies, and increased to 17. We have taken off over 500 pounds of comb honey, and have about 150 pounds on the hives yet to take off, which is pretty good for this locality. We can sell our honey at a pretty good price—comb honey at 20 cents per pound, and extracted at 10 cents; and customers furnish their pails.

RICHARD CHINN.

Dixon Co., Nebr., Aug. 29.

Working on Buckwheat.

Bees are working on buckwheat and queen-of-the-meadow at present. I have taken off nearly 40 pounds of honey per colony, so far.

HOWARD H. HOUSE.

Omeida Co., N. Y., Aug. 21.

Horsemint.

I send a flower that grows here on the sand hills. The bushes are just covered with bees from morning till night. I think it gives considerable honey, although a light amber.

HENRY RORDA.

Cook Co., Ill., Aug. 19.

(The plant in question is the horsemint—Monarda punctata—and belongs to the large and important mint family, the members of which are usually aromatic and honey-producing. A goodly number of these plants blossom from July to November in sandy fields and dry banks, and furnish a rich supply of nectar for the bees during the drouth season.—C. L. WALTON.)

Continued Drouth.

No rain yet. We never experienced such a drouth. Bees may get enough to winter on.

E. T. FLANAGAN.

St. Clair Co., Ill., Aug. 30.

Season in North Carolina—Dollar Queens.

This has been the wettest and driest season I ever saw. Up till July 1 it rained nearly all of the time. Then there was a drouth for nearly five weeks, so we have had a short honey season. The linden bloom commenced to open about July 4, and was very rich in nectar for about 15 or 20 days, then the sourwood commenced to yield nectar, and was never better, until the rain set it off, two weeks ago. It has rained nearly every day since. Some bees are in very good condition. I never saw better prospects for a fall crop of honey, the fields and woodland being covered with honey-yielding weeds. I have taken only about 1400 pounds of fine honey up to date, mostly extracted. I will make more in September, if the weather is favorable.

I want to say a few words in regard to "dollar queens." In my opinion nothing else has done as much harm to the bee-business as this sale of one dollar queens. They are reared for the trade, not for business. A queen ought not only to be tested for purity, but for business in egg-laying, and that her bees are honey-gatherers, before she is offered to the public for business. If each queen had a good guaranty for egg-laying, her bees for honey-gathering and hardiness for wintering, it would improve the bee-business more than any other one thing that could be done, in my opinion. Let us hear from some of our big

—BEST—

Extracted Honey For Sale

ALL IN 60-POUND TIN CANS.

Alfalfa Honey

This is the famous White Extracted Honey gathered in the great Alfalfa regions of the Central West. It is a splendid honey, and nearly everybody who cares to eat honey at all can't get enough of the Alfalfa extracted.

Basswood Honey

This is the well-known light-colored honey gathered from the rich, nectar-laden basswood blossoms. It has a stronger flavor than Alfalfa, and is preferred by those who like a distinct flavor in their honey.

Prices of Alfalfa or Basswood Honey:

A sample of either, by mail, 10 cents, to pay for package and postage. By freight—two 60-pound cans of Alfalfa, 8 cents per pound; four or more cans, 7½ cents per pound. Basswood Honey, ½ cent more per pound than Alfalfa prices. Cash must accompany each order. You can order half of each kind of honey, if you so desire. The cans are boxed. This is all

ABSOLUTELY PURE HONEY

The finest of their kinds produced in this country.

Read Dr. Miller's Testimony on Alfalfa Honey:

I've just sampled the honey you sent, and it's prime. Thank you. I feel that I'm something of a heretic, to sell several thousand pounds of honey of my own production and then buy honey of you for my own use. But however loyal one ought to be to the honey of his own region, there's no denying the fact that for use in any kind of hot drink, where one prefers the more wholesome honey to sugar, the very excellent quality of alfalfa honey I have received from you is better suited than the honeys of more marked flavor, according to my taste.

McHenry Co., Ill.

C. C. MILLER.

Order the Above Honey and then Sell It.

We would suggest that those bee-keepers who did not produce enough honey for their home demand this year, just order some of the above, and sell it. And others, who want to earn some money, can get this honey and work up a demand for it almost anywhere.

To make cows pay, use Sharples Cream Separators. Book "Business Dairying" & Cat. 212 free. W. Chester, Pa.

Langstroth on... The Honey-Bee

Revised by Dadant—1900 Edition.

This is one of the standard books on bee-culture, and ought to be in the library of every bee-keeper. It is bound substantially in cloth, and contains over 500 pages, being revised by those large, practical bee-keepers, so well-known to all the readers of the American Bee Journal—Chas. Dadant & Son.

Each subject is clearly and thoroly explained, so that by following the instructions of this book one cannot fail to be wonderfully helpt on the way to success with bees.

The book we mail for \$1.25, or club it with the American Bee Journal for one year—both for \$1.75; or, we will mail it as a premium for sending us **THREE NEW** subscribers to the Bee Journal for one year, with \$3.00.

This is a splendid chance to get a grand bee-book for a very little money or work.

guns in this respect. Don't understand me to mean that there are no good queens—there is about one good one in 50, according to my experience. I have bought more than that number, and only one was of any value worth mentioning. Bees in state of nature don't have their dollar queens but one season, for they fall by the wayside the first winter, as only the fittest survive.

I have been in the bee-business for 33 years, and have learned some things, but there is much to learn yet. A. J. McBRIDE.
Watauga Co., N. C.

Too Dry for Honey-Production.

I think the American Bee Journal is splendid, and I don't think I could do without it. We have but little honey in north Texas this year, as it has been too dry. I have 20 colonies, and will have to feed some of them.

B. F. TINDLE.

Dallas Co., Tex., Aug. 28.

Mulberry Pulp for Bees.

Yes, as Dr. Miller says, page 550, "It would probably take a good deal to make old bee-keepers believe that bees could store good honey from the pulp of any fruit."

Then, again, some of them would be sufficiently industrious and investigating, when, lo! they may learn that pulp from white mulberries, containing, as they do, 87 percent sugar, would reveal mysteries in honey-gathering that would astound them!

We live in an age chock-full of surprises, and old bee-keepers may as well wake up to the fact before their children urge it upon their attention.

And as the experiment of planting a hundred cuttings of white mulberry would be hardly a dollar, and not such a beloved seer in bee-lore—our esteemed Dr. Miller—do a worthy act to employ his benign influence in encouraging his readers at least to attempt a venture that at its worst would leave bee-keepers in possession of delightful shade-trees, serviceable timber, and delicious fruit?

I know that the best impulses of his good heart strongly tend in this direction, but years of observation have compelled sober discretion, even to timidity and distrust, I fear.

But let courage and hope, yea, faith also, lead on to untried but reasonable measures, trusting, thereby, to develop resources hitherto unknown. It is to spirits possessing these qualities we owe most beneficent discoveries.

DR. FERRO.

Against Zinc Honey-Boards.

It is not very often that I give my views on the methods of manipulating bees, but as each bee-man plods along the dusty road to fortune, if he sees, or thinks he sees, something in the shape of a mote in his brother's eye, he forthwith proceeds to pluck it out, or at least feels he ought to do so.

I do not use honey-boards. The queen has the liberty of the hive. I do not use them because they are in the way of the workers. The field-bee comes in heavily loaded, tired

Catnip Seed Free!

We have a small quantity of Catnip Seed which we wish to offer our readers. Some consider catnip one of the greatest of honey-yielders. We will mail to one of our regular subscribers **one ounce** of the seed for sending us **ONE NEW** subscriber to the American Bee Journal for a year with \$1.00; or will mail to any one an ounce of the seed and the American Bee Journal one year—both for \$1.30; or will mail an ounce of the seed alone for 35 cents.

out. She falls heavily at the entrance of the hive. Is it not hard enough to climb into the upper story without crawling through a narrow crack in a zinc board? If you do not think so, try crawling through a fence where one board is off, with a load of stove-wood for your wife, while she is crying to you to hurry up. It is a similar case.

Who recommends honey-boards? The successful bee-keeper? Not he. Those who have the largest yields in this locality per colony refuse to use them.

If the queen lays eggs in some of the combs in the upper story, do not extract from them, but as soon as they are ready to hatch use them for strengthening nuclei. Or, if you extract from them, turn the machine very gently. Strain your honey, and by all means settle and skim it. It is more important to honey settle in a tank for a week, if not more, than everything else.

A writer in Gleanings in Bee-Culture makes the assertion that the workers of a colony do not kill the drones. He says they commit suicide. I am glad to hear this. Murder is a dreadful thing, even in the insect kingdom. As he is a bee-keeper of very high standing, I hope all the readers of the American Bee Journal will have more sympathy with the "lady" bees. At least try to think that instead of stinging their brothers-to-death they are hugging them, and trying to dissuade them from so rash an act.

The season has been good here in some localities, in places sheltered and away from the coast winds. But the amount of honey produced will not inflate the market in the East, if it does here. Most bee-men will hold their crop perhaps for a year.

T. ARCHIBALD,

23-37A2t

Where the Nectar Comes From.

Prof. B. Shimek says in Home and Flowers:

The nectar-glands are extremely variable in form, size, color, etc. In phlox it is the inner moist surface of the slight swelling at the very base of the tube of the corolla; in the columbine it is the surface of the innermost base of the spur on each of the five petals; in the larkspur, violet and pansy it is a part of the inner surface of the spur; in the barberry there are two orange-colored glands at the base of each of the inner petals, etc. In some cases the nectar is produced in such quantities that it can readily be tasted.

Nectar-glands, however, are not always conspicuous, indeed as a rule they are more or less concealed, and other means must be employed first to secure the attention of the insect. This is most commonly done by special odors and by color. Very often both color and odor attract insects, as in roses, lilac, etc., but the buckthorn, mignonette and other inconspicuous flowers secure recognition chiefly by their color.

Bee-Keeping as a Sole Business.

One of the questions likely to occur to every young bee-keeper who has made a substantial success with a few colonies of bees may be worded in some such terms as the following: "Can I make a good living at bee-keeping alone?" On this account comes very frequently the question as to what may be depended upon as the average yield or profit from a single colony of bees, or the question, "How many colonies of bees shall I need so that I may depend upon them alone for a living?"—questions which no man living can answer definitely.

C. Davenport gives the matter some discussion in the American Bee Journal, and settles the question as to whether one can make a living at bee-keeping alone by saying he has done it. But he says his is a good locality, and that he has no wife or family to support, and adds, "While I would not advise a young man to take up bee-keeping as a life work, in my opinion there is no question but that a

living can be made at it in a good locality if one understands the business."

While he may be entirely right in this, there are those who would not be in accord with his ideas when he says: "If I had my life to live over I would not be a bee-keeper; for I believe the work I have done to make what might be called a success in our pursuit would, in some others, have resulted in better success financially, and also in other ways." It is just possible that, if Mr. Davenport could live his present life through, and then live another life without bees in some business at which he could make more money, he might give his judgment as follows: "I must say that, after having lived the two lives so that I am now able to judge between them, I prefer the bee-keeper's life, which, although giving less opportunity for amassing wealth, gives one the opportunity for a greater amount of happiness."

Taking the expressions of some of the veterans who have been in the business many years, we might suppose one of them near the close of life to express himself as follows:

"Judged from the standpoint of those who measure success in life only by the amount of wealth accumulated, my life has not been a great success. Folks compare me with my brother John, and have a feeling for me akin to pity. John and I started life with equal chances; and if I may be allowed to judge, John had no more business ability than I. He went into merchandizing, and devoted all his energies to making money. He said he did not care for money, only as it would allow him to have something he could enjoy; and when he got enough he would give up the drudgery and enjoy life. But somehow he kept on piling up more and more, turning his business talents in this direction and that; and although to day he could buy and sell me many times over, I don't believe he enjoys life any better than I. I have all I can eat, and that's all he has in the way of food. He may buy dainties that I can not afford, but his dyspeptic stomach will punish him for eating them; and having spent so much of my time outdoors all these years, I have a hearty appetite that makes me relish plain and wholesome food more than he relishes dainties. The great difference, however, between John's life and mine is that, in the past years, his has been one of continual drudgery, and

No. 4 "Barler Ideal" Oil-Heater.

The "Barler Ideal" OIL=HEATER

Saves Its Cost Every Year!
NO ODOR! NO SMOKE! NO ASHES!

Costs only a cent an hour to run it.

The editor of the American Bee Journal is using the "Barler Ideal" Oil Heater, and it is all right in every way. We liked it so well that we wanted our readers to have it too, so we have recently arranged with its manufacturers to fill our orders. The picture shown herewith is the one we recommend for general use. It is a perfect gem of a stove for heating dining-rooms, bed-rooms, and bath-rooms. It hinges back in a substantial way, and is thoroughly well made throughout. The urn removes for heating water. The brass fount, or well, has a bail, and holds nearly one gallon of kerosene oil. It is just as safe as an ordinary lamp. You wouldn't be without it for twice its cost, after once having one of these stoves. Most oil-stoves emit an offensive odor, but this one doesn't. Its height is 2½ feet, and weighs 20 pounds, or 30 pounds crated ready for shipment, either by freight or express.

Price, f.o.b. Chicago, \$6.00; or, combined with a year's subscription to the American Bee Journal—both for only \$6.50. FULL DIRECTIONS GO WITH EACH STOVE.

If you want something that is really serviceable, reliable, and thoroughly comfortable, you should get this "Barler Ideal" Oil Stove, as it can easily be carried by any woman from one room to another, and thus have all the heat you want right where you want it.

QUEENS

QUIRIN—THE QUEEN-BREEDER—has now on hand, ready to mail, 500 young, long-tongued Red Clover Queens, Golden or Leather Colored.

We have one of Root's best breeders from his \$500, long-tongued, Red Clover Queen, and a Golden Breeder which we are told is worth \$100, if there is a queen in the U. S. worth that sum.

J. L. Gandy, of Humboldt, Neb., tells us that the colony having one of our queens, stored over 400 pounds (mostly comb) honey in a single season. A. I. Root's folks say that our queens are extra fine, while the editor of the American Bee Journal tells us that he has good reports from our stock from time to time.

We have years of experience in mailing and rearing Queens. Queens positively by return mail from now on. Prices for balance of season as follows:

	1	6	12
Selected	\$.75	\$ 4.00	\$ 7.00
Tested	1.00	5.00	9.00
Selected tested	1.50	8.00	

Extra selected test, the best that money can buy, 3.00

A HANDY TOOL-HOLDER!

Sent by Express, for \$1.50; or with the Bee Journal! one year—both for \$2.00.

Every Manufacturer, Miller, Carpenter, Cabinet Maker, Machinist, Wheelwright and Quarryman, Farmer, or any one using a grindstone, should have one of these Tool-Holders. One boy can do the work of two persons, and grind much faster, easier and with perfect accuracy. Will hold any kind of tool, from the smallest chisel to a draw shave or ax. Extra attachment for sharpening scythe blades included in the above price. The work is done without wetting the hands or soiling the clothes, as the water flows from the operator. It can be attached to any size stone for hand or steam power, is always ready for use, nothing to get out of order, and is absolutely worth 100 times its cost.

No farm is well-equipped unless it has a Tool-Holder. Pays for itself in a short time.

How to Use the Holder.

DIRECTIONS.—The Tool is fastened securely in the Holder by a set-screw and can be ground to any desired level by inserting the arm of the Holder into a higher or lower notch of the standard. While turning the crank with the right hand, the left rests on an steady the Holder; the Tool is moved to the right or left across the stone, or examined while grinding, as readily and in the same way as if held in the hands.

For grinding Round - Edge Tools, the holes in the standard are used instead of the notches.

GEORGE W. YORK & CO., 144 & 146 Erie St. Chicago, Ill.

BEE-BOOKS

SENT POSTPAID BY

George W. York & Co.

Chicago.

Bees and Honey, or Management of an Apiary for Pleasure and Profit, by Thomas G. Newman. It is nicely illustrated, contains 160 pages, beautifully printed in the highest style of the art, and bound in cloth, gold-lettered. Price, in cloth, 75 cents; in paper, 50 cents.

Langstroth on the Honey-Bee, revised by Dadant. This classic in bee-culture has been entirely re-written, and is fully illustrated. It treats of everything relating to bees and bee-keeping. No apiarist library is complete without this standard work by Rev. L. L. Langstroth—the Father of American Bee-Culture. It has 520 pages, bound in cloth. Price, \$1.25.

Bee-Keepers' Guide, or Manual of the Apizry, by Prof. A. J. Cook, of the Michigan Agricultural College. This book is not only instructive and helpful as a guide in bee-keeping, but is interesting and thoroughly practical and scientific. It contains a full delineation of the anatomy and physiology of bees. 460 pages, bound in cloth and fully illustrated. Price, \$1.25.

Scientific Queen-Rearing, as Practically Applied, by G. M. Doolittle. A method by which the very best of queen-bees are reared in perfect accord with Nature's way. Bound in cloth and illustrated. Price, \$1.00.

A B C of Bee-Culture, by A. I. Root. A cyclopedia of 400 pages, describing everything pertaining to the care of the honey-bees. Contains 300 engravings. It was written especially for beginners. Bound in cloth. Price, \$1.20.

Advanced Bee-Culture, Its Methods and Management, by W. Z. Hartmann. The author of this work is a practical and entertaining writer. You should read his book; 90 pages, bound in paper, and illustrated. Price, 50 cents.

Rational Bee-Keeping, by Dr. John Dzierzon. This is a translation of his latest German book on bee-culture. It has 350 pages, bound in paper covers, \$1.00.

Bienen-Kultur, by Theo. G. Newman. This is a German translation of the principal portion of the book called "Bees and Honey." 100-page pamphlet. Price, 25 cents.

Bienenzucht und Honiggewinnung, nach der neuesten methode (German) by J. F. Eggers. This book gives the latest and most approved methods of bee-keeping in an easy, comprehensive style, with illustrations to suit the subject. 50 pages, board cover. Price, 50 cents.

Bee-Keeping for Beginners, by Dr. J. P. H. Brown, of Georgia. A practical and condensed treatise on the honey-bee, giving the best methods of management in order to secure the most profit. 100 pages, bound in paper.

Bee-Keeping for Profit, by Dr. G. L. Tinker. Revised and enlarged. It details the author's "new system, or how to get the largest yield of comb or extracted honey." 80 pages, illustrated. Price, 25 cents.

Apiary Register, by Thomas G. Newman. Devotes two pages to a colony. Leather binding. Price, for 50 colonies, \$1.00; for 100 colonies, \$1.25.

Dr. Howard's Book on Foul Brood. Gives the McEvoy Treatment and reviews the experiments of others. Price, 25 cents.

Winter Problem in Bee-Keeping, by G. R. Pierce. Result of 25 years' experience. 30 cts.

Foul Brood Treatment, by Prof. F. R. Chessie. Its Cause and Prevention. Price, 10 cts.

Foul Brood, by A. R. Kohnke. Origin, Development and Cure. Price, 10 cents.

Capons and Caponizing, by Dr. Sawyer, Fanny Field, and others. Illustrated. All about caponizing fowls, and thus how to make the most money in poultry-raising. 64 pages. Price, 25 cts.

Our Poultry Doctor, or Health in the Poultry Yard and How to Cure Sick Fowls, by Fanny Field. Everything about Poultry Diseases and their Cure. 64 pages. Price, 20 cents.

Poultry for Market and Poultry for Profit, by Fanny Field. Tells everything about Poultry Business. 64 pages. Price, 20 cents.

mine has been one mainly of enjoyment. I've had my good times as I went along. Working at the bees has been just as good sport as going hunting or fishing, and it's a sport of which one never wears out. You see my way has not been something to look forward to in the future, but something I've had all along. No, with all his wealth I wouldn't swap places with John."

Some one may say, "That's very pretty talk; but my experience has been that there's hard work in bee-keeping, and lots of it." Sure. But isn't there hard work in nearly all kinds of play? Do you work any harder at bee-keeping than you do when you hunt or fish all day? Do you begin to work as hard as the man who plays ball (till he is as tired as a beet in the face, and is so sore and lazed at night that he can not be still?—Gleanings in Bee-Culture.

Doubling Up Storing Forces.

Under the head of "How to get the bees of two queens to work in one super," Jas. Hamilton gives in the Bee-Keepers' Review his plan of procedure. It contemplates uniting in such a way as to have only half of the colonies working in supers. While it might be very much better to have all colonies strong, there may be, and often are, cases in which all colonies are not sufficiently strong to make good work in supers, when some sort of uniting is desirable. In such cases Mr. Hamilton's plan is well worth considering. He says:

If you expect a honey-flow by the first of June, say, examine all your colonies and mark those that are strongest. They have the best queens. Do this some time previous. These colonies are the ones upon which you expect to put supers. Remove all combs not occupied with brood. Now go to your second weakest colonies, draw well-brooded combs therefrom, putting one in place of each empty comb taken from your best colonies, replace these empty combs where you drew the brood from. If your hive is an 8-frame, you now have 8 frames of brood in all of the strongest colonies. The bees in these hives will soon be so strong that you may put an upper story, which is simply to prevent over-crowding and to hold other frames of brood. This time I would draw two frames from each of the third weakest colonies, having two brood-frames in each hive having an upper story. I would also put one comb of honey beside these two brood-frames. This is to prevent the bees from starving, in case there might be a few cold or wet days.

Now each colony intended for comb honey has, all told, 10 frames of brood. The brood is rapidly hatching out, and by the time clover or basswood is ready the colony will be ready.

This is uniting in the brood form, and it is the form in which the work can be safely and easily performed. This force of brood will soon be young field-bees and will be good for a three weeks' honey-flow, or about as long as clover will yield.

But there is another plan, and I only recommend it when you have been negligent in the performance of the former and the season of the honey is high at hand:

Kill off the queens that have but the equiv-

Rocky Mountain Bee-Plant Seed!

(Clematis integrifolia.)

...FREE AS A PREMIUM...

The A B C of Bee-Culture says of it: "This is a beautiful plant for the flower-garden, to say nothing of the honey it produces. It grows from two to three feet in height and bears large, clear, bright pink flowers. It grows naturally on the Rocky Mountains, and in Colorado, where it is said to furnish large quantities of honey."

We have a few pounds of this Clematis seed, and offer to mail a 1/4-pound package as a premium for sending us ONE NEW subscriber to the American Bee Journal, with \$1.00; or 1/4 pound by mail for 50 cts.

alant of five frames of brood and bees. Four or five days later put on an upper story on each alternative hive of the class of colonies from which you removed a queen, alternating the frames of brood and bees, both in the lower and upper story, and there will be no fighting. If your hives are standing close in pairs, nearly all the bees will remain where you put them. At this time I would introduce a young laying queen to each of these double colonies. Let them thus remain until most of the brood is hatched. When the time for swarms arrives, contract the brood-chamber to five combs, give each colony a case of drawn comb or foundation, and watch the honey-flow. If it is slow, one super is enough. My faith in tiering-up is about torn up.

But to return to the second weaker colonies from which we drew our batch of brood. This class of colonies has each a second-class queen, a little patch of brood, and some field-bees. What shall we do with them? Let them alone until the time you expect your best colonies to swarm. At this time I would draw frames of brood from each colony likely to swarm, contract the brood-chamber to five frames, and use the frames of brood and weak colonies in building up colonies. Such colonies will do good work in closing up the season.

QUEENS

Now ready to supply by returned mail. STOCK which can not be EXCELLED !!! Bred under the SUPERSEDING CONDITION of the colony.

GOLDEN ITALIANS, the GREAT HONEY-GATHERERS. They have no SUPERIOR and few equals. 75c each; for \$4.00, RED CLOVER BEES, the LONG-TONGUED ITALIANS, which left all RECORDS behind in GATHERING HONEY, \$1 each; 6 for \$5. SAFE ARRIVAL GUARANTEED.

HONEY AND BEESWAX

MARKET QUOTATIONS.

CHICAGO, Aug. 22.—White comb brings 15c per pound for the choice grades, and other lines not grading No. 1 selling at 13¢14¢; light amber, 12¢13¢; dark, 10¢11¢. Extracted honey in car lots at 5¢4¢ for white, and 5¢4¢ for amber; dark grades, 5c. Beeswax steady at 3¢ for choice yellow. R. A. BURNETT & Co.

CINCINNATI, Aug. 10.—The honey market is rather dull on account of the warm weather. Extracted sells only to manufacturers from 5¢4¢; better grades alfalfa water-warm from 6¢7¢; white clover from 8¢9¢. Fancy white comb honey sells from 13¢14¢15¢. C. H. W. WEBER.

BOSTON, Aug. 19.—Our market to-day is about 10¢17¢ for fancy; A No. 1, 15¢16¢; No. 1, 14¢15¢. Extracted, full supply, light demand. Several lots of new imported honey in car lots have thus far been received, meeting a ready sale at 17¢, although of course in a small way. The trade generally seems disposed to hold off, looking for larger receipts and lower prices. This is somewhat due, of course, to the fact that the demand is still light owing to the warm weather. Cooler weather will make a better demand and naturally make a better feeling. BLAKE, SCOTT & LEE.

ALBANY, N. Y., Aug. 20.—We quote: Fancy white comb, 16¢17¢; No. 1, 15¢16¢; No. 2, 13¢14¢; mixed, 12¢13¢. Extracted, light, 7¢7½¢; mixed, 6¢7¢. H. R. WRIGHT.

OMAHA, Aug. 8.—New comb honey is arriving by express in small quantities from Iowa and Colorado, and selling at \$3.50 per case in a retail way. California extracted honey is being offered carlots at 4¢4½¢ per pound, f.o.b. California shipping-points, but we have not heard of any sales having been made thus far. The production of extracted honey seems to be quite large this year in Colorado, Utah and California. PEYCKE BROS.

NEW YORK, Aug. 7.—There is some demand for new crop of comb honey, and receipts are quite numerous for this time of the year. They have been principally from the South, but are now beginning to come in shipments from New York State and nearby. We quote: Fancy white, 15c; No. 1 white, 13¢14¢; amber, 11¢12c. No new buckwheat is on the market as yet, and we do not expect any before next month.

Extracted is decidedly dull. Plenty offerings, with only a limited demand, and quotations are rather nominal. We are selling at from 5¢4¢, according to quality, and New York extra 1b barrels at from 5¢4¢ per gallon. Beeswax dull and declining; for the present we quote 27¢28c. HILDRETH & SPOLEEN.

DES MOINES, Aug. 7.—There is very little doing here in new crop of honey. Some small lots of near-by produced comb honey are on the market and selling in a retail way at \$3.50 to \$3.75 per case. We do not look for much trade in this line before Sept. 1. Our market does not consume a great deal of extracted honey. PEYCKE BROS. & CHANEY.

DETROIT, Aug. 12.—Fancy white comb honey, 14¢15¢; No. 1, 13¢14¢; no dark to quote. Extracted, white, 6¢7c. Beeswax, 25¢26c. M. H. HUNT & SON.

BUFFALO, Aug. 10.—Quite a good demand for fancy honey, 9¢7c, and lower grades, 12¢14¢; old neglected. Address moderate shipments only of new as yet. BATTERSON & CO.

SAN FRANCISCO, Aug. 14.—White comb, 11¢12¢; grades amber, 8¢10¢; dark, 6¢7¢. Extracted, white, 5¢4¢—; light amber, 4¢4½¢; amber, 4¢4½¢. Beeswax, 26¢28c. Market quiet, with exporters, as a rule, unwilling to unload at prices generally named by wholesale operators. Quotations represent as nearly as possible the values ruling at this date for round lots, although free sales could not probably be effected at full figures, while, on the other hand, higher prices than quoted are being realized in the filling of some small orders.

KANSAS CITY, Aug. 6.—Some very fine Missouri honey is now on the market, selling at 16¢17c per pound for fancy white comb. Colorado and Utah shippers are offering new comb honey in carlots for first half of August shipment at 1¢ per pound. No. 1, and 9¢10¢; No. 2, f.o.b. shipping-point. The market for extracted honey is as yet rather unsettled, asking prices ranging from 4¢4½¢, f.o.b. shipping-point. Buyers, however, seem to be in a hurry to make contracts. PEYCKE BROS.

—THE—

Bee-Keeper's Guide

Or, Manual of the Apiary.

—BY—

PROF. A. J. COOK.

460 Pages—16th (1899) Edition—18th Thou-
sand—\$1.25 postpaid.

A description of the book here is quite unnec-
essary—it is simply the most complete scientific
and practical bee-book published to-day. Fully
illustrated, and all written in the most fascinat-
ing style. The author is also too well-known to
the whole bee-world to require any introduction.
No bee-keeper is fully equipped, or his library
complete, without THE BEE-KEEPER'S GUIDE.

This 16th and latest edition of Prof. Cook's
magnificent book of 460 pages, in neat and sub-
stantial cloth binding, we propose to GIVE AWAY
to our present subscribers, for the work of get-
ting NEW subscribers for the American Bee
Journal.

Given for TWO New Subscribers.

The following offer is made to PRESENT sub-
scribers only, and no premium is also given to
the two NEW subscribers—simply the Bee Jour-
nal for one year:

Send us TWO NEW SUBSCRIBERS to the Bee
Journal (with \$2.00), and we will mail you a copy
of Prof. Cook's book FREE as a premium.
Prof. Cook's book alone sent for \$1.25, or we club
it with the Bee Journal for a year—both for only
\$1.75. But surely anybody can get only TWO
NEW SUBSCRIBERS to the Bee Journal for a year,
and thus get the book as a premium. Let every
body try for it. Will YOU have one?

LOSS.
PATENT WEED-PROCESS SHEETING.

Why does it sell
so well? **

Because it has always given better satis-
faction than any other.
Because in 24 years there have not been any
complaints, but thousands of compli-
ments.

Send name for our Catalog, Samples of Foundation and Veil Material.
We sell the best Veils, cotton or silk.

BEE-KEEPERS' SUPPLIES OF ALL KINDS.

Very fine pure-bred BARRED PLYMOUTH ROCK Chickens and Eggs
for sale at very low prices.

Langstroth on the Honey-Bee—Revised,

The classic in Bee-Culture—Price, \$1.25, by mail.

Beeswax wanted at all times.

CHAS. DADANT & SON, Hamilton, Hancock Co., Ill.

Please mention Bee Journal when writing.

ANOTHER ENDORSEMENT

—FOR—

Root's Red Clover Queens

ALEXANDRIA, IND., Aug. 1, 1901.

THE A. I. ROOT CO., Medina, Ohio.

Dear Friends:—The tested clover queen came in good con-
dition and has filled seven frames with brood two weeks from the
day she arrived, which is better than the combined efforts of three
"yellow" queens purchased two years ago. I believe she is going
to be the counterpart of the queen purchased of you in 1896, in
which case money could not buy her.

Yours Fraternally,

EVAN E. EDWARDS.

PRICES OF RED CLOVER QUEENS:

Gleanings in Bee-Culture one year and Untested Queen \$2.00
" " " " Tested Queen 4.00
" " " " Select Tested Queen 6.00

If you want something good you can not do better than to
order one of these queens. All orders are filled promptly. No
extra postage on these to foreign countries.

THE A. I. ROOT CO., Medina, Ohio.

DR. A. B. MASON, Secretary, Toledo, Ohio.

EUGENE SECOR, General Manager and Treasurer, Forest City, Iowa.

MEMBERSHIP DUES, \$1.00 a year.

If more convenient, Dues may be sent to the office of the American Bee Journal, when they will be forwarded to Mr. Secor, who will mail individual receipts.

A Celluloid Queen-Button is a very pretty thing for a bee-keeper or honey-seller to wear on his coat-lapel. It often serves to introduce the subject of honey, and frequently leads to a sale.

NOTE.—One reader writes: "I have every reason to believe that it would be a very good idea for every bee-keeper to wear one [of the buttons] as it will cause people to ask questions about the busy bee, and many a conversation thus started would wind up with the sale of more or less honey at any rate it would give the bee-keeper a superior opportunity to enlighten many a person in regard to honey and bees."

The picture shown herewith is a reproduction of a motto queen-button that we are furnishing to bee-keepers. It has a pin on the underside to fasten it.

Price, by mail, 6 cents; two for 10 cents; or 6 for 25 cents. Send all orders to the office of the American Bee Journal.

A Superior Red Clover Queen

AN UNTESTED ITALIAN

For sending us One New Subscriber and 25 cents (\$1.25 in all).

We arranged with one of the oldest and best queen-breeders (having many years' experience) to rear queens for us this season. His bees average quite a good deal the longest tongues of any yet measured. The Breeder he uses is direct from Italy, having imported her himself. Her worker-bees are large, somewhat feather-colored, very gentle, and scarcely requiring veil or smoke. They stored red clover honey last season.

All queens guaranteed to arrive in good condition, and all will be clipped, unless otherwise ordered.

We would like each of our present readers to have one or more of these fine Queens, simply send us the name and address of a new subscriber for the American Bee Journal for one year, and 25 cents extra, and the Queen will be mailed to you. Our queen-rearers is now caught up with orders, and expects to be able to mail them hereafter within 48 hours after we receive the order. He is in another State, and we will send him the Queen orders as fast as we get them at this office. He is prepared to rear and mail a large number.

The cash prices of these Queens are \$1.00 each; 3 for \$2.70; or 6 for \$5.00. Send all orders to

GEORGE W. YORK & CO.,
144 & 146 Erie Street, CHICAGO, ILL.

25 cents Cash paid for Beeswax.

This is a good time to send in your Beeswax. We are paying 25 cents a pound—CASH—for best yellow, upon its receipt, or 27 cents in trade. Impure wax not taken at any price.

Address as follows, very plainly,

GEORGE W. YORK & CO., 144 & 146 Erie St., Chicago, Ill.

The Novelty Pocket-Knife.

Your Name and Address on one side—Three Bees on the other side.

[THIS CUT IS THE FULL SIZE OF THE KNIFE.]

Your Name on the Knife.—When ordering, be sure to say just what name and address you wish put on the Knife.

The Novelty Knife is indeed a novelty. The novelty lies in the handle. It is made beautifully of indestructible celluloid, which is as transparent as glass. Underneath the celluloid, on one side of the handle is placed the name and residence of the subscriber, and on the other side pictures of a Queen, Drone, and Worker, as shown here.

The Material entering into this celebrated knife is of the very best quality; the blades are hand-forged out of the very finest English razor-steel, and we warrant every blade. The bolsters are made of German silver, and will never rust or corrode. The rivets are hardened German silver wire; the linings are plate brass; the back springs of Sheffield spring-steel, and the finish of the handle as described above. It will last a last-time, with proper usage.

Why Own the Novelty Knife? In case a good knife is lost, the chances are the owner will never recover it; but if the "Novelty" is lost, having name and address of owner, the finder will return it; otherwise to try to destroy the name and address, would destroy the knife. In traveling, and you meet with a serious accident, and are so fortunate as to have one of the "Novelties," your POCKET-KNIFE will serve as an identifier; and in case of death, your relatives will at once be notified of the accident.

How appropriate this knife is for a present! What more lasting memento could a mother give to a son, a wife to a husband, a sister to a brother, or a lady to a gentleman, the knife having the name of the recipient on one side?

The accompanying cut gives a faint idea, but cannot fully convey an exact representation of this beautiful knife, as the "Novelty" must be seen to be appreciated.

How to Get this Valuable Knife.—We send it postpaid for \$1.25, or give it as a Premium to the one sending us THREE NEW SUBSCRIBERS to the Bee Journal (with \$3.00). We will club the Novelty Knife and the Bee Journal for one year, both for \$1.50.

GEORGE W. YORK & CO.

St., Chicago, Ill.

Please allow about two weeks for your knife order to be filled.

No. 38.

* Editorial. *

Discouragements and Encouragements in Queen-Rearing. Never before was so much said and thought as now about improvement of stock, and as a consequence about queen-rearing. In probably the great majority of cases little or nothing is done to control in any way the actions of the bees in the rearing of queens, beyond the occasional introduction of a queen from elsewhere, with the hope of improvement.

Even those who are willing to do all in their power to make improvement are handicapped as in no other line of breeding, by the lack of control of the sire in mating. The man who attempts to breed a good horse or cow can do just as much toward controlling the sire as the dam, while the bee-keeper may take all the pains possible to select the dam and then have her meet a mate of the poorest sort from some colony two miles away. To be sure, he may succeed to a degree by having his young queens fly out to mate at a time of day when drones in general are not flying, or he may go to the expense of having a Davitte cage, but even then the control is only partial, for instead of a single drone being selected, a hundred or more will be on the scene of action.

But with all the discouragements there is much to encourage, and a man with the smallest allowance of ability and experience may do something, if not to improve his stock, at least to keep it from becoming worse. For, left entirely to itself, the greatest amount of increase coming from colonies most given to swarming and least given to storing, the chances are more in favor of deterioration than improvement. By purchasing a single queen of Italian blood, the owner of black bees may, inside of two months, have all his workers changed at least to half-bloods. No such rapid change can be made in any other kind of stock, so, in spite of discouragements, in this one respect the bee-keeper has the advantage over breeders of other stock.

While the discouraging fact is emphasized constantly that inferior drones within two miles or more may make trouble, the converse of this should not be forgotten. For if the inferior drones of a neighbor lower one's chances for improvement, it is also true that one's own superior drones will steadily be raising the grade of the neighbor's bees, so that as the years go by the damage from outside drones will be less and less.

Even if no attention be given to the drones, it can not be denied that a queen of superior stock mating with an inferior drone will give better results than would be attained if queen and drone were both of inferior stock.

Locality or Kind of Bees? Those who write for beginners in bee-culture need not expect that their writings will be scanned only by those without experience. Witness some of the following questions:

Some of the teachings of J. D. Gehring, when considered in the light of my own experience, are somewhat puzzling. An instance occurs on page 550. The first item given in the line of winter preparation is to look in the hives about the middle of October to ascertain the fact that the colony has a queen. I say sharply a few times, on the outside of the hive, wait five minutes for the bees to fill themselves, then take off cover, give a little smoke, and then proceed with the search for the queen. Now in my experience I should expect a rather long search after treating the bees in that way. In the first place, about the first thing I should do after rapping sharply a few times on the outside of the hive would be to take to my heels if I didn't want a lot of cross bees about my ears. Perhaps, however, Mr. Gehring smokes before he runs. He doesn't say. In any case, if I should rap on the hive enough to make the bees fill themselves, and then should give a little smoke, my bees would be ready to run like a flock of sheep, making the chance for finding a queen very poor. Now I want to ask, Is there a difference in bees that makes Mr. Gehring's bees hold still when mine would be sure to run?

Also, what is the object of finding the queen, seeing that it makes no difference in the treatment? for he doesn't say a word about doing anything different with a colony if the queen should not be found.

OLD EASTERNER.

There is a good deal of difference in bees in their deportment under the same kind of treatment. An amount of smoke or jarring that would have very little effect upon some bees would make others run so that the task of finding a queen would be difficult, if not impossible. The object of ascertaining the presence of a queen is no doubt so that a queen may be furnished where needed, or the queenless colony united with another. It is doubtful, however, that the practice of beekeepers in general would agree with that of Mr. Gehring. When looking for a queen it is of first importance that the bees should be smoked or disturbed in any way as little as possible. Once the bees get to running it is better to give up the search till another time. A single puff at the entrance, before opening the hive, and a very little smoke over the tops of the frames after the cover is removed, will be sufficient to keep the bees from flying out at the operator, and that is all that is required. Indeed with some bees no smoke

at all is necessary, and all jarring of the hive should be carefully avoided.

Probably few bee-keepers make a practice of looking through the hives for queens in the fall. If there is young brood in the hive the presence of the queen is known without seeing her. If no brood is present, which is likely to be the case, the queen will be small and very hard to find. Not finding her is by no means positive proof that there is no queen, so if no queen is found, and another queen is given, there is a fair chance that a queen is thereby wasted. On the whole, it is not likely that many would consider it advisable to make the search.

Getting Bees Off the Combs is rated by Editor Hutchinson as the most disagreeable part of producing extracted honey. He gives the practice of Mr. Miller, a Canadian, as follows:

Give the bees a good smoking, which drives down most of them, then get the super down near the entrance, when the rest of the bees will leave the super for the hive. When robbers are troublesome, use the escape. Mr. Hutchinson says he uses the same plan in removing surplus colony honey.

Mr. C. C. Miller uses somewhat the same plan. He writes:

"When a super of sections is to be removed from the hive, the plan of procedure depends upon whether robbers trouble or not. During the height of the season, and until the flow wanes, there is usually no trouble from robbers, and a super of sections may often be left exposed for an hour or more without any danger. Still, there is always a possible danger, and a close watch must be kept. After removing the cover I blow smoke lively upon, or rather down into, all parts of the super, taking half a minute or more, the time depending somewhat upon the amount of smoke the smoker is yielding at the time, and to an extent upon the bees themselves. When there has been anything like a stampede for the lower story, so that all the youngest bees have gone down, there is no need to smoke longer, and there is some danger of affecting the flavor of the honey by too much smoke. Then the super is taken off, and after the cover is replaced the super is set endwise upon it, well toward the front, with one edge of the super projecting over a little. After a time the bees will start a line of march from this projecting part down to the entrance of the hive, and not many bees will be left. It is possible that there would be an advantage in setting the super close down against the entrance, but when it is on the top of the hive it is easy to keep watch of it from any part of the apiary, so as to see the first attempt at robbing, whereas a land-office business might be going on unseen if a super stood on the ground.

"After the bees are mostly out of the supers, they are stacked up in a pile until the pile contains perhaps ten supers, a robber cloth escape being used to cover the pile from the time it is started. This escape is simply a robber cloth, having in its center a very

large cone escape of wire-cloth. It ought hardly to be called a cone escape, for instead of being a cone it is a pyramid, each side of the pyramid being an equilateral triangle, and each side of the triangle measuring 10 or 11 inches. This allows the light to shine freely on the top super, and the remaining bees make their way out without danger of robbers' entering. If robbers are troublesome, then the supers are taken immediately from the hive (a little more smoke being used than usual), and put directly on the pile under the escape. The robbers may be in thick clusters at the base of the escape, but they do not seem to know enough to enter at the top.

"Some one may ask why I do not use escapes on the hive, to which I reply that, like some others, I haven't time to wait for them."

Rather Serious Accusations against the editor of the American Bee Journal are contained in the following paragraph from the Rocky Mountain Bee Journal:

Under the head of "Contributed Articles" the American Bee Journal recently published Mr. W. L. Porter's paper on "Co-operation," which appeared originally in the June issue of the Rocky Mountain Bee Journal. The article was not credited to the R. M. B. J., and appeared as independent correspondence to the A. B. J. We have no objection to the republication of articles from the R. M. B. J., but we do insist most strenuously that proper credit be given. So far as we are aware the A. B. J. has never mentioned the existence of the R. M. B. J., and it would seem that to carry his policy of unfriendliness toward Western bee-journals to the extreme limit, Editor York deems it legitimate to take from their columns free-handed and without rendering credit. Whatever may be the motive, this is a species of piracy roundly condemned by all reputable journalists, and we are sorry to see it indulged by a member of the apicultural press. All we ask is, treat us fairly, Mr. York, or hands off, please.

We haven't read anything in a long time that has amused us so much as has the above. And yet we do truly feel sorry for our new brother editor. He didn't notice that right at the head of the article in question we had this credit:

"Read at the Longmont meeting of the Colorado State Bee-Keepers' Association, April 30, 1901, by W. L. Porter."

You see, we did not publish it "as original correspondence in the A. B. J.," as he charges. No other credit than what we gave was needed. Of course, our good brother editor didn't know that anything read at a convention is public property—even the report of discussions is, also, unless the journal publishing it has paid for such report, as we have done for that of the National Bee-Keepers' Association.

So it is clearly seen that Mr. Porter's article wasn't even written originally for the Rocky Mountain Bee Journal, but for the Colorado State convention. If it had been written expressly for that paper, why was it necessary to have at its head those words when appearing there also?

A paper read at the Longmont meeting of the Colorado State Bee-Keepers' Ass'n., Apr. 29, 1901.

Again, our worthy fellow editor says this:

So far as we are aware, the A. B. J. has never mentioned the existence of the R. M. B. J., etc."

Of course, again he wasn't "aware," for he evidently did not know of the following notice, which we printed on page 212 of this journal for April 4, 1901.

The Rocky Mountain Bee Journal is the name of the latest claimant to the patronage

of the bee-keeping public. It purports to be published for Colorado and the Great Inter-Mountain Region. It is to be issued monthly, is neatly printed, and presents a good general appearance."

Our first inclination, upon reading the accusations made by our fellow editor, was to ignore them entirely, as they deserved to be treated. And yet, after second thought, we felt it was an opportunity for us to enlighten him in a kindly manner, which we felt sure he would appreciate, for even editors' have much to learn, especially young ones.

Now, after having said that much, we will go further, and say that we wish the Rocky Mountain Bee Journal all kinds of success in the very difficult field in which it has chosen to enter.

But we would also like to suggest, that, sometimes it is better to write *privately* to a supposedly offending brother, and see if with his help a rather ridiculous side-show of one's self can not be avoided.

Weekly Budget.

W. Z. HUTCHINSON.

THE EXECUTIVE COMMITTEE of the National Bee-Keepers' Association for 1902, elected at Buffalo last week, are as follows:

President, W. Z. Hutchinson, of Michigan.
Vice-President, O. L. Hershiser, of New York.

Secretary—Dr. A. B. Mason, of Ohio.

THE ROOF-APARTY of August Asmusen, of Pottawattamie Co., Iowa, helps out our first page this week. Here is what he wrote us about himself and his bees:

EDITOR AMERICAN BEE JOURNAL: Ten years ago I started with one colony of bees, and finding it both pleasant and profitable, I have kept bees ever since.

I am a harness-maker by trade, and since last spring have lived on the main street next to my shop. In order to care for the bees properly I decided to keep them on the roof,

and I was forced to move them at night, as some of the citizens strongly objected to bee-keeping in town.

If it were not for the swarming habit of the bee, no one would have known the bees were on the roof. I have prevented the bees from swarming to a great extent, by giving them plenty of room, and controlling them by clipping the queens' wings.

The bees did well during the month of June, but on account of lack of rain during July they decreased instead of increased, judging by the hive on the scales.

August Asmusen.

Mr. WM. DUNCAN, of Dupage Co., Ill., began in the spring with 10 colonies, now has 15, and will likely harvest 100 pounds of comb honey per colony, spring count, in 4x5 sections. Mr. Duncan combines bee-keeping with the office of Justice of the Peace, and it seems to be a good arrangement.

We had the pleasure of visiting Mr. Duncan and his apiary, Aug. 29. He lives 17 miles southwest of Chicago, in a fairly good sweet clover district, so his honey is mainly from that source. He will have no difficulty in selling all he can take off the hives at \$3.50 per case of 20 sections. He now uses the Danzenbaker hive, but expects hereafter to use the regular Langstroth 10-frame brood-chamber with Danzenbaker super. Some other bee-keepers find such a combination all right for the production of comb honey. One great advantage is that in buying or selling bees, there is no difficulty about the brood-frames, as the Langstroth size is practically standard. And, then, some fear the Danzenbaker frame is too shallow for safe wintering of bees in a cold climate.

Mr. Duncan has a very neat apiary. But, then, if you knew the man you would expect that. He lives in a neat and pretty town. It is a peaceable town, too. He has not had a case on his court docket for months. Very likely one cause of this happy condition of affairs is "no saloon." The people in that beautiful Chicago suburb have better sense than to tolerate the presence of that pest-hole.

Mr. Duncan took us to see several other nearby apiaries, in one of which (the elder Mr. Schramm's) was a colony in a straw-skep—the first occupied skep that we had ever seen. Mr. S. said he got nothing but swarms from it, but this year he has not had even that from it, though it was a powerful colony. It is a novel and interesting sight.

About 3 p.m. Mr. D. ordered up a good horse and buggy, and took Mrs. Duncan along to visit Mr. G. W. Stephenson's apiary, about three miles away. We found Mr. S. at home with his nearly 80 colonies of bees. He also expects to harvest an average of 100 pounds of comb honey per colony, spring count, which was 80 colonies. Mr. Stephenson not only knows how to produce a good crop of honey every year, but all the sections are always uniformly filled. Perhaps one reason why he secures such good results is because he has strong colonies in 10-frame Langstroth hives, and only 24 bee-way sections in the regular 3x-section super, leaving a large open space at each side to be filled with bees. In this way the outside rows of sections are sometimes sealed over first, and all are as evenly filled as could be desired. To hold the sections in the super he has a 3x-inch follower board at each side of them, with wedges between the followers and the sides of the supers. He also wedges the sections up to one end of the super, so there is an open space at the opposite end also. Mr. Stephenson is well satisfied with this arrangement, as he well may be, for with its use he gets the results he wants.

Contributed Articles.

A Bee-Keeper's Vacation Spent in Wisconsin.

BY C. P. DADANT.

IT is a nice thing to take a vacation if one can find the time and opportunity, but one must feel that nothing left behind will suffer from his absence, and that the money the trip will cost would not be absolutely needed for some indispensable purpose. When you can reasonably combine these requirements, it is easy to figure, on the other hand, how much health and prolongation of life you can secure by a short absence from the daily routine.

My father is subject to hay-fever—a dreaded complaint with which probably a number of my readers are acquainted. This disease, it appears, is a sort of asthma or catarrh, caused mainly by the pollen of the ragweed. The hay-fever sufferers of the United States have formed an association, and have ascertained that their premises in this matter were right—that the disease is unknown where the ragweed does not grow, or grows in such small quantities as to be inoffensive. Sturgeon Bay is one of those privileged spots.

My readers, who are accustomed to observe the blossoming of all plants, since their pet pursuit depends upon the blossoms, have certainly noticed that in our middle States the ragweed grows in most abundant quantities in the stubbles, together with the knot-weed, and Spanish-needles, (which by the way, yield considerable honey), most of the growth of those weeds taking place after harvest. But in the vicinity of the Great Lakes, up in northern Wisconsin, the small grains—wheat, oats, rye and barley—grow so slowly, and ripen so late, that there is not time for any plant like these to grow, bloom, and ripen their seed, after harvest. So Sturgeon Bay is immune, and it is that point which my father has selected for his annual outing to avoid hay-fever. For 14 years he has regularly spent six or seven weeks there, in August and September, returning home by the end of the latter month.

If the reader will hunt up the map of Wisconsin, I will point to him the pretty spot of which I am about to speak. I do not enjoy reading of a place unless I can "place" it on the map, and I take it that others are like me in this respect.

If you have the map, start with your finger on Lake Michigan, from Chicago northward. You will soon come to the peninsula which forms Door County, Wis., and which separates the waters of Lake Michigan from those of Green Bay. About half way along this peninsula you will notice a narrow neck of land, with a little bay indenting the shore of Green Bay. This is Sturgeon Bay. At this point the neck of land is only 1½ miles in width and a deep canal has been cut in the land, joining the two lakes, so that the boats that go from Chicago to Green Bay, Oconto, Marinette, Menominee, and Escanaba, are no longer compelled to go up to the point and run down again, passing at the north end, through what is called "Death's Door," (an ugly name), but you run from Lake Michigan through the Sturgeon Bay canal into Green Bay, and vice versa, saving an extra trip of a hundred miles or so, and the peninsula has practically become an island.

The city of Sturgeon Bay, on the bay of the same name, is thus surrounded by water—Lake Michigan on one side and Green Bay on the other. The air is pure and cool, always refreshed by lake breezes coming from either side, and our Illinois, Iowa and Missouri friends must readily realize what a wonderful treat it is to get away from our parched, dusty plains and overheated fields, roasted by the August sun, and reach an oasis where everything is green and fresh, where mosses and ferns grow all over the forest and form a green carpet under your feet; where the water is cool, and the thermometer is considered high when it reaches 60 degrees in the shade.

Well, business was dull at home, the bees were idle, the small clover honey crop harvested, and our boys were willing to undertake to do all that had to be done, and take from our shoulders the home responsibilities. So wife and I accompanied "Grandpa" Dadant on his usual trip.

The city of Sturgeon Bay is not a fashionable resort. It is a plain, every-day looking little town of 3500 inhabi-

tants, with plenty of grit and lots of "go." The folks are not spoiled by rich tourists, and are willing to accept reasonable sums for entertaining the confiding visitor whose pockets are not overflowing with dollars. Fish is plenty, and the water is clear, yes, as clear as that of Lake Geneva, Switzerland; but we miss the snow-capped peaks that form the back-ground in that beautiful spot.

I found four bee-keepers, two of whom are subscribers of the American Bee Journal, and all seemed well pleased with their bees and the crops they harvest. One of them lives right in the city, and has an apiary of 59 colonies. He is employed as a skilled mechanic in one of the large sawmills of the town, but was unoccupied just at the time, as the mill had closed for a few days. We visited him one evening and found that he follows our plan of running the bees for extracted honey—with large hives.

"This is the only way in which I can keep bees and make it pay, and still continue at my work," said he. "I could not expect to run a large apiary and leave to my wife the care of harvesting the swarms, and following the bees in the harvest of a crop of comb honey, while, by using extracting supers, I can be away from home all day and feel sure that the swarms will be few, and that the bees are

"LOVER'S LEAP," ON GREEN BAY, WIS.

supplied with plenty of room; and it takes but a short time to harvest the crop, when the bees are through with honey-gathering. This is certainly the best method of bee-keeping for a man who is away from his home most of the time."

The honey resources seem to be very similar to ours. White clover is the main crop, but it seems to come later, as wheat does. When we were there, the crop was just over, and but little more honey was expected, and this only from fall bloom which is, they say, rather irregular. Yet there is an abundance of weeds, and the climate seems mild enough to keep moisture in the ground at all times, for the woods are full of ferns, mosses, and plants that can only live in moist ground. But it seems so queer to us Illinois farmers, to see the amount of labor involved in clearing a piece of ground. After the brush has been either grubbed off or burned off, the big stumps from the ancient pines have still to be extirpated, and, after that, the stones must be carried out. These are usually made into fences, as in New England, and when one of them is too large to be removed, others are piled up on top of it, and stone heaps like this loom up in every direction. Many Swedes and Norwegians have settled here, and have very neat farms, and the women work out-of-doors about as regularly as the men.

At the point of land formed by the junction of Green Bay with Sturgeon Bay, the United States government has established a light-house on the edge of a fine grove, and near to the finest fishing grounds in the country. This spot is called "Idlewild," and on the shore of Green Bay almost under the light-house is a projecting ledge of rock, called, "Lover's Leap." I do not know whether or not this name is connected with any Indian adventure. There are so many "Lover's Leaps" in the country that this may not have any very authentic legend, but it is a romantic spot. Together with a half dozen friends, we visited this spot and

went up into the light-house, the lady keeper treating us with the most exquisite politeness and kindness. We saw the fog-bell, which tolls every half minute during the fogs, to warn the passing boats. We ascended the tower and saw the big light, which is only a very ordinary lamp encased in a large globe of cut glass, some three feet in diameter, and with indentures in the glass intended to increase the power of the light, which can thus be seen over 20 miles, and throws alternately a white and red flash over the waters of the Bay. This light, with its clock apparatus which causes it to revolve slowly, we were told was made in Paris, and cost \$3000.

After roaming about over the woods, we suddenly found ourselves at a pretty summer resort hidden in the trees, and kept by a Mr. Haines, who proved to be another bee-keeper, and we had no sooner made ourselves known, than we were at home with him and had a splendid dinner served, and "clover honey," if you please, of the very best quality. I thought it quite worthy of notice that this man could keep bees successfully on this lonely spot, with three miles of bay on one side and 20 miles on the other. But the entire country around him being still wild, or nearly so, the wild blossoms must abound.

Well, shall I close with a "fish-story"? We went fishing a number of times, but, somehow, when we had the ladies along, we could not get much. For one thing, wife would not risk herself in a skiff, which she called a "little peanut shell," and we had to fish from a launch, and could not go anywhere and everywhere to the best fishing spots. Finally, a friend and myself managed to get away from our party one fine afternoon, got a row-boat and a boy to row it, and plenty of bait, and we started out on an independent expedition on the Bay. We stayed away some four hours, and had right good luck, and came back to the hotel with a splendid string of perch and pickerel—some 20 pounds. We felt very proud, and called the ladies to the hotel lobby so they might have a chance to admire them before we handed them over to the cook. "Oh what a fine lot," said my wife, "Where did you buy them?"

I will say no more about the fish of Sturgeon Bay, and the nice catches we made, for you also might ask me, "Where did you buy them?" Hancock Co., Ill.

Co-operative Effort Among Bee-Keepers.

BY W. T. STEPHENSON.

TRUSTS are the order of the day. Almost every line of industry, except farming and bee-keeping, is being trusted. Why not these?

Not long since some one writing on this subject gave the exact reason why farmers' organizations did not succeed—they haven't confidence enough in each other. They are afraid to risk their commodities in the hands of a representative, even though they would get a higher price. Let us, as bee-keepers, be careful lest we join their gregariousness in the respect spoken of by company.

So much for a prelude; now to the point.

I was greatly surprised when I read the article by Mr. G. M. Doolittle in a recent issue of the American Bee Journal. I was not so much surprised at the stand he took, as I was at the manner in which it was written. He says he is going to call a halt, and proceeds to accuse E. R. Root

the man who holds the highest and most responsible position among American bee-keepers of *misrepresentation*. So I am going to call a "halt," but among hypercritics, instead of in the ranks of the long-tongued advocates, as Mr. D. has done.

If Mr. Doolittle had been the fortunate possessor of that \$200 queen, it is more than likely that that article would not have appeared, as it would have been to his interest to keep mum.

We are led to think that Mr. Doolittle hasn't been reading the bee-papers very closely, or he would know that he was not the *first* one to call a "halt." The editor of the American Bee-keeper thinks it deceptive to value an extraordinary breeding-queen at \$50, \$100, or \$200, and to sell her daughters at \$10, \$15 and \$25. Remember, Mr. Hill, these daughters are *red clover* queens. For an illustration, suppose you had a quantity of very deep jars filled with apples; wouldn't you be willing to pay a fancy price for boys with arms of extra length, if all of the apples they could reach were yours?

He asks if any one knows of an instance where fine stock sold for twenty times the price of the very best, common stock. Not long since I read of a race-horse ("Flying Fox") selling for \$40,000. It was not because he could

implant his good qualities in his offspring, but because of his speed.

If I were a queen-breeder I would promptly send \$25 for a queen whose bees had a tongue-reach of 21.100 of an inch; nor would I be afraid of any one applying a \$10 "pressure" to the head of a bee from a \$15 queen to make the latter a \$25 queen.

I'm very glad that at least three of our bee-editors are friends. I wish they were all friendly enough not to "spat" so much. Unless a better feeling is cultivated, our co-operative efforts will never amount to a "row of pins."

Farmers' organizations go to pieces because they doubt each other. Bee-keepers' organizations would do better if they did not accuse each other of misrepresentation and deceptive practice.

After having said all of this, I know of no three gentlemen that I have more confidence in than E. R. Root, G. M. Doolittle, and H. E. Hill. Massac Co., Ill.

Introducing Queens—Side-Lights on a Criticism.

BY W. W. McNEAL.

WITH the permission of the editor I wish to consider the criticisms by Wm. M. Whitney (page 405) of my article on page 311.

I stated therein that, judging from her rule of action, the honey-bee could not be called a creature of love; that, instead, her ways were harsh and unyielding, and that she is never turned from her given course by that most beautiful qualification—love. It will be remembered that this was said in connection with a plan given for the introduction of queen-bees. I will say here that I am firm in the belief of the correctness of this deduction; for if the bees do have love for one another their love is of such form as to necessitate its being called by another name from that which makes men and women divine.

Mr. Whitney says he was very much "amused" at the fact of my arriving at this conclusion from a study of the habits of the honey-bees; and thinks that he could easily prove the bee to be prompted by the "highest type of love and patriotism," as known and experienced by mankind. I regret the evident lack of the proof of this in his argument; so of course he will excuse me for telling him that I have not been turned from the error(?) of my ways.

When Mr. Whitney compares the cold, heartless methods—the iron methods—of a colony of bees, with the principles of true love as revealed in Christ, or with the basic principles of truly christian government, he assumed a wonderful stretch of ability to make extremes meet.

Mr. Whitney was pleased to call particular attention to the fact that "Christian governments provide for the unfortunate and infirm;" and then says further, "but the time was when such persons were disposed of in the most convenient manner possible, as thought for the good of the majority,"—just as the bees do now.

If it be true that the honey-bee "knows from instinct" how to manage her affairs, then why need any one expect to see her decrees mingled with mercy for the needy and the afflicted, if their requirements run counter to those interests or conditions that give the greatest freedom "to perpetuate the existence of the colony?"

Back of the love of country is selfishness, pure and simple, for the bee well knows that she can not exist alone in the world. This is possible for her only in swarms, and best in large swarms; hence is her "devotion" and "patriotism" laid bare.

The real complexion of the honey-bee's nature must be admitted, accordingly, when we look squarely at the facts, and note that all her acts of kindness are directed to that end which tends to promote the greatest individual security through the strength of the colony; also, upon the other hand, that the honey-bee invariably follows the stolid routine of utter disregard of the sufferings of the worthy though afflicted members of the colony, is it not a logical conclusion that no ties of love or bonds of sympathy exist between or among them?

The fact that the "bee tenderly cares for her young" simply argues nothing to the point Mr. Whitney seeks to gain. If it were love and not avarice that prompts her to do this, then in time of famine she would not keep back the last mite from those young hopefuls—the larval bees; nor would she tear them from the cells and consume them! In more prosperous times we catch another view of the bee's "devotional" nature. The larval bee that is cared for so tenderly till it emerges from the cell is at once banished

into outer darkness, if some physical defect unfits it for duty—a queer kind of love, indeed!

In the fourth paragraph Mr. Whitney virtually denies the correctness of his position by saying that the honey-bee is "governed by a law in Nature that means simply the 'survival of the fittest.'" Now what does the survival of the fittest mean in Nature but that the strong shall oppress the weak? This is exactly what I said was the rule of action with the honey-bee—that it's impelling power was greed and not love.

Mr. Whitney's idea of love becomes "amusing" when he tells us to look to the bees for the "highest type of love and patriotism."

Does Mr. Whitney favor a return to those primeval customs for the betterment of social conditions? We will be "gracious" enough to suppose that he does not.

There is at least a shadow of inconsistency in the exceptions Mr. W. has taken to those statements of mine. Believing as he says he does, that the honey-bee is governed by the law of the "survival of the fittest," or, in plain language, the law of selfishness and might, wherein is Mr. Whitney justified in telling the readers of the American Bee Journal that said statements of mine were all fold-erol? Would it not stand to reason that since being guided by such a law the queen that is in the best physical condition, or when she is in her best condition to serve her colony, she would receive the kindest treatment from the bees of a stranger colony? Then, why should Mr. Whitney seek to ridicule my instructions for introducing a queen-bee by a method that is in perfect harmony with the law which he says governs the honey-bees? This he does not only with a laugh, but speaks of the plan as being an "experiment," and a "misfortune" to any who would dare to put it in practice.

Now the truth of the whole matter is, Mr. Whitney knows naught whereof he essays to speak. If he is disinclined to give any credence to the practicability of introducing a queen-bee by running her in at the entrance of the hive as quickly as possible after taking her from the combs of another colony, but wishes to pursue the old-fogy method of caging the queen, I feel sorry for him.

From my experience with, and knowledge of, the habits of bees, I feel like saying that the greatest folly bee-keepers in general are guilty of is the habit of caging the queen when wishing to introduce her into a stranger colony of bees. This caging of the queen takes from her the bloom which is her greatest safe-guard in the midst of stranger bees.

The method I here advise using is so free from fussiness that I can not see why any one should want to bother with a cage when introducing a queen-bee. All that is required to make it a success is, to take away the reigning queen and then thoroughly frighten the colony immediately and run the queen into the hive from the entrance. Never let the colony realize for a moment that it is queenless, but get the stranger queens into its hive before she, too, realizes what is being done. Smoking the colony while pounding upon the hive with some object is the most practical way of frightening the bees. This does not pervert the sense of smell so much as it diverts the attention of the bees till the queen has time to reach the combs. Then when the Misses Bees have wiped their mouths and turned about, Mrs. Bee is "at home" to them upon their own combs; and they don't care a tinker what she smells like.

I do not advise introducing laying-queens into colonies having capped queen-cells. The queen can be introduced all right, Mr. Whitney notwithstanding; but too often the young queens are allowed to hatch, and a laying queen has no chance in a fight with a virgin.

Let those who wish to try the method, use their more inferior queens first, till they become conversant with the regulations. It will require but a little time to determine how much smoke and how much pounding upon the hive is necessary to insure the queen's safety.

I believe that the readers of the American Bee Journal will not be long in learning the practical beauty of this quicker and better way of introducing a queen-bee.

Scioto Co., Ohio.

Please send us Names of Bee-Keepers who do not now get the American Bee Journal, and we will send them sample copies. Then you can very likely afterward get their subscriptions, for which work we offer valuable premiums in nearly every number of this journal. You can aid much by sending in the names and addresses when writing us on other matters.

Convention Proceedings.

From the Report of the Last Colorado Convention.

ABOUT BEES AND BREEDING.

Question.—Should we have good queens, and what constitutes a first-class queen? Drones should cut a large figure in a first-class apiary.

Mr. Gill—No other point is more neglected and is more profitable. I now have a strain of bees that has been carefully selected for 16 years. I don't care if they are not so prolific. I want them long-lived, with strong wing-power. I want them to live three months, and they will do it. The sources of success lie with the queen.

Mr. Harris—If a queen is weak in honey-production, the quicker you get rid of her the better. We do not dwell on this subject in our meetings as we should. I know, by my own experience, that one queen excels others. The trouble with many queen-breeders is that they do not pay enough attention to the drones.

Mr. Collins—We are all inclined to overlook some things in condemning a queen. Often, when some colony has produced a big crop, it is nearly out of honey. Some of my best colonies have honey in their outside combs, and no brood at any time.

Mr. Lytle—Have we a right to expect brood in the outside combs? The idea is to get a large force in each hive. I have gradually drifted into using Heddon hives, but in my Langstroth hives I usually get eight or nine frames of brood. I put the honey-combs on the outside of division-boards.

Mr. Dods—I have noticed that colonies that did not breed so much produced more honey. One colony, in particular, bred but little brood last season, but produced nine supers of honey. I think there is more in longevity than in numbers.

Mr. Harris—How does Mr. Gill know that some bees live three months in the working season? We can have queens that are both prolific and have long-lived progeny. We should take both into consideration.

Mr. Gill—I once got an imported queen from Mr. Heddon. I introduced her in a full colony, and thus had two strains of bees in the hive at once, which it was easy to tell apart. I have done so several times. It is easy to tell the old bees, with their black, shiny appearance and ragged wings. I have noticed many times that the colonies of long lived bees are the best honey-gatherers. Some colonies get to the lowest ebb in spring, 90 days before June, and yet come to the front.

Mr. Lytle—I am not quite convinced.

Mr. Gill—To one queenless colony I gave a frame of brood with a queen-cell on it. They tore it down and would not accept any others, and remained queenless all summer, longer than 90 days, and yet had bees left.

Mr. Lytle—That is not the point. Those bees were not in a normal condition.

Mr. Adams—Their longevity is largely accounted for by the fact that weakling colonies can not do much work.

Mr. Collins—You could settle that by making a swarm artificially, by removing all the brood and only leave the new queen to furnish brood.

Il. Rauefuss—How do you know that bees from other hives would not enter? The front row of colonies in an apiary is always the strongest and produces more honey than the other rows. In a heavy wind bees will alight at the wrong hive without knowing it.

Mr. Collins—In one of my yards the hives face every way. The bees would not go in the wrong hive there.

Il. Rauefuss—I set a hive with a pure Carniolan queen away off from the others, at one side, and still it showed some yellow bees. In testing queens I frequently notice this mixing. We also know that bees live long in queenless hives. I believe it wears them more to rear brood than to gather honey.

Mr. Gill—I used to cage queens in the basswood flow in Wisconsin, and have had queens caged from June to September, and made observations in that way. I agree that the front rows mark more strongly than the others.

Mr. Harris—We need to have pedigrees with our queens, and should make queen-breeders furnish them. It would make them more careful.

Mr. Deviny—A number doubt that any change can be made in the nature of insects and other animals. But it can be done. Look at the silkworm and the canary bird. The

silkworm can not now exist without the aid of man, and if the canary bird is turned loose in its native country it perishes. The potato bug was not a potato bug at all at first. It lived on a different plant here in Colorado. Then it traveled and took to potatoes, and now it is called the Colorado potato bug and no longer lives on its original food.

Mr. Lytle—I have one colony of pretty black stock. I know the queen was changed three times by swarming. Yet the colony now is as black as it ever was. I have thought that perhaps the queens of this colony mated with their own drones.

H. Rauehuss—I think that occurs very seldom. I once queened a yard of 40 colonies with queens from one queen, and used that queen to furnish drones. Those drones should have been pure. But not more than one out of twenty of those queens was purely mated, and there were but few colonies in the neighborhood, either, and they were not close by.

Pres. Aikin—To sum it up, select the best colonies, displaying vigor and other good qualities, and breed from them. The average apiarist can not do much to control the drones. I have practiced the method of unqueening for years with hundreds of colonies, on whole apiaries at once, so that it made no difference about the bees mixing. The colonies retained their normal strength 21 days, and then they went down, and it only took three or four weeks for them to be materially reduced.

Mr. Gill—That may apply to whole apiaries, and yet a few individual colonies may be longer lived than others.

Mr. Harris—I offer the following resolution:

Resolved, That the Colorado State Bee-Keepers' Association recommends to its members, in buying queens, to buy only of queen-breeders who furnish pedigreed queens, mated by pedigreed drones.

Mr. Honnett—I am opposed to that resolution, not on account of the good it may do, but I know of no such thing as a registry for pure-bred queens. It may be a good thing for experts, but it will put the common people into the hands of sharpers, who will advertise pedigreed queens, when there is no way to pedigree them.

Mr. Harris—You might change the phraseology and do good. All lines of stock are brought up to higher excellence in that way.

Mr. Lytle—No one here has spoken of the National Queen-Breeders' Association. Any competent and honest queen-breeder can furnish the information. No one can be a member of the National Queen-Breeders' Association and be dishonest. I believe the resolution is in the right direction. I think we can get a pedigree of drones. I second the motion to adopt the resolution.

F. Rauehuss—You can control fertilization. There are plenty of places here in Colorado where it can be controlled as surely as on an island. A man could go out a hundred miles on the prairie, and be absolutely sure that there were no other bees within reach but his own. Of course, he could not produce queens for a dollar a piece. He would have to feed.

Mr. Honnett—I am in favor of improving the breed. The question has been discussed by eminent breeders, and they agreed it was impossible to keep queens pure within a certain distance. But it won't be 30 days after you pass this resolution before you will see advertisements of pedigreed queens.

Mr. Largent—We don't all practice what we preach.

Pres. Aikin—The resolution does not bind. It only recommends.

The resolution was adopted.

THE RIGHTFUL SHARE IN BEE-KEEPING.

Question.—In working bees on shares, what shall the owner furnish, and what shall be the share of each—comb honey, extracted honey, and increase?

Mr. Harris—There is a great variation in the share one should have, owing to different conditions. The parties should fix that between themselves.

Mr. Foster—I have had a little experience in that line that was not altogether satisfactory. A year ago I gave 10 pounds apiece, or \$1 per colony for the season, to the owner. When the colony was above the average I gave \$1.50, or 15 pounds. But last year I shared half and half all through, expenses and profits, and when I figured up I found that I had paid the owner \$3 per colony, and it was now my turn to cry too much, for he did nothing but look on.

Mrs. Brock—I have always leased on halves, and received half the honey and half the bees. It is a question with me how the honey should be divided. Should the lessee take his share as he pleases, or should both parties be there?

Mr. Dodds—I have been leasing bees, and my custom is to stack the honey in a pile, and, if we do not sell together, give

the owner the choice of what he wants for his half, say every other case. I furnish my own hives for my increase and he his. If artificial swarms are made, and one of mine doesn't build up, I lose it; if one of his does not, he loses it.

Mr. Collins—I have offered the first 20 pounds from each colony, just such as comes.

Mr. Pattee—I have given half of the honey and half of the increase, the owners furnishing their own hives. We divide the honey.

Mr. Dodds—I think Mr. Collins' is the most desirable plan. There is another way, to have the owner furnish everything and own everything. Then there is no chance for the owner to say that increase has been made with discrimination. The apiarist does the work and gets half the honey. He simply puts his work against the capital.

Mr. Pattee—I cleared eight colonies and \$110 off of 17 colonies, spring count. I took 2500 pounds of honey.

F. Rauehuss—Now, let us hear a few bad reports.

Mr. Honnett—I started with 110 colonies, spring count, and had a return of 110 cases of honey.

Mr. Brock—In my early experience I bought 40 colonies of a man who was to turn them on shares. They increased to 66. Next spring I had three left and was \$8500 out.

Mr. Honnett—I endorse that plan of the owner furnishing everything. Then there is no clashing about swarms. The hives offset the swarms and fixtures. It is very equitable.

F. Rauehuss—The most satisfactory way is for both parties to rent on a cash basis. Say there are 100 colonies. I pay \$1 a year apiece, cash rental, and have an impartial person examine them on the first of October, to see that I return bees, supers, hives and fixtures in exactly the same shape that I found them. The lessee ought to be expected to furnish a bond or security. Of course, common law will protect the owner if damage is done. By this plan all increase goes to the lessee.

Mr. Harris—In 1898 I put into winter quarters 85 colonies. The next spring I had 35 colonies, and got 800 pounds of surplus honey.

Mr. Collins—By my plan, if there is not much honey, you are not out, and there are no bees to divide. I would not follow Mr. Rauehuss' plan for one year alone, if there is foul brood in the neighborhood, for it might appear in the apiary the next year, and I be held liable for introducing it.

F. Rauehuss—Circumstances alter cases.

Mr. Honnett—In my locality I catch at least as many swarms from outside as come from my bees, and there would be a chance for a clash there.

Mr. Collins—I would have that covered by the agreement.

FAULTS THAT JUSTIFY REQUEENING.

Mr. Martin—A colony with a drone-laying queen should be requeened, providing it is populous. Otherwise, it should be united with another. If a queen is lost during the flow, or when the colony is populous, the colony should be requeened. I often requeen a colony soon after it has swarmed (if I find one that has swarmed without my knowing it) and cut out the cells at the same time. When I find a colony with an unproductive queen, I sometimes kill her. I also requeen colonies that show inferior traits in capping or finishing honey, or in some way are not good workers.

Mr. Collins—Do you not replace the old queens on account of age?

Mr. Martin—Not if they are prolific. Sometimes it is not the fault of the queen if the colony is weak. It is hard to lay down a rule. Then sometimes a colony with a laying worker does not wish to accept a queen. In such a case, I advise doubling up or stocking up with bees. One can follow no general rule. This year I had two colonies whose honey was capped quite differently from that of the others. The combs were of a "washboard" shape, and did not fill the sections. In one hive I had three supers of that honey all capped, but it was all second grade. Such colonies I would advise requeening.

Mr. Kruger—Last May I found a colony with a drone-laying queen. It swarmed in June, and I gave one of the cells to the swarm and left two with the old colony. The swarm did well, but a queen hatched in the old colony that never laid.

Mr. Sylvester—Queens are sometimes imperfect.

Mr. Harris—When I find laying workers, I move the hive some distance and put another colony in its place. Then I shake out the bees in front of the hive and introduce a queen, which is accepted.

Mr. Collins—I had a colony of laying workers that refused to accept queen-cells. Then I took a band-saw and slashed the brood all up, after which they accepted a cell.

Mr. Dudley—I used to move such a colony about 100 feet

away and then shake off the bees. I think a better way is to put the hive on top of another colony which is not strong enough for the super. In a few days the bees will kill off the laying workers. You can then return the hive to its stand and introduce a queen.

H. Rauefuss—That plan is a good one, but one thing was omitted. A sheet of paper with a hole in it should be placed between the two hives, to keep them from fighting. Then the two hives might be left together. Some will say that makes one less colony. But if you want increase, you can raise up some brood into it from below, move it, and introduce a queen.

Mr. Dudley—I forgot to say that I use the paper in uniting. As to having one less colony, I consider that as soon as laying workers are found, that is a lost colony.

Mr. Lytle—It is wise to supersede every queen that will not give as much profit as the average. It is not wise to supersede any queen that has given good satisfaction. Two queens that I received by mail I introduced with tobacco smoke. The way to do is to smoke thoroughly until every bee in the hive has been reached, then open the hive and let them run in. The theory is that the inside bees are stupefied, including the old queen, while the new queen is vigorous, and hence overcomes her rival when they meet. In one instance I found the old queen lying outside of the entrance a few minutes after the new one was introduced.

Mr. Rauefuss—Is there not danger of robbing when this is done outside of the flow?

Mr. Lytle—There is, and in three cases in which I did so after the flow, I reduced the entrance to a one-bee space.

Mr. Harris—I tried introducing six queens with tobacco smoke, and lost five. I used tobacco stems, and gave it to the bees vigorously, and let the queens run in. Two or three days afterwards they were not there.

Mr. Kruger—I use a cloth dipped in peppermint and water, and laid over the frames. I have never lost one queen.

Mr. Rhodes—Has any one tried smoking with cloths soaked in salt-peter water, and dried?

H. Rauefuss—Yes, that practice is common in Germany, and has long been known. It stupefies the bees so they drop off the combs. There is another use of those salt-peter rags that I will call attention to, though it is not connected with the subject. They are just the thing to light a smoker with, since they do not go out after being once lighted. A small piece is sufficient to start a fire.

VALUE OF FREQUENT COMMUNICATION BETWEEN BEE-KEEPERS.

Mr. Foster—I find that I secure my best points in bee-keeping by button-holing my bee-keeping acquaintances. It also is of value in one's own neighborhood, especially when foul brood is about. In this way I discovered and got rid of a bad case that otherwise would have been a menace to my bees. Free communication with reference to foul brood has such a value that it almost pays one to carry it on as missionary work.

Mr. Martin—I moved 100 or more colonies into a new locality, where I had no time to look around. I noticed they were gathering honey very early, investigated, and found a neighbor's colony being robbed that had foul brood. In another case I found a hive set out in which bees had died from foul brood, and bees working on it, though mine had not yet found it. I have had several such experiences, and have, therefore, made it a point to have frequent communication with my neighbors, whether it is very welcome or not.

Mr. Collins—I found a foul-broody colony once in a school-house, where the bees had been for five years.

Mr. Honnett then gave two instances, mentioning the names of foul brood being moved into his neighborhood in former years, and added:

Mr. Honnett—This convention also proves the value of free communication, for many of us have ideas that we are not able to express until they are brought out by discussion.

Mr. Foster—A friend of mine, who is slow to accept new ideas, came to me once and said he had lost 10 or 50 swarms by absconding. On investigating I found that he had lived his swarms in hives with little ventilation, and set most of them in the hot sun without shade-boards. Those set in the shade stayed. I gave him the needed instruction, which communication was probably of value to him in the future. Annual Report of the Colorado Board of Horticulture, 1901.

Queenie Jeanette is the title of a pretty song in sheet music size, written by J. C. Wallenmeyer, a musical bee-keeper. The regular price is 40 cents, but to close out the copies we have left, we will mail them at 20 cents each, as long as they last.

* The Afterthought. *

The "Old Reliable" seen through New and Unreliable Glasses.
By E. E. HASTY, Sta. B Rural, Toledo, O.

THE GOLDEN BEES.

It's a very singular state of things, to say the very least, which Mr. Doolittle narrates on page 501. A leading breeder of golden bees, he has never, he claims, pushed them in any way, and never even advertised them! One can hardly avoid saying that if they are desirable bees better say so—"in season and out of season," as the phrase runs—in advertisements and out of the same. On the other hand, if they are undesirable bees, sphynx-like silence while selling them by hundreds looks too much like the spider-and fly sort of ethics.

EXTRACTING IN HOT WEATHER.

When it gets to 110 degrees in the shade you must not extract unless combs are wired in for keeps. Arizona contributes this slice of wisdom; and we can believe it very easily. Most of us would prefer the hammock to the extractor at those figures. Page 507.

RELATION BETWEEN SWARMING AND HONEY-FLOW.

I take considerable interest in the experience of Wm. W. Case, page 507, that a heavy run of honey coming on suddenly stops swarming. At my yard this year swarming was violent, and stopped very suddenly; but my mind did not connect this with any change in the honey-flow. Perhaps if I had watched the honey-flow more minutely some relation between flow and swarming would have appeared.

A NEW BEE-SOCIETY SUGGESTED.

Mr. Beech, we shall need a society for preventing cruelty to bees if you do not extemporize some sort of shade when the thermometer goes up to 108 degrees. The "Light Brigade" were hardly more worthy of fame than those bees that hung out during the cooler portions of the torrid days, and marched "into the gates of hell," when it got its hottest, to save their brood by watering and fanning—if that's the way they did it. Page 508.

HYIVING SWARMS WITH WEAK COLONIES.

As to living in swarms with weak colonies, I am still undecided as to whether it is worth while or not. Trends towards having "all colonies strong;" but don't believe I'd practice it very much if I was sure of an abundant supply of hives ahead. Saving the queen of the weak colony, and giving her immediately to the colony that gave the swarm, is a kink which will bear thinking of. If she was to blame for her colony's being weak, the other colony would better rear their own. In the much more common cases of bad food or bad keeper, it looks good practice, provided experience does not find it originating a second series of swarms. Page 507.

SPLINTS VS. WIRE FOR FOUNDATION.

Splints standing in saw-kerfs at top and bottom, eh? Little by little a method gets the additional touches it needs to make it complete. Who knows but what wire for staying foundation will eventually take a back seat and splints see the play from the front row? Page 509.

PAPER SACKS FOR HOLDING HONEY.

I doubt if Mr. Davenport's tombstone will say anything about his adopting the paper sack to the carriage of honey. The little packages "will come to grief" at the hands of the hired girl, and the big ones at the hands of the freight handler, methinks. If everybody read and obeyed directions it might be different. Page 517.

RENDERING WAX WITH BRINY WATER.

For rendering wax the inside fitting stove of Adrial Getaz, to boil the wax up into, looks a good thing. And to increase fire food the rising force of wax is quite a brilliant thought. Good boy, but! Even a good boy sometimes has to be sent back to his seat to finish a problem. Will brine take hold of dirty refuse and break it up as well as soft water? The two are quite different fluids, chemically. Possible that brine may be the better of the two, but the probability looks strongly the other way. Perhaps the salt must be added after the soft water has done its work. Boiling brine

might be poured in after the dirty soft water has been drawn off through a faucet. But then, perhaps the advantage of this method over other methods was its simplicity; and when we have put all the improvements on it, will not the simplicity be gone? Wires have a high specific gravity, consequently a strong gravitative attraction, much more than threads. I suspect this originates some of the difficulty in getting the wax to rise. A sieve bottomed with cheese-cloth instead of wires might be tried. Page 516.

HONEY FROM MULBERRY FRUIT (?).

If Dr. Peiro has honey that was stored from white mulberry fruit, and it is good, he has done experimental apiculture a proper good turn. But I hope he will pardon the grain of salt slowly melting on our tongues. If we knew he fed a colony at least five pounds in 48 hours—if we knew said colony didn't get over a pound of nectar meantime—if we know "the man on the fence" found a marked difference in flavor between the honey and the honey in the next hive—I am not asking him these questions, I am only ruminating them. On the whole, I think I have more faith in that currant-mulberry jam. Page 524.

Questions and Answers.

CONDUCTED BY

DR. C. C. MILLER, Mergo, Ill.

(The Questions may be mailed to the Bee Journal office, or to Dr. Miller direct, when he will answer them here. Please do not ask the Doctor to send answers by mail.—EDITOR.)

Felt Roofing For Doubled-Walled Hives.

Has any one had experience with felt-roofing? If so, what satisfaction does it give? I want to build some double-walled hives, and try it. Also state whether two or three ply is required. MICHIGAN.

ANSWER.—I know nothing about the matter from experience, but should expect good results. Can any one tell us anything about it from actual practice?

Keeping Bees on Shares.

I have 16 colonies of bees in 11 dovetail hives. I have winter-cases for 25 colonies, foundation-fastener, bees-escapes, and some other appliances. The colonies are all strong and healthy, as they were examined by J. M. Rankin, July 21. I expect to let the bees on shares to a neighbor, he having the whole care and all the sales to make. What share should each one have? MICHIGAN.

ANSWER.—Your conundrum is a tough one. So much depends upon the knowledge and skill of the man who has the bees in charge that about the only thing to do is to shut one's eyes and make a guess. Taking into account what you say of your neighbor in a private note, I should guess that you should be satisfied if he turns over to you one-third the amount of his sales. But mind you, I don't guarantee my guess; neither do I agree to replace it with a new one in case this should not give satisfaction.

Perhaps No Disease at All.

I send a small piece of brood-comb for your examination. Can you tell me what it is? It does not seem to have the symptoms of foul brood, nor pickled brood, as I think they both attack and kill the larvae, and you see the bees are perfect and nearly ready to hatch. I might think it a case of chilled brood, but I had a colony similarly afflicted July 10, and I would not think brood could be chilled at that time. I have two colonies afflicted with it now, and both have been, and are now, weak, but the first colony, affected in July, was very strong. I treated it *ala* McEvoy for foul brood, and it is all right now. I shall treat these in like manner, but I would like your opinion as to what the trouble is. The bees do not seem to carry out the dead brood, and the queens are laying only in one comb. Is it a new disease? NORTHERN ILLINOIS.

ANSWER.—You give no description of the trouble, and the only thing to judge from is the sample of brood sent.

Giving a hasty glance, I should say there was no trouble whatever; the smell is sweet and good, and healthy bees are now emerging, two days after mailing. A closer examination shows nothing wrong with the sealed brood, but something wrong with the few specimens of unsealed brood, they being well advanced toward maturity. If you had made no mention of any trouble, I should still have said there was none. The young brood has no diseased look, but the appearance of having been partly torn out by the bees, as in a case of starvation or chilling. It would hardly seem likely that there would be chilling or starvation, yet until you say there was no possibility of such a thing my guess would lean that way.

* The Home Circle. *

Conducted by Prof. A. J. Cook, Claremont, Calif.

SYMPATHY IN SPORT.

"The Home Circle," page 569, urged recreation. Let us all sympathize fully and truly with our children in their varied sports. I visited my son two years ago. Though 24 years of age, he was a member of a base-ball club, which played match games quite frequently. He was the man behind the bat, and his side usually won, and he was a prominent factor in the success. I rejoiced that he wrenched himself from his regular duties for this neighborhood outing. First, it rested and recreated him. It did the same to many others. It gave the whole community a rest-day of pure, unobjectionable pleasure. It robbed other attractions, not so wholesome, of their power to lure and demoralize.

The next day I found the players in the Sunday-school, and rejoiced that my son showed the same enthusiasm in teaching a large class of young people as he exhibited on the ball-ground, the day before.

I thank God for all wholesome sport.

THE STRIKE.

Among the many beautiful, wholesome, and inestimable fruits or uses of our American homes is that of making sentiment. In our prayer-meeting last night we discussed reverence, its use, and how it might be cultivated. A home with the spirit of reverence ever gilding its precious environs—reverence for God, for the Christ spirit, for truth, honesty, and purity, will be one of the most gracious seed-beds of genuine reverence for all that is holy and good. It should be the happy privilege of all our home circles to foster and strengthen every good sentiment.

How excellent and frequent are the opportunities to do this most beneficent work. My father had the reverent habit. I am sure his life helped all of us children in this good way. He hated tobacco, and the saloon. I never put tobacco into my mouth, and I always feel like crossing the street to avoid the saloon, which my father taught me was a very pitfall of wickedness and lust. With my father's example, I could never have used profanity, and vulgar language, and slang has ever been distasteful. My own experience vivifies and glorifies in my mind and thought the power of the good home to make sentiment.

Is it not unwise for us to magnify in our thought this phase of home influence and blessedness? Is it not wise to discuss great questions as the times bring them before us, that we, and all in the home circle, may gain and carry with us from the home correct views of life, its duties, and functions?

To-day the strike is the great theme in everybody's mouth. It comes from the widespread unrest, and the far-reaching grievances among the laboring classes. Mr. Chauncey Depew said, years ago—and he is in position to know—that the laboring men have a grievance. I believe he was right. That grievance does not down with the years; nor will it cease to raise its threatening visage till the laboring classes are as able to assert and maintain their rights as are those who employ them. I assert a truism, when I say that for honesty of purpose, real, genuine integrity, unswerving patriotism, and unselfish desire to promote the good of all, the laboring people, as a whole, are now, and will ever be, greatly superior to the people of wealth—the employers of labor. Abundant means to gratify every wish, with no let or hindrance; possessions not won by one's own efforts; ability to overreach

and hold down the one who may seem to oppose—all tend to breed selfishness.

The poor man—the average laboring man—early learns self-denial. He is not pampered, and becomes thoughtful and kindly towards others. He is trended by very circumstance in the way of unselfishness. The rich person in the cradle has equal potency to a worthy, unselfish life that the poor man has. Condition of life is what swerves him to the wrong and unfeeling. Hence the words of Shakespeare, "I'd rather be a dog and bay the moon than such a man." And Christ's "how hardly shall a rich man enter the kingdom of heaven;" and James' "Go to, ye rich men; weep and howl for the miseries that shall come upon you."

Are riches, then, worthy the coveting? Are we wise to bend all to their getting? The comfortably well off poor man is in best hope of character development. With a nation of such we are safe. We may all hope and pray that our people may all be in comfort. We may well work and legislate that few gain extravagant wealth. The laborer gains his ends by worthy effort that *always* adds to the world's wealth and blessing. He also has the dignity of position that comes from independent maintenance. The very rich, with few exceptions, either have had their wealth poured into their laps, or else have gained it through questionable methods, and without giving value received. In either case they are not to be envied, and have not the best citizenship.

That the poor man labors under the burden of a fearful handicap, is shown in the report from one of the iron-mill towns, where the taxes of the mill property were fixed at less than 1/4 what the laborer had to pay on his property. True, this was granted by the town. But the company was able to pay more than any other, and able, also, and willing—to their shame be it said—to secure this unfair and wickedly inequitable reduction. Can these unfair advantages which, now are as thick as pebbles on the beach, ever be stopped? They can and will be. I hope—soon. The power to do this will only come through complete co-operation: when the laborers, through the wise management of their truest, ablest, best men, shall have equal voice and influence with the men of capital who employ them. The laborers are so many, and so scattered, and often so ignorant, and so blind to their own best interests, that it will take long to bring this blessed consummation. Complete union with education to make it safe, and its bestests right and wise, is what the country and the laborers most need. I believe it was to promote such union that this strike was ordered. If it helps even a little to bring it, it will be worth all it costs. If it was ill advised, and does not hasten the day of fullest co-operation, then it is greatly to be regretted.

I long to have the "other half" in such complete union and accord that they will act as one man. Then they can hold up their heads, and can dictate equally with the rich employers. Then, and not till then, will the laborers cease to have a grievance. Any discontent that hastens education and fosters union is holy, and should receive our sympathy. A

strike that hastens on complete union—at least complete enough so that the laborer may have equal voice and influence in the settlement of all disputed questions—is to be desired, if there is no other way, even though it bequeathes a legacy of business disasters and commercial interference that may touch our industries grievously, and far and wide.

It is to be regretted that arbitration rather than strikes can not be used to hasten effective union. The men who inaugurated the strike expected that their action would hasten and strengthen more complete co-operation. If they were correct in this judgment, then they acted wisely, even though the great public is wholly against them. If they judged wrongly, and so delay the day of fullest union and oneness, then their action is greatly to be regretted. The injuries to others, and general suffering, are most unfortunate, but our greatest reforms often mount upward on the stairway of pain and suffering.

Let us all in our homes strive to beget in our children right views and feelings regarding all these great issues.

THE ARMY CANTEN—PROHIBITION.

I am glad our old friend, A. I. Root, sounds forth such wholesome views regarding the canteen. While I have always voted with the Republican party, and am not ready yet to sever my connection, I have great sympathy with prohibition. If I thought voting prohibition would hasten it, I should not hesitate a moment. The prohibition of the liquor-traffic is the greatest issue before our people. The saloon men always fight the canteen in the army, prohibitory laws, local option, every effort to stay the liquor-traffic. If the canteen were favorable to temperance, why would the saloon interests be solid against it?

I hope the law against the canteen will hold its gripe in our statute books.

[We would like to suggest to Prof. Cook that it is not a question whether voting prohibition will bring prohibition: it is rather how a conscientious Christian man can continue to vote with saloon-keepers, brewers, etc., and still retain a clear Christian conscience, and also see any hope of staying the saloon evil.

A bigger question just now than the saloon question is this: Are the Christian voters of this country going to do *their duty*—live right up to their church resolutions on the great subject of prohibition, or, are they going to continue to stand before the world as inconsistent people, talking one thing and doing another?

Personally, we are consistently and eternally against the saloon, and intend to continue to use the heaviest possible weapon for its overthrow, namely our vote. If we don't have to win in this fight, but we do have to do the right, and our consistent duty.—Enron].

100 Colonies of Leather-Colored Italian Bees For Sale....

From stock which took first premium at the Minnesota State Fair, 1901. All in standard hives, in fine condition, and with abundance of sealed stores for winter.

Much Interested in Her Bees.

A queen I sent for came safely to hand last Friday forenoon. I introduced her in the afternoon. To-day I looked into the hive and found her laying nicely. She is a fine looking queen, and I am much pleased with her. I feed them a little syrup every night. I think the colony had been queenless some time. I had been away from home a couple of weeks and found them queenless upon my return. I hope to do well with her another year. This is my second summer with bees, and I become more and more interested in them.

Mrs. W. J. HILLMAN.

Richland Co., Wis., Aug. 30.

Best Honey Crop in Two Years.

The honey crop in Kankakee county can be raised good this year, the first good crop in two years. The quality of the honey is fine—mostly from sweet clover, white clover, and basswood; but as to the latter two items, we would have but little surplus if we depended

QUEENS

on them. Sweet clover is our great staple for surplus honey. It grows in great abundance here along the roadways, railroad rights of way, and around our stone quarries.

From reports, I believe the average honey crop will be 50 pounds per colony. One bee-man reports an average of 100 pounds from 35 colonies. Also another has two colonies that have produced 150 and 175 pounds each, respectively.

Let the honey-producers plant the white and yellow sweet clover in their vicinity, and they will have to do no fall feeding to winter their bees. We average one super of honey from heartsease in the fall. "KANKAKEE"

Kankakee Co., Ill., Aug. 28.

Bees Working on Buckwheat.

My bees are rolling in the honey now from buckwheat. I got more clover honey this season than ever. Almost all colonies that didn't swarm filled two supers, and most that swarmed filled one, and I will get two more from the most of them yet, if nothing happens to the buckwheat. My bees started the second swarming fever this week. I have been returning the swarms. G. W. BELL.

Clearfield Co., Pa., Aug. 23.

An Experience in Transferring.

EDITOR YORK:—I recently wrote to know if you could supply me with some back numbers of the American Bee Journal, and you kindly sent me a few. Since becoming a subscriber I find them useful, and every bee-keeper should have one of the Emerson binders to keep from misplacing them as I did.

For instance, to show their usefulness, I wanted to unite, and at the same time transfer two weak colonies from boxes or "gangs" to movable-frame hives, and I readily found advice by looking over some of the back numbers, and went to work. It being my first job, I began about as timidly as a young surgeon would when amputating his first limb from a human being. However, I made a complete success, which I will tell for the benefit of beginners like myself.

I first moved one of the box-hives close beside the other to be united, several days beforehand, for them to get acquainted with all the surroundings before transferring them. When the proper time arrived I went to work as follows:

First, I prepared a table by placing a wide board over a flour-barrel and folding a crocus sack several times over the table, and on top of that I spread a paper. Of course I had provided myself with all the necessary tools, etc., a honey-knife, narrow chisel, and the clamps—made by tying two narrow strips of thin wood together at one end, and leaving the other two open to be tied after placing them around the comb.

Next, I moved both hives back about two feet and placed a movable-frame hive about half way between the location of the two box-hives.

I next opened one of the hives and took out a comb and fastened it in the frame of the new hive, then cut the brood-frames first, and then cut the combs to fit into the frames the best I could; and then the wire on the underside holding the combs till I could fasten the clamps.

In wiring my frames I placed the wire to one edge of the frame instead of placing it in the center. This gives room for the comb to rest well in the frame, which I find much better than to have it in the center.

I took pains to put the brood in the center of the hive. I first used up all the comb of one box-hive, and then brushed the bees in front of the new hive, and they soon ran in. I then opened the other box-hive and went through the same process, by using up first the best and fullest combs. Remember, I brushed the bees off of the combs back into the old hive until I completed the first box-hive, and after beginning on the second hive I brushed the bees off of the combs into the new hive, and by the time I used the last comb of the second hive I had nearly all the bees in the

Extracted Honey For Sale

ALL IN 60-POUND TIN CANS.

Alfalfa Honey

This is the famous White Extracted Honey gathered in the great Alfalfa regions of the Central West. It is a splendid honey, and nearly everybody who cares to eat honey at all can't get enough of the Alfalfa extracted.

Basswood Honey

This is the well-known light-colored honey gathered from the rich, nectar-laden basswood blossoms. It has a stronger flavor than Alfalfa, and is preferred by those who like a distinct flavor in their honey.

Prices of Alfalfa or Basswood Honey:

A sample of either, by mail, 10 cents, to pay for package and postage. By freight—two 60-pound cans of Alfalfa, 8 cents per pound; four or more cans, 7 1/2 cents per pound. Basswood Honey, 1/2 cent more per pound than Alfalfa prices. Cash must accompany each order. You can order half of each kind of honey, if you so desire. The cans are boxed. This is all.

ABSOLUTELY PURE HONEY

The finest of their kinds produced in this country.

Read Dr. Miller's Testimony on Alfalfa Honey:

I've just sampled the honey you sent, and it's prime. Thank you. I feel that I'm something of a heretic, to sell several thousand pounds of honey of my own production and then buy honey of you for my own use. But however loyal one ought to be to the honey of his own region, there's no denying the fact that for use in any kind of hot drink, where one prefers the more wholesome honey to sugar, the very excellent quality of alfalfa honey I have received from you is better suited than the honeys of more marked flavor, according to my taste.

McHenry Co., Ill.

C. C. MILLER.

Order the Above Honey and then Sell It.

We would suggest that those bee-keepers who did not produce enough honey for their home demand this year, just order some of the above, and sell it. And others, who want to earn some money, can get this honey and work up a demand for it almost anywhere.

GEORGE W. YORK & CO., 144 & 146 Erie St., Chicago, Ill.

new hive; but what were left, after taking out all the combs, I brushed off in front of the new hive.

I paid no attention to the queens, as each box-hive colony had a laying queen. I left that to the bees to regulate.

By uniting the two colonies I had a hive running over with bees, and more comb than the brood-chamber of the new hive would hold, so I got a super and filled it with the remaining comb. There were no supers to either of the box-hives, and each had eight combs fastened to eight slats laid like frames in the box-hives, but were without bottoms or end-plates—merely the top of a frame.

Of course I found considerable crooked comb, and had to fasten some pieces of comb in the frames of the new hive. This is a mighty sticky, messy job. If one is not patient and capable of using good judgment he is very apt to make an ugly job of it.

I will say for the benefit of others who may have had less experience than myself, that the best time of all to transfer bees into a new hive is the first of the swarming season, when the combs are light and mostly empty. But I am so much opposed to little, weak colonies that I was willing to double them up, even at a risk of failure, in order to fix them better for winter. However, my beesmen are opposed to uniting weak colonies on the ground that after being united they may soon become as one weak colony at last, unless the queen keeps up the numbers, which she is not likely to do, and in the end you will have only one ordinary colony, where you had two that might have built up to be ordinary colonies.

I find that my two colonies united peacefully, without smoking them, and have gone nicely to work as one powerful colony.

JOHN KENNEY.

Adams Co., Miss., Aug. 8.

Report for the Season of 1901.

I put into winter 73 colonies, and last spring I had about 50 good, but, and indifferent. It was the worst spring on bees of any in my experience, which dates back to 1892.

From 50 colonies, or thereabouts, I secured about 2000 pounds of honey, nearly all comb, and increased to 61 colonies. Less than 20 percent of my comb-hive colonies swarmed, though this was a great year for swarms for most bee-keepers here.

The prospects are that bees will go into winter in good condition, though the prospects for next year are very poor, on account of the drouth which still continues.

E. S. MILES.

Crawford Co., Iowa, Aug. 22.

Mulberry Growing.

Will Dr. Peiro give answers to the following questions in the American Bee Journal?

1. How large do mulberry trees become as to height and spread?
2. How long from available or expressible sapling to fruiting?
3. Is the white variety better than the black? Is there a difference in handling?
4. Is "Russian" mulberry the right name? I can find other names of white varieties, but no "Russian."
5. Is any kind better adapted to dry places than others?
6. Is it liable to attacks of any pests?
7. Do bees work on the blossoms?
8. Cyclopedia says it is closely related to figs. Has it similarly enclosed numerous seeds, the "fruit" being the fleshy receptacle?

Monterey Co., Calif. A. NORTON.

Dr. Peiro has kindly replied to Mr. Norton's questions as follows:

1. Black mulberry trees grow to 20 inches in diameter, while the white variety does not attain so large dimensions, to my knowledge. Both spread broadly.
2. They bear fruit in about six years from 6 foot trees (expressible), inch diameter.
3. The white variety is best at honey-producing, being much sweeter than the black. I believe both varieties to be equally hardy.
4. "Russian" is the usually accepted name for the white. It may only be derived from

its capacity to withstand extreme cold without material injury.

5. I believe the various kinds are equally hardy in dry localities.

6. I know of no insects that seriously infect the mulberry. It is clean and apparently free from diseases.

7. I do not know that bees work on its minute blossoms. I would not depend upon its possibilities.

8. Yes, the mulberry is not remotely allied to the fig, in general growth, resemblance of leaves, and minute size of its seeds. The flavor of the white mulberry is more like that of fig than the black, though this may not be apparent to all tastes.

Finally, the cheapest way (and it seems to me, the best) is to insert cuttings into places where you wish them to root and remain. This should be done in July or early in August.

Dr. PEIRO.

Bees and Mathematics.

The construction of geometrically perfect cells is not the only mathematical operation performed by bees, according to Abraham Netter, who read a very interesting paper on the subject before the Paris Academy of Sciences. The Revue Scientifique reports that he brought out the following facts:

"Not only is the construction of the cells carried on by mathematical rule, but many operations of the insects also; for instance, the collection of the maximum amount of honey in the minimum time, and the division of the workers among the plants proportionally to the number of plants of the same species. In the hives, the number of bees engaged in ventilation is almost rigorously proportional to the daily increase of weight of honey, etc. Facts of this order relate to arithmetical proportion, while those having to do with cell-building relate to geometric ratios."

M. Netter is of the opinion, however, in spite of this show of apparent intelligence on the part of the bees, that "all their movements, without exception, are of the nature of reflexes;" that is, performed without consciousness, just as we close our eyes instinctively when a motion is made toward them. Translation made for the Literary Digest.

"Reviewlets" from the Bee-Keepers' Review.

BEE-ESCAPES should be placed at the corner of the board, instead of the center. Mr. J. B. Hall, of Ontario, says that the bees race around the edges of the board in their efforts to escape.

ONTARIO, Canada, has a good crop of honey this year. I think that 75 pounds of extracted honey per colony would be a safe estimate; although many report a yield of 100 pounds, and H. G. Sibbald secured an average of 150 pounds from three yards.

WIRE-CLOTH supports for the combs are used by F. A. Gemmill, of Ontario, in the solar wax extractor. Wire-cloth is tacked upon frames laid over the metal bottom of the extractor, and then refuse combs laid upon the wire-cloth. The wire-cloth catches and holds most of the waxons, etc., and prevents them from running down in the wax.

J. B. HALL likes to have each colony occupy the same stand year after year; as it is much easier to remember the characteristics of a colony that always stands in the same place. This is one reason why bees are particular, when taking the bees from the cellar, to place each colony upon its old stand.

For Broods can be treated late in the season, after brood-rearing has ceased, by shaking the bees off upon sealed combs of honey. What little infected honey they carry with them will all be consumed in a short time, long before brood-rearing will again be

Langstroth on... The Honey-Bee

Revised by Dadant—1900 Edition.

This is one of the standard books on bee-culture, and ought to be in the library of every bee-keeper. It is bound substantially in cloth, and contains over 500 pages, being revised by those large, practical bee-keepers, so well-known to all the readers of the American Bee Journal—Chas. Dadant & Son.

Each subject is clearly and thoroughly explained, so that by following the instructions of this book one cannot fail to be wonderfully helped on the way to success with bees.

The book we mail for \$1.25, or club it with the American Bee Journal for one year—both for \$1.75; or, we will mail it as a premium for sending us **THREE NEW** subscribers to the Bee Journal for one year, with \$3.00.

This is a splendid chance to get a grand bee-book for a very little money or work.

GEORGE W. YORK & CO.

commenced. Of course, the combs of sealed honey given the bees must be free from infected honey.

GETTING BEES OFF THE COMBS is the most disagreeable and laborious part of producing extracted honey. Last winter, over at the Ontario convention, one one said that this could be greatly avoided by simply taking off the supers and setting them down near the hive—the bees would desert the super for the hive. Mr. Miller, of Ontario, told me that the securing of this knowledge had been worth dollars to him. He gives the bees a good shaking, which drives down most of them, then sets the super down near the entrance, when the rest of the bees leave the super for the hive. This is the way in which I always have removed surplus comb honey from the hive, until the time came when robbers were troublesome, then I used the bee-escape. Mr. Miller also uses the escape when robbers give any trouble.

SAVES the waste of wax is regarded by Mr. Miller of Ontario, as excellent material for packing bees in winter. It is more compact than forest leaves, and can be packed away in summer with less use of space. It does not wet through readily, even if exposed to a heavy rain. A sort of coating or crust, that will turn water, seems to form on the outside of the mass.

WINTERING BEES in the North is still sufficiently uncertain to allow of its being discussed. Practically there are only two methods—in the cellar and protected on the summer stands. Mr. Jacob Albaugh, of Ontario, proposes to experiment by putting 10 colonies in one big, chaff-packed box. The hives themselves will not be packed in chaff, as he wishes to avoid all that labor, but the bottom and sides of the box are to be made of thin lumber double walled, and filled with dry sawdust. Three hives will face each end of the box, and two face each side, the entrances being placed opposite openings cut through the walls of the box. Cushions will be placed on the tops of the hives, and the cushions will be of such a size as to completely fill the box from side to side above the hives. By this arrangement the work of packing and unpacking consists in simply setting the hives in and out of the boxes; while the combined heat of 10 colonies will assist greatly in keeping up the temperature.

LIGHTING A SMOKER is a quick operation if rightly done. Here is a pointer: When through work don't empty out the fire and unburned material. Stuff some grass in the nozzle to stop the draft, when the fire will gradually go out, leaving some charred brands that kindle very easily. Jacob Albaugh, of Ontario, uses planer-shavings for fuel. When I was at his place he picked up his smoker, poked a hole at one side in the half-burnt remains of the last fire, dropped in a lighted piece of paper, gave another puff or two, tilted up the smoker, put on the cover, and puffed out perfect clouds of smoke, in exactly one-half minute by the watch. We went out in the yard and opened hives, and the smoker stayed lighted. This is way ahead of lighting fresh shavings saturated with kerosene oil.

FLY ESCAPES are needed on the windows of a dwelling as much as bee-escapes are needed on the windows of a honey-house. It was the last of July when I visited the home of Jacob Albaugh, of Ontario, and, actually, there was not one fly in the house. At each upper corner of each window-screen the wire-cloth was pried up one-fourth of an inch by

pushing in two little blocks of wood. Flies get into a house when the doors are opened. Sooner or later a fly goes to the window, runs up to the top, scurries along first to one corner or the other, and if he finds an opening, out he pops, never to find his way in again by the same route. What would we think of a honey-house with crowds of bees hanging around the door that was opened dozens of times a day, and no opportunity for the bees to escape over the tops of the windows? We know that it would be full of bees all the time. A dwelling with screens on the doors and windows is an exact parallel. Put escapes at the tops of windows and there is no necessity for sticky fly-paper.

HONEY AND BEESWAX

MARKET QUOTATIONS.

CHICAGO, Aug. 22.—White comb brings 15c per pound for the choice grades, with other lines not grading No. 1 selling at 13c-14c; light amber, 12c-13c; dark, 10c-11c. Extracted honey in carboys at 5c-6c for white, and 5 1/2c-6c for amber; dark grades, 5c. Beeswax steady at 30c for choice yellow.
R. A. BURNETT & Co.

CINCINNATI, Aug. 10.—The honey market is rather dull on account of the warm weather. Extracted sells only to manufacturers from 5c-6c; better grades of a fair water-weight from 6c-7c; white clover from 8c-9c. Fancy white comb honey sells from 13 1/2c-15c.

C. H. W. WEBER.

BOSTON, Aug. 17.—Our market to-day is about 16c-17c for fancy; A No. 1, 15c-16c; No. 1, 14c-15c. Extracted, full supply, light demand.

Several lots of new Vermont honey in carboys have thus far been received, meeting a ready sale at 17c, although of course in a small way. The trade generally seems disposed to hold off, looking for larger receipts and lower prices. This is somewhat due, of course, to the fact that the demand is still light owing to the warm weather. Cooler weather will make a better demand and naturally will cause a better selling.

BLAKE, SCOTT & LEE.

ALBANY, N. Y., Aug. 20.—We quote: Fancy white comb, 16c-17c; No. 1, 15c-16c; No. 2, 14c-15c; mixed, 12c-13c. Extracted, light, 7c-7 1/2c; mixed, 6c-6 1/2c.

H. R. WRIGHT.

OMAHA, Aug. 8.—New comb honey is arriving by express in small quantities from Iowa and Colorado, and selling at \$3.50 per case in a retail way. California extracted honey is being offered carlots at 4 1/2c-5c per pound, f.o.b. California shipping-points, but we have not heard of any sales having been made thus far. The production of extracted honey seems to be quite large this year in Colorado, Utah and California.

PEYCKE BROS.

NEW YORK, Sept. 10.—Comb honey is now beginning to arrive in large quantities, and, as a rule, quality is fine. The demand is good, and we quote as follows: Fancy white, 14c-15c; No. 1, 13c; No. 2, 12c; and amber, 11c. No buck-wheat is on the market as yet, but we are expecting some within a week or so. Extracted is selling slowly, with plenty of supply, at 5c-6c, according to quality, and Southern in barrels at 2c-2 1/2c per gallon. Beeswax dull at 26c.

HILDRETH & SEIGLER.

DES MOINES, Aug. 7.—There is very little doing here in new crop of honey. Some small lots of near-by produced comb honey are on the market and selling in a retail way at 33c to 35c per case. We do not look for much trade in this line before Sept. 1. Our market does not consume a great deal of extracted honey.

PEYCKE BROS. & CHANEY.

DETROIT, Aug. 12.—Fancy white comb honey, 14c-15c; No. 1, 13c-14c; no dark to quote. Extracted, white, 6c-7c. Beeswax, 25c-26c.

M. H. HUNT & SON.

BUFFALO, Aug. 10.—Quite a good demand for fancy honey, 16c-17c, and lower grades, 12c-14c, neglected. Advise moderate shipments only of new as yet.

BATTERSON & CO.

SAN FRANCISCO, Aug. 14.—White comb, 11c-12c; extra, 8c-10c; dark, 6c-7c. Extracted, white, 5c-6c; light amber, 4 1/2c-5c; amber, 4c-4 1/2c. Beeswax, 26c-28c.

Market continues quiet, with apiarists, as a rule, unwilling to unload at prices generally named by wholesale operators. Our quotations represent as nearly as possible the values ruling at this date for round lots, although few sales could not probably be effected at full figures, while, on the other hand, higher prices are quoted are being realized in the filling of some small orders.

KANSAS CITY, Aug. 6.—Some very fine Missouri honey is now on the market, selling at 16c-17c per pound for fancy white comb. Colorado and Utah shippers are offering new comb honey in carlots for first half of August shipment at 10c per pound for No. 1, and 9c-10c for No. 2, f.o.b. shipping-point. The market for extracted honey is as yet rather unsettled, as no steady prices ranging from 4 1/2c-5c, f.o.b. shipping-point. Buyers, however, seem to be in no hurry to make contracts.

If more convenient, Dues may be sent to the office of the American Bee Journal, when they will be forwarded to Mr. Secor, who will mail individual receipts.

A Celluloid Queen-Button is a very pretty thing for a bee-keeper or honey-seller to wear on his coat-lapel. It often serves to introduce the subject of honey, and frequently leads to a sale.

NOTE.—One reader writes: "I have every reason to believe that it would be a very good idea for every bee-keeper to wear one [of the buttons] as it will cause people to ask questions about the honey bee, and many a conversation thus started would wind up with the sale of more or less honey; at any rate it would give the bee-keeper a superior opportunity to enlighten many a person in regard to honey and bees."

The picture shown herewith is a reproduction of a motto queen-button that we are furnishing to bee-keepers. It has a pin on the underside to fasten it.

Price, by mail, 6 cents; two for 10 cents; or 6 for 25 cents. Send all orders to the office of the American Bee Journal.

No. 1 "Barler Ideal" Oil-Heater.

The "Barler Ideal" OIL-HEATER ...

Saves Its Cost Every Year!
NO ODOR! NO SMOKE! NO ASHES!

Costs only a cent an hour to run it.

The editor of the American Bee Journal is using the "Barler Ideal" Oil Heater, and it is all right in every way. We liked it so well that we wanted our readers to have it too, so we have recently arranged with its manufacturers to fill our orders. The picture shown herewith is the one we recommend for general use. It is a perfect gem of a stove for heating dining-rooms, bed-rooms, and bath-rooms. It hinges back in a substantial way, and is thoroughly well made throughout. The urn removes for heating water. The brass fount, or well, has a ball, and holds nearly one gallon of kerosene oil. It is just as safe as an ordinary lamp. You wouldn't be without it for twice its cost, after once having one of these stoves. Most oil-stoves emit an offensive odor, but this one doesn't. Its height is 2½ feet, and weighs 20 pounds, or 30 pounds, crated ready for shipment, either by freight or express.

Price, f.o.b. Chicago, \$6.00; or, combined with a year's subscription to the American Bee Journal—both for only \$6.50. FULL DIRECTIONS GO WITH EACH STOVE.

If you want something that is really serviceable, reliable, and thoroughly comfortable, you should get this "Barler Ideal" Oil Stove, as it can easily be carried by any woman from one room to another, and thus have all the heat you want right where you want it.

Please Mention the Bee Journal when writing Advertisers.....

The Novelty Pocket-Knife.

Your Name and Address on one side—Three Bees on the other side.

[THIS CUT IS THE FULL SIZE OF THE KNIFE.]

Your Name on the Knife.—When ordering, be sure to say just what name and address you wish put on the Knife.

The Novelty Knife is indeed a novelty. The novelty lies in the handle. It is made beautifully of indestructible celluloid, which is as transparent as glass. Underneath the celluloid, on one side of the handle is placed the name and residence of the subscriber, and on the other side pictures of a Queen, Drone, and Worker, as shown here.

The Material entering into this celebrated knife is of the very best quality; the blades are hand-forged out of the very finest English razor-steel, and we warrant every blade. The bolsters are made of German silver, and will never rust or corrode. The rivets are hardened German silver wires; the linings are plate brass; the back springs of Sheffield spring-steel, and the finish of the handle as described above. It will last a last-time, with proper usage.

Why Own the Novelty Knife? In case a good knife is lost, the chances are the owner will never recover it; but if the "Novelty" is lost, having name and address of owner, the finder will return it; otherwise to try to destroy the name and address, would destroy the knife. If traveling, and you meet with a serious accident, and are so fortunate as to have one of the "Novelties," your POCKET-KNIFE will serve as an identifier; and in case of death, your relatives will at once be notified of the accident.

How appropriate this knife is for a present! What more lasting memento could a mother give to a son, a wife to a husband, a sister to a brother, or a lady to a gentleman, the knife having the name of the recipient on one side?

The accompanying cut gives a faint idea, but cannot fully convey an exact representation of this beautiful knife, as the "Novelty" must be seen to be appreciated.

How to Get this Valuable Knife.—We send it postpaid for \$1.25, or give it as a Premium to the one sending us THREE NEW SUBSCRIBERS to the Bee Journal (with \$3.00). We will club the Novelty Knife and the Bee Journal for one year, both for \$1.00.

GEORGE W. YORK & CO.

St., Chicago, Ill.

Please allow about two weeks for your knife order to be filled.

ESTABLISHED IN 1861 AMERICAN THE OLDEST BEE-PAPER IN AMERICA BEE JOURNAL

No. 39.

* Editorial. *

Bees and Pear-Blight.—The fruit and bee men of California seem to be sensible enough to get along without quarreling and lawing, and certainly some of the bee-men show an excellent spirit. They have agreed to move their bees away from the pear orchards during the blooming period, so as to help solve the question whether the bees are the chief criminals. The views of some of the scientific men are given in *Gleanings in Bee-Culture*. Prof. Waite seems inclined to pass judgment against the bees, but at the same time considers them a necessary evil, for he says he has found as the result of an extensive series of experiments "that bees are indispensable to the pollination and setting of most of our pomaceous fruits." Prof. Cook says:

"I have little doubt that bees do aid in scattering the virus; but I am far from convinced that their removal will abate the trouble, or is wise and necessary."

Prof. Gillette thinks it will be a considerable time before we can draw any positive conclusions. He thinks that if the bees were the chief operators the late varieties of pears should suffer more from blight than the early ones, and he has not observed this to be the case.

"Honey Without Bees"—Dr. R. H. Strickland, of Perry Co., Tenn., sends us the following, which appeared in an advertisement taken "from a scientific (?) quasi-medical journal":

HONEY WITHOUT BEES.

This is an age of marvelous discoveries and inventions. Every day brings forth something new, and every year is marked by some astounding discovery which completely upsets all preconceived notions in some department of knowledge or industry. Marvelous discoveries have been made in electricity and the uses of steam and the utilization of the various forces of nature, but a discovery which is really more far-reaching in its results, and perhaps capable of immediately benefiting a larger number of persons, is a process worked out by an eminent physician by years of laboratory research, whereby it is possible to make honey directly from wheat and other cereals without the aid of chemicals of any sort, and by a process essentially identical with that by which honey is manufactured by plants ready to be collected and stored by the cunning little feet of the honey-bee.

Malt honey, or melrose, looks like honey, tastes like honey, in chemical composition is essentially the same as honey, and as a food is superior to honey, since it is free from germs, pollen, fragments of flowers, dust, and other foreign matters, and may be eaten without in-

jurious effects, even by most delicate individuals, whereas many persons can not eat honey, even in small quantities, without experiencing ill effects. *Malt honey is genuine honey; not an imitation or a substitute, but the real thing, derived from the original source—the plant—but without the assistance of bees, and by a process which renders it absolutely pure and wholesome. It is the only sweet which can be eaten in liberal amounts without injurious effects.*—(Italics are ours.—Ed.)

We feel a just pride in the perfection of this very remarkable and useful product, after spending some years and thousands of dollars in research for the purpose.

Dr. Strickland says in his letter accompanying the foregoing, "It may not be worth noticing." Well, it certainly wouldn't be "worth noticing" were it not for the manner in which the thing is described and advertised.

If its discoverer doesn't know any more about food products than he does about the way bees gather and store honey, he is truly a fine specimen of ignoramus. Think of bees collecting and storing the nectar of flowers with their "cunning little feet!" If that were true, they ought to store about six times as much as they do, as they have six times as much feet as tongue. If this learned (?) food inventor were right, bee-keepers would be breeding for more and longer feet than for longer tongue-reach in their bees.

Well, we secured a sample of the wonderful (?) "melrose" that is said "looks like honey, tastes like honey, and in chemical composition is essentially the same as honey," etc. If honey were like it, we would care for no more honey. It has a taste (to us) almost like sorghum molasses, is thick and cloudy, resembling in appearance a poor quality of glue or muckilage. If we were to put up for the Chicago grocery trade stuff like it, and call it honey, we would expect to kill our trade on the first round among our customers. And yet, the great inventor of "melrose" says it is "genuine honey"—"the real thing!" True, he says bees had nothing to do with its manufacture—and we believe him. Bees wouldn't degrade themselves by turning out a product like "melrose"—not from the blossoms of white clover, basswood, sweet clover, etc. The idea of man claiming he can make honey equal, or superior, to that produced by bees! (Of course we mean the best grade of extracted honey, not honey-dew.)

From the glowing advertisement of "melrose," one might be led to think it is a sort of comb honey. It isn't. It is simply an imitation of extracted honey, and we consider it a poor one at that.

We do not say that melrose has no valuable food qualities—we know nothing about that part of it. What we object to is the claim that the stuff is the "same as honey" (there-

honey), "the real thing," etc. Also, the attempt to prejudice the public against genuine bee-honey, by claiming that it contains "injuriously" germs, pollen, fragments of flowers, dust, and other foreign matters," deserves to be severely condemned. No honorable man or firm would do that.

It's a pretty safe thing to shun people who claim they have "genuine honey" that was produced "without bees!"

Sugar for Bee-Feed.—For years a difference of opinion has prevailed as to the best kind of sugar to use in feeding bees. Those who are supposed to know tell us that granulated sugar made from beets is identical with that made from sugar-cane. But things that are identical from a chemical standpoint are not always the same, as witnessed by the familiar instance of diamond and charcoal; and across the ocean it has been earnestly insisted that sugar from beets was unfit for bees, and that cane-sugar alone should be used. If it were easy to be sure of getting cane-sugar, the safe thing would be to use that alone, but one can not be sure of what granulated sugar is made, and the amount of beet-sugar is all the time on the increase. Since we are in a manner forced to use what is very likely to be beet-sugar, we may take some comfort from the experience of Editor Root, remembering that the proof of the pudding is the eating. He says in *Gleanings in Bee-Culture*:

Personally I do not have any uneasy feeling about the sugar question. It is not proper for us to boast; but for the last 10 or 12 years we have used beet-sugar for feeding our bees; and if any one can show a higher wintering average than we—one who has used cane-sugar—we should like to have him hold up his hand. Our wintering losses very often do not exceed 2 percent, and the very highest is 15 percent, I believe. This covers a period of about 20 years. I suppose a fair average would be between 3 and 4 percent. If Mr. Morrison is correct, the beet-sugar is better than cane. But my honest impression is that, with either sugar, we shall get good results. The trouble from sugar-fed colonies is more because the syrup is fed too late or too thick, and the bees do not have opportunity to ripen it. If it is fed during warm weather, when they can fly, half and half, other things being what they ought to be, I would not give two cents to have the colonies insured.

A New Honey-Plant is announced every now and then, and at different times there has been a sounding of trumpets over some new plant that was to be kept by the acre and give wondrous yield, as, for instance, the Simpson honey-plant, figwort, and Chapman honey-plant. Acres of ground were planted with these, and at the instigation of bee-men the Government made an appropri-

tion to distribute the seed of one of them, but at the present day little is heard of them, and it is not likely that any one considers it advisable to make a plantation of either of them.

It seems pretty well settled that to make it profitable to occupy tillable land with any honey-plant, that plant must have a value aside from its honey-yielding properties. Hopeless as the case may be considered with regard to any plant for honey alone, there is always a possibility of the discovery of some plant of value for other purposes which has the additional value of being a honey-yielder. Even the remote possibility of such a thing makes it worth while to experiment with a large number in the hope that out of the many there may be found one that will be profitable.

In the National Stockman and Farmer, the winter or hairy vetch receives high praise as a plant for feeding and other purposes, but no mention is made of its honey-yielding qualities. In a late number of that excellent farm journal J. A. Macdonald speaks upon that point after this wise:

Some months ago I made mention of the winter or hairy vetch in an article in the National Stockman and Farmer, but in mentioning many of its various points of value, as a sowing plant, pasture plant, manurial value, etc., I did not observe that this vetch was a splendid honey-plant, and that clover does not begin to compare with it in this regard, for the reason that the time of bloom of clover is comparatively short beside hairy vetch. I wonder if any of your readers have noticed this new value of this vetch; if they have, they have taken very good care to keep the information to themselves. Your valuable correspondent, Mr. Lighty, and a bee-man, too, has spoken, in your columns, of the many valuable attributes of the hairy vetch, but I must confess, having failed to see any mention by him of the honey-yielding qualities of the plant, and I would now ask him to say if he ever noticed this point of value.

First, let me say that there is no more beautiful sight than to look upon a field of hairy vetch in its full purple bloom, and this view presents itself for a very long time, and this is why such a remarkably fine honey-plant, supplying nectar to the bees for weeks together, see this vetch, when sown in spring, is very early in maturing seed, but continues to put forth new bloom from week to week, and a bloom which the bees are exceedingly fond of. On a patch of this vetch sown May 10, I notice bloom about the first week in July, but it was not until three weeks later, or the last week in July, that it appeared in full bloom, and still at this date (Aug. 9) it is showing a brilliant bloom, though pods are maturing on the lower portions of the plants. For the last ten days the plants are literally covered with bees. A few days ago I tried to estimate the number of bees flitting from bloom to bloom, and as far as I could see, there was an average of ten bees to the square yard, that is, in the immediate vicinity of the particular spot where I was standing. Some say there are no more than four or five bees working to the square yard, but no matter what time of the day I go into that vetch patch (which, by the way, we are cutting for partial sowing of cows and pigs), there are lots of bees working industriously.

Hairy vetch is a wonderful plant indeed, so many points of value has it. As a sowing plant mixed with a little oats, it's a wonder and ahead of anything I ever saw. Pears don't begin to compare with it at all. As a pasture for swine it is fine, and though I never cured any of them, I can not but believe it must be good for this purpose, too. As a spring crop with me it is ahead of a winter crop, and produces about seven tons of green foliage per acre, and lastly constitutes wonderful value as a honey-plant. I wish bee-men everywhere would give the plant a trial for its honey-giving qualities; and I would greatly wish to hear from those who have the

hairy vetch growing to report its value in this regard.

Now in the hands of others this plant may or may not be found of value. The probability is that in some localities it will deserve the kind words with which Mr. Macdonald speaks of it, while in others it will be of little value. But the possibilities in the case warrant a thorough trial on a small scale. Its long period of bloom, and its continuance in bloom after white clover is done are special points in its favor wherever it is found to be a success.

Has any one of our readers had any experience with the plant? Has any one any further knowledge of it? If so, let us have all the light possible about it.

Weekly Budget.

PRESIDENT WILLIAM McKINLEY—the most widely respected and honored president of the United States in two decades—was shot down by an anarchistic demon in human form, while he was holding a reception at the Pan-American Exposition at Buffalo, Sept. 6. The terrible wounds resulted in his death early Saturday morning, Sept. 14.

Of course, this is no news to the most of our readers, as the daily press has been crowded for almost two weeks with columns upon columns of matter bearing on this awful event. It is almost too sad and terrible to write about. There should be no room for a single anarchist in this "land of the free and home of the brave." We strongly favor the suggestion that all the anarchists in this country be exiled to two high-walled islands of the sea, the men to be assigned to one island, and the women to the other. Give them sufficient to eat as long as they live. After that the "breed" would beat an end.

We have not the slightest sympathy for those who would shoot down any one placed in official position, and the sooner such dastardly cowards are humanely and effectually disposed of the better for all concerned.

GETTING LATE FOR QUEEN-ORDERS.—On account of the season getting late—cool weather, etc.—we wish to announce that we will be unable to accept any more queen-orders to be filled this season. We appreciate very much the queen-patronage that has been extended to us this year, and trust that it may continue next season. We also hope that all the queens received through us may prove entirely satisfactory, as we believe they will.

HON. J. M. HAMBAUGH, writing us from San Diego Cal., Aug. 31, had this to say:

FRIEND YORK: The reliable, old American Bee Journal, boon companion to the wide-awake bee-keeper, cometh regularly, and is always welcome here in this away-away-and the Sunny Pacific Slope. I am afraid there are very few bee-keepers that can fully appreciate the energy and grit of the Editor who so faithfully compiles and prepares a weekly intellectual feast for its patrons upon topics relating almost exclusively to the honey-bee. Long may the old, faithful American Bee Journal live and prosper under the guidance

of our "auld lang syne" friend, George W. York, in our sincere wish.

It seems that fate has placed me at the extreme western limit of Uncle Sam's domain, where I am isolated from the haunts of my early life. Yet I can truthfully say I have no regrets, and have many reasons to be thankful, chief among which is an added lease upon life. Myself and family have enjoyed much better health here than we did in the East. The daily visitations of the cool, invigorating salt-breeze atmosphere is a panacea for almost every human ill, and hundreds and thousands at this season of the year lie away to the banks of the everrolling, restless ocean, to bathe in its cooling sea, and rest from the business cares of life. I imagine that could you but be suddenly transferred from your murky, blistering Chicago furnace to the banks of our Pacific cline, you would be suddenly impressed with the wide contrast, and would only wish to tarry here the balance of your mortal career.

Respectfully yours, J. M. HAMBAUGH.

Thank you, Mr. Hambaugh, for such expressions of kindly feeling and appreciation. Such go far toward resting the tired head and hand that often become so through the incessant efforts necessary to be put forth in order to send out the old American Bee Journal every week in the year. But, after all, it is a pleasant work. And one can keep on doing it with an honest feeling that he is really and truly helping some one—yes, helping many, who want and need just such aid as this journal gives.

To all our increasing thousands of readers we pledge continued effort and devotion, health and strength permitting.

HOME AND APIARY OF J. W. ADAMS.—On page 615 will be found a picture of "Oak Grove Apiary," belonging to Mr. J. W. Adams, of Montague Co., Tex. He took his first lessons in bee-keeping from his grandfather when he was a mere boy, but never kept bees until after he was married. He moved to Texas in 1881, and seeing so many bees there the old desire to keep them was revived, and so he bought some black ones in box-hives; these he transferred to Langstroth hives, and by making a study of the bees, and reading all the books he could secure, he has made a success of the business. He is also a farmer and stock-raiser.

Mr. Adams secured about 100 pounds of comb honey per colony last season (1900), which he sold at 12½ cents per pound; he gets 9 and 10 cents per pound for extracted honey, and has no trouble in selling all the honey he can produce, at these prices, and the middle of June he was behind 1000 pounds on his orders. He is the only practical bee-keeper in that locality, but through his efforts some have become interested in bees, and others have begun to improve their stock, and adopt the standard hives.

In the picture, the little girls to the left are Mr. Adams' daughters, the little one in the buggy is the baby, and the young man in the background is his eldest son, who has charge of his queen-business.

MR. A. N. TYLER, of Tyler Bros., located in Sutter Co., Calif., called on us last week. This firm of bee-keepers have 1800 colonies of bees, and their crop this year was about 20 tons—only about a quarter of a crop, so Mr. Tyler says. He thought the total amount of honey in California this year would be about 250 car-loads. This is perhaps half of a full yield. Quite a lot of sweetness, however, and will likely have noticeable influence on the honey market of the country.

Contributed Articles.

The Honey Market and Crop in California.

BY GEO. W. BRODBECK.

WE, bee-keepers of Southern California have been forced to confront conditions in the marketing of our product this year that we have never been obliged to face before; and I firmly believe that if the majority of our bee-keepers were patrons of our leading bee-papers, this state of things could not exist.

Every season we are informed from outside sources (and sometimes within), that Southern California will have an enormous crop of honey, and it matters not whether the conditions are favorable or not (last year as an illustration), with the consequent result prices are established before the honey is ready for the market and the amount produced is unknown. This year has not been an exception in this respect to the past, but that which has lent additional interest and more than all else to depress the market, has been the action of some within our own ranks. The object, of course, is self-evident, for the circulation of the rumor of a large crop has a depressing influence upon the bee-keeper who is forced to sell, and when the middleman quotes a well-known bee-keeper as authority, it lends force to the statement; and as the former has no means at hand to know of the vast quantity of honey that has been shipped to the United States from Cuba, Hawaii, and Puerto Rico, (this information is supplied by the buyer or go-between), knowing not whether it is true or false as to state of market, etc., he quietly submits and sells for the price offered.

We all know beyond question, that at the beginning of this season we had less than one-half of the bees to produce a crop with than four years ago, and yet the statement has gone forth that we produced as much, and more, than we did four years ago. I know beyond question that we have many honest buyers, and I know of bee-keepers who have been aiding these men in a legitimate way, but when men from our own ranks circulate statements with the express view of depressing the market, and thereby affording them a profit, I think it is time the California bee-keepers were warned against their practices, and it is this which prompts this article.

While I am not disposed to pose as authority in regard to this year's crop, information from some of our leading bee-keepers, and other sources, indicates that we have produced about 150 car-loads of honey, all told. Over half of this has been marketed. Comb honey has been produced in limited quantities, due to unfavorable conditions, and this has nearly all been disposed of. The remainder of our product is in the hands of men who can hold it indefinitely.

Los Angeles, Calif., Sept. 7.

How Do Bees Manage to Survive the Winter?

BY "AN OBSERVER."

BEES survive the winter by packing themselves in clusters between combs of waxen cells filled with honey.

The low temperature a cluster of bees so situated can resist and still keep alive is really marvelous, and is only paralleled, in the other extreme, by the degree of heat a bacillus spore can withstand without losing its vitality.

Water, if kept from circulating, is as bad a conductor of heat as eider-down (see "Encyclopedia Britannica," ninth edition); and honey, for the same reason, contained in wax cells 1.5 inch in diameter and $\frac{1}{2}$ inch deep, must be an exceedingly bad conductor. We can, therefore, presume that although some heat must be lost, the loss through the combs may be reckoned as nil. The cluster loses heat around the outer circle, at the periphery; the circumference is the radiating and cooling area.

Now, if we take a cluster of bees, say 10 inches in diameter and $\frac{1}{2}$ inch thick—about the distance between the combs—we find that the cluster would be very nearly 40 cubic inches in volume, and the radiating or cooling area would be 15 $\frac{1}{2}$ superficial square inches; three cubic inches of bees, therefore, only expose to the cold a little over one

square inch of surface. If we take a cluster 5 inches in diameter we find the volume to be 10 cubic inches, and the radiating surface or area 7 $\frac{1}{2}$ square inches; and, if we take a cluster 4 inches in diameter, the volume would be 6 $\frac{1}{4}$ cubic inches and the cooling area 6 $\frac{1}{4}$ square inches. The 10-inch cluster has, therefore, three times the advantage of the 4-inch cluster, and, in proportion to volume, three times more heat will be required to keep up the temperature of the smaller cluster.

The relation of volume to cooling area may be shown thus: It would take the bees contained in four clusters of 4 inches in diameter to make one cluster 8 inches in diameter, and the cooling surface of the 8-inch cluster would be one-half of the cooling area of the total of the separate 4-inch clusters. The bees, therefore, in the larger cluster would require only one-half the heat to keep up their living temperature that they would in the smaller clusters.

If we take a cluster one inch in diameter the volume would be the half of .7854, say four-tenths of a cubic inch, and the cooling area the half of 3.1416, say 1 $\frac{1}{2}$ square inches; the cooling area is, therefore, proportionally four times greater than in the 4-inch cluster, and is too large to allow of much fall in temperature with safety to the bees. So small a cluster could not exist in winter, except at the equator or near to it.

The individual bee is very sensitive to cold, but we must remember that a cubic inch exposes 6 square inches of radiating surface, and that the volume decreases or increases as the cube, and the surface as the square. A bee in mass or volume is less than the sixty-fourth of a cubic inch, and its radiating, cooling, or heating surface is more than one-third of a square inch. Assuming the sixty-fourth of a cubic inch to be a cube, its surface would be three-eighths of a square inch. This cube would therefore expose a radiating surface proportionally twenty-four times greater than the 4-inch cluster. The single bee, when incorporated in the 10-inch cluster, must be afforded over sixty times more protection from cold than it would possess outside the cluster.

The space between the combs is important. We will consider the distance between the combs in reference to the cooling area, and at the same time the supply of food, as these are closely related. The 10-inch cluster, between combs $\frac{1}{4}$ inch apart, is surrounded by 80 cubic inches of honey—supposing the cells to be full—and as a cubic inch of honey weighs .05 of a pound there are 4 pounds of honey within reach of the cluster for the bees to feed upon. We will now suppose the combs to be one inch instead of $\frac{1}{4}$ inch apart; the bees clustering close would occupy 7 inches instead of 10 inches—the volume is not changed, it remains 40 cubic inches. The cooling area, however, has been increased to 22 superficial inches, and the honey within the immediate reach of the cluster has been reduced to 2 pounds; in place of 2 cubic inches of honey to the cubic inch of bees, we have only one cubic inch of honey to the cubic inch of bees. The food supply has been diminished 50 percent, and the cooling area of the cluster increased 40 percent. The bees must therefore consume 40 percent more honey to keep up their temperature; and this increase of consumption and decrease of supply would necessitate their change of quarters in search of food in one-fourth the time required had they remained at the $\frac{1}{4}$ -inch distance. It must be understood, in reference to increasing the cooling area and the correlative consumption of food, that the capacity of the bees to keep up temperature by feeding is limited, and in a badly proportioned cluster, i.e., a cluster radiating more heat than the bees can generate, the bees will die with an abundance of stores around them.

When the depth of the combs allows the bees to locate their stores above the brood-cells, they always lengthen the store-cells so as to leave only $\frac{1}{4}$ inch space between the combs. Let us see what the bees gain by diminishing the distance. Taking the 4-inch cluster between combs $\frac{1}{2}$ inch apart, it would have to extend itself to nearly 5 $\frac{1}{4}$ inches to remain the same in volume at the $\frac{1}{4}$ inch distance. The cooling area would now, from diminishing the distance, be reduced 30 percent, and the honey within the immediate reach of the bees would be increased, from 2 cubic inches to the cubic inch of bees, to 5 cubic inches to the cubic inch of bees—that is, 150 percent.

From the facts here stated I think it is evident that the size of the cluster and the depth of the combs are really the essential requisites for wintering, and that, as a general rule, the size of the cluster and depth of combs must increase with the degrees of latitude. As the combs increase in size, they must, of course, be diminished in number, and if the construction of the hives should not

admit of the requisite sized combs for the latitude in which they are to be used, the bees will not be able to winter successfully in them.

The fecundity of the queen, so far as we know, does not vary with the latitude and can not, therefore, be brought to bear on the subject in regard to the general area of combs used.

The bees survive through the winter by preserving as well as they possibly can the heat of their clusters; and as the general interior temperature of the hive can only be raised by the loss from these clusters, it follows—paradoxically, as it may appear—that the colder the general interior of the hive the better are the bees wintering, through the preservation of heat in their clusters; and it also follows that if upward ventilation, or draught, through the hive is prevented—which draught the bees dread above all things—the entrance to the hive can not be too large.

In the spring, however, when the bees extend from the cluster over their combs, warmth in the general interior of the hive has its advantage; but if great enough to cause the bees to leave the clusters too soon, it might be productive of more harm than benefit.

The controversy concerning the merits and demerits of cold and warm hives by the presentation of the above facts is reduced in importance. The main object to be considered is their construction to admit of combs adapted to the size of bee-clusters required in various latitudes.—British Bee Journal.

No. 2.—A Bee-Keeper's Vacation in Wisconsin.

BY C. P. DADANT.

FRIEND reader, last week I left you after telling you a fish story, yet I have no doubt that you wish you had been along with me when those fish were caught. But this happy neighborhood has other attractions besides good fishing, for they tell me that there are both deer and bear in the woods around Sturgeon Bay. I was rather inclined to doubt the existence of the latter in a section already so well populated, but having had occasion to take a drive into the country for a visit to an apiarist, the lady who accompanied us showed us the spot where she had been badly frightened by the appearance of a bear while walking along the road. "And," said she, "though I turned to run, the bear was as badly frightened as I was, for he also turned and ran the other way."

The woods are indeed wild, in spots, more brush than timber, for all the good timber has long ago been cut, and made into lumber, and the forest fires have destroyed what had not been despoiled by human wastefulness. The thickets are so dense that it is, in some places, almost impossible to get through, and they say that in the deer-hunting season it is not very safe to travel about in those woods, not on account of the bears, but on account of the careless hunters who are apt to shoot at anything that they see moving in the thickets, before they have ascertained what sort of game it is.

Those woods contain all sorts of evergreens and many deciduous trees, chief among which are the beech and birch. There are also shrubs, blackberries, and the inevitable red raspberry, which I am told exists all over the North, clear up to Alaska and the Klondike. This is certainly a very nice thing for the bees, and if the honey from the raspberry is half as fragrant as the wild berries themselves, it must be delicious. But it may be with this as it is with the early fruit-bloom in Illinois, perhaps the colonies are not sufficiently powerful at the time of the bloom to take any advantage of it. But there is plenty of this bloom, for the waste land and the woods are full of red raspberries.

The white pines that formerly composed the bulk of the forests in those parts have disappeared, and if you accidentally notice one, towering above the rest of the forest in lonely majesty, you may be sure that its trunk is defective and rotten at the core, for that is the only thing that could have saved it from the ax. When the first settlements were made, the main puzzle for the white man was how to get rid of the wood, and we can still see traces of an awful waste of timber that would now be valuable. I saw a small apiary in an enclosure made of trees two to three feet in diameter. Two logs had been rolled side by side, and a third one put on the top of them, making a barrier about four feet high and four feet in diameter at the base. Of course this fence was old, probably 25 years or

A TUG-BOAT TOWING SAILBOATS ON THE LAKE.

more, but it was still sufficient to keep out stock, and stood as a witness of the haste with which people destroyed the forest. May we not, as a nation, be sorry later on, for not having retained at least a part of those beautiful forests? The pine timber is getting more expensive, and experienced lumber-men predict that within ten years most of the pine will have to be purchased in British America. Already most of the timber on the shores of the big lakes has been picked over, even on the Canadian side, and although many and many a boat-load is seen coming southward towards Chicago and the big centers, yet the quantity is less than formerly. Some saw-mills are cutting only hemlock, such timber as was considered worthless 20 years ago.

But the destruction of the forest does not seem to injure the bee-industry, for if many wild plants are thus destroyed, it is there as in our prairie States, many of the cultivated plants are honey-yielders, and the white clover steadily gains a foothold wherever cattle graze. So the prospect is rather for an increase of honey-production than for a decrease. And the Golden Age, in a country "flowing with milk and honey," is certainly more in the prospective future than in the past, in all these bills that have seen the Indian disappear when the white man came.

But, dear reader, it is now time to go home, and our vacation is coming to an end. At ten o'clock, Monday morning, the whistle of the "Chicago" boat announces to us that she is at the dock, waiting for her passengers, and we bid farewell to our new acquaintances, and embark. "Grandpa" Dadant, who is to stay till the end of September, accompanies us to the boat. In another hour we pass through the Ship Canal, and are afloat on the blue waters of Lake Michigan. We give you herewith a view of one of the many sights we encounter—a tug drawing three sailships loaded with lumber, bound for some southern port. This view may be familiar to many of our Chicago friends, but it will surely interest our prairie bee-keepers, who have no occasion to visit the lakes.

On the second day of our trip we had a little storm, just enough to give our ladies an idea of seasickness, and its pleasures (?); but this was soon over, and gave them just that much more appetite for a hearty supper in a Chicago restaurant.

When we arrive in Chicago, the romance is at an end. There is nothing left but noise and bustle, smoke and dust. No, no, don't talk to me of Chicago! We hurry home as soon as we can, barely taking time to pay a short visit to our worthy friend, Mr. York, the kindly editor of the American Bee Journal. In a few hours, through smoke and dust, we are again at home, resuming the daily duties of life. Hancock Co., Ill.

"The Hum of the Bees in the Apple-Tree Bloom" is the name of the finest bee-keeper's song—words by Hon. Eugene Secor and music by Dr. C. C. Miller. This is thought by some to be the best bee-song yet written by Mr. Secor and Dr. Miller. It is, indeed, a "hummer." We can furnish a single copy of it postpaid, for 10 cents, or 3 copies for 25 cents. Or, we will mail a half-dozen copies of it for sending us one new yearly subscription to the American Bee Journal at \$1.00.

Convention Proceedings.

Report of The Texas Bee-Keepers' Convention.

BY LOUIS SCHOLL, SEC.

THE seventh annual meeting of Central Texas Bee-Keepers' Association was held at College Station, Tex., July 22 to 26, 1901. It was really a joint meeting of the Central Texas, North Texas or Texas State, and South Texas Bee-Keepers' Associations. The three were consoli-

The call for new members was ordered postponed, as a committee appointed by the chairman, on constitution and by-laws, was to make its report at the afternoon session. This committee consisted of Louis Scholl, H. H. Hyde, and F. L. Aten. Then the regular subjects on the program were taken up, E. J. Atchley speaking on

BEE-KEEPING FOR FARMERS.

He hardly knew whether to encourage farmers to keep bees or not. He mentioned some of the things he had seen at a neighbor's, who was a good farmer, trying to keep bees, and making blunders. If they would only keep a few colonies, and produce only enough honey for their own use and table, it would be all right. When keeping more, and during an extra-good year, they have a surplus, which they rush to a town, lump it off for any old price, and it being

HOME AND APIARY OF J. W. ADAMS, OF MONTAGUE CO., TEX. (—See page 612.)

dated into one, viz: "The Texas Bee-Keepers' Association," with new officers elected, and new constitution and by-laws adopted.

The meeting, in general session assembled, was called to order by Pres. O. P. Hyde, of the Central Texas Association, July 24, at 8 a.m., with Pres. Stachelhausen, of the South Texas, and J. M. Hagood representing the North Texas Association, in the chairs; Secretary E. J. Atchley, of the South Texas, and Sec.-Treas. Louis Scholl of the Central Texas, at the desk. Pres. Hyde spoke briefly on the honey-bee, after which Mr. Atchley offered prayer.

The presidents next made their reports, followed by that of the secretaries, each giving an account of the standing of their respective organizations. Next, the election of officers of the Central Texas Association ensued, and resulted in electing, for the ensuing year, J. B. Salyer, president; H. H. Hyde, vice-president; and Louis Scholl re-elected Secretary-Treasurer.

mostly honey of an inferior quality, besides their not being informed in regard to the price of honey and the condition of the market, never reading a bee-journal, they run down the price of honey, and are ruinous to the experienced bee-keeper, who is in it to earn his bread and butter; therefore, Mr. Atchley said, it should be discouraged.

J. M. Hagood is in a strictly farming district and is a farmer. He said that the farmers ought to encourage the bee-keepers to keep bees for the good purpose of fertilizing the flowers. He has his home-market and sells most of his honey there, so the effect of the farmers' ignorance and inferior honey, containing old, dark combs with pollen and such, has ruined his market and lowered the price.

G. F. Davidson moved that we invite Prof. Mally, State entomologist at the A. and M. College, to speak before the bee-keepers at the afternoon session, in regard to assistance from the bee-keepers in going before the next special session of the legislature in August, asking for an appro-

piation sufficient to help cover the costs of establishing a department for the study of bee-keeping, and the location of an experimental apiary on the grounds. After some discussion concerning the great need and usefulness of such an establishment, and the great good that could be accomplished, the motion was unanimously carried, and a special committee appointed, composed of H. H. Hyde, G. F. Davidson and R. C. Knowles, to invite Prof. Mally to appear before the bee-keepers. Another committee to assist Prof. Mally, and to go to Austin (Texas) before the legislature, was appointed, viz.: G. F. Davidson, Louis Scholt, J. M. Hagood, and E. J. Atchley.

The regular subject under discussion was then resumed. Z. S. Weaver said that bee-keeping must be followed altogether as a business. He does not encourage farmers to keep bees, but how many would be here now as bee-keepers if not started on their farms? It just depends whether the bees or the farm is the thing one should follow, and of course the one not the best paying is turned loose. Some keep bees as a side-issue, become enthusiastic and succeed, while others fail. If the farmers keep a few colonies of bees for their own use it is all right; otherwise it is not.

O. P. Hyde makes a whole business out of bee-keeping and keeps bees for the dollars and cents there is in it; he has no objections at all to farmers keeping bees, for if he had 100,000 pounds of honey at his home, not 1000 pounds of it would be sold there, as all of his honey is shipped to markets in North Texas. Just let farmers keep bees go on, and the matter will adjust itself some way in the future.

To this Mr. Atchley objected, as new ones coming in all the time the matter could not adjust itself, but must be done by the experienced bee-keepers discouraging the kind who won't succeed.

There were many who gave their opinions in regard to this matter. Some discouraged farm bee-keeping, while others proclaimed it all right. Some of our greatest apiarists started on the farm. But to keep bees, and a farm, too, was not deemed practicable; that either one should be followed as a profession and not divide one's attention. Either be a bee-keeper or a farmer; they can not be made to harmonize, as the bees need one's whole attention to make them successful, and either the farm or the bees must be neglected some time, especially in the spring. At the time the bees need attention the farm needs it; and as nobody can be hired to attend to a business as one himself would, something will be neglected. And what is the use of only half attending to each, instead of following the one most suitable? There are many sections most excellent for bees but not for farms; others just the reverse. Then, again, there are men more fit for one than the other. This ought to govern as to which line should be followed.

The discussion ended, that if farmer bee-keepers would keep bees in up-to-date ways, produce their honey by the latest methods, putting it up for market rightly, and keep informed in regard to the market price of honey, by reading the bee papers and books to keep up with the times, there will be no harm done. So it will be the duty of the more experienced to teach them all this. Encourage such as will succeed and will try to make a success at it. But the others that can't be taught, won't read a bee-paper, won't learn, and come in with their inferior stuff, to lump it off at any old price, should be discouraged in any way possible. Bees really belong on the farm as well as poultry, hogs, cows, and such, and should be kept, but rightly kept,

PRODUCTION OF CHUNK COMB HONEY.

This was next taken up, on which M. M. Faust gave his method of production, and disposing thereof. He wants the strongest colonies for producing all kinds of honey, but more for bulk comb honey. He lets them get strong and gives them more room, by adding half-depth supers with shallow frames containing foundation starters one-half inch wide. If the bees are slow to go up, he puts on another half-depth super, putting up some frames of brood from the brood-chamber below, and putting the shallow frames in their stead, until well started, when all is readjusted. He used to produce about one-half extracted and one-half of bulk comb, but the past season he has had to buy extracted honey to fill up his comb-honey cans. By giving all frames containing foundation he has had some trouble by the queens depositing eggs in the supers.

O. P. Hyde followed with a good paper on this same subject. In its different phases, this subject would naturally divide itself into these three parts, viz.:

1. How to produce bulk comb honey.

2. How much more bulk comb can be produced than one-pound sections?

3. Why should we produce bulk comb honey?

On the first part, have all your bees in 10-frame dovetailed hives of standard size; Italian bees, and rousing colonies. Then when the flow begins, he puts on one "Ideal" or 5 $\frac{1}{2}$ -inch-deep super with 5 $\frac{1}{8}$ -inch-deep frames filled with full sheets of extra-thin foundation. By using full sheets of this foundation the bees enter the super at once, and it will not be detected in the honey. When the first super is about half full, another is put under it, and so he keeps on tiering-up. He gives plenty of room and sometimes has as many as four or five supers on his strongest colonies.

The above size of frame is preferred, as when one is full it will just make a complete layer in the five-gallon eight-inch screw-top 60-pound cans, when cut in two in the middle. The 4 $\frac{1}{2}$ -inch frames are too shallow, requiring strips of comb to be cut to fill up the space.

The advantage of shallow frames over full-depth frames is that more capped honey can be obtained.

Secondly, he asserts that twice as much bulk-comb can be produced as one-pound sections, believing that he can prove it. The bees enter open frames more quickly, work harder, and almost fill two supers as quickly as one section super. Also, the advantage of the extra amount of extracted honey that goes in at comb-honey rate.

Thirdly, the keeping of bees from the dollar-and-cent standpoint, wanting all the honest dollars that are in it, the bee-keeper must produce the kind of honey that sells the quickest and gives the best returns. If his customers were wholly or mostly for section honey, he would be forced to produce that kind; if bulk-comb, then that kind; if extracted, then it would be extracted. As it is the demand that keeps us in the market, we must produce the kind there is a demand for.

He was once an advocate of section honey—the kind that has a thin strip of wood around it, thinking it so nice, and it could be sent to market just as the bees made it. He is still an advocate of comb honey, but the kind that is cut from the frames, placed in cans and that delicious, sweet extracted poured all over it. Then you have not only extracted on the inside, but on the outside of the comb also, which makes it more desirable to the taste. When he was for sections, the Northern brothers said he was a practical apiarist, but now he is for bulk-comb, and they say he has retrograded 30 years, which, however, does not matter with him, as he is not for popularity, but for the dollar.

He also gave some figures and some idea of the immense quantity of such bulk comb honey that is in demand over only a small amount of other kinds.

A question was asked in regard to keeping it over winter, whether it would granulate, and if it could be taken out in layers then. The answer was that this was the only drawback that bulk comb honey had, but the demand for it is so great that it can not be supplied, hence none is kept over winter to become granulated.

Mr. Davidson seriously criticized Mr. Hyde's paper, saying that he did not want it to be understood that the production of section honey should be assailed in any way, and that the production of sections should not be discouraged; besides, the production of fine section honey stands above all others, and is the highest art of producing honey. He intimated that the reason why others were not producing section honey was because they did not know how; and that the day will come when more section honey will be produced than bulk comb, as it is the more wealthy people, anyway, that eat the most honey. All three grades are good, but fine section honey can not be procured during slow flows, as it takes fast, rushing flows, and a locality with such. There is just as much in dollars and cents to be made with section honey as bulk-comb, and the former should be encouraged. O. P. Hyde ended the discussion by saying that he was not at all discouraging the production of section honey; that he is willing to produce only what is in greatest demand, and gives the greatest profits. He is not pushing this, but it is his customers that choose it, or demand it of him.

Before adjournment, H. H. Hyde moved to appoint a committee of three to judge the bee-keepers' exhibits, and these were named: D. C. Milam, W. O. Victor, and Mrs. C. R. West.

Adjourned for dinner, until 2:00 p.m.

Continued next week.

Questions and Answers.

CONDUCTED BY

DR. C. C. MILLER, Marengo, Ill.

[The Questions may be mailed to the Bee Journal office, or to Dr. Miller direct, when he will answer them here. Please do not ask the Doctor to send answers by mail.—EDITOR.]

Combs Melting Down—Swarming Mix-Up—Transferring, Etc.

Replying to J. A. Gerald's (page 567), I think he has made the right guess in concluding that the combs melted down in his hives because the dense growth surrounding them prevented the free passage of air. I never yet had combs melt down when hives stood in the full blaze of the sun, but one year I had a few cases where the hives were in dense shade all day long. A dense growth of tall corn was on one side of them, and close bushes on the other.

In reply to S. B. Smith (page 573), he has no doubt made a close guess at what transpired. Of course it can only be a guess, but I should put my full guess in this way: The young queen in No. 11 went out on her wedding-trip, accompanied by enough bees to make the small swarm that was hived; the remaining bees of No. 11 then walked over to No. 15, thus making No. 15 of extraordinary strength. An item that tends to confirm this opinion is the fact that bees were seen going on the alighting-board from No. 11 to No. 15, and it is likely that close observation would show the bees doing that same thing two weeks later. The bees on coming from the field would not go direct to No. 15, but would enter No. 11, and then crawl across until that generation died off; at least a certain number of the bees would go through that performance.

T. F. Weaver (page 574), would like to know whether his plan of transferring would work all right in a poor honey-year. It would likely be all right except the danger of robbing, for if he should do exactly as appears from his description at any time when honey was not freely coming in, he might have a lively time of it.

Dr. Peiro (page 574), lays a very heavy burden on that poor little crack under the cover. You say, Doctor, that after seeing that crack your "conclusions were clear and rapid." Rapid, very likely, but it is somewhat doubtful about the clearness. A reasonably strong colony will not only guard a full-sized entrance in the ordinary place, but also an entrance equally large right under the cover. For a number of years, following the example of Adam Grimm, I allowed, besides the regular entrance, an opening over the frames at the back end of the hive 15 inches by $\frac{1}{4}$ to $\frac{1}{8}$, and there was no trouble about the bees protecting themselves. If at a time when robbers were bad an opening should suddenly be made under the cover, there might be a little danger of trouble, but if the opening were made in a time of plenty, there should be no trouble; and there should be no danger either in scarcity or plenty if the crack were made by the gradual wearing of a cover. C. C. MILLER.

Perhaps Larvae of the Bee-Moth—Chilling Brood.

1. On Aug. 3 I made the first "drive" in transferring a colony to a new hive, supplying them with full sheets of foundation, and after they started storing well I gave them an Italian queen. I have fed them lightly by putting a small dish of granulated sugar syrup under the frames at night, and removing the empty dish in the morning. At present they have six Danz frames nearly filled, and two more started, principally from sweet clover, but they are destroying brood. In the morning there will be young bees sometimes to the number of 30 or 40 scattered around the entrance, ranging in color from clear white through all the shades and markings of brown, up to those which will be struggling to free themselves from the dewy entrance-board. What is the cause and cure?

2. Is there danger of chilling the brood by removing it from the hive in the morning or evening of cool days at this time of year?

I can find nothing on these subjects in my books.

ILLINOIS.

ANSWERS.—1. Looks like worms, or (begging Prof. Cook's pardon) the larva of the bee-moth. They work

their galleries through the cappings, and the larva of one kind work at the bottom of the cell. When very bad, the young bees will be dragged out as you describe. The remedy is to get Italian blood. Possibly, however, a fuller knowledge of the case might suggest some other trouble.

2. No danger when it is warm enough for bees to fly, unless the brood is kept out an unreasonable length of time. Ordinarily there is no need to have a frame of brood in the hands more than a minute at a time.

* The Afterthought. *

The "Old Reliable" seen through New and Unreliable Glasses.
By E. E. HASTY, Sta. B Rural, Toledo, O.

NO BROOD BUT EGGS PRESENT DURING DROUTH.

Dr. Miller's experience in the great July drouth—no brood either sealed or unsealed, but *eggs always present*—adds a crumb to a pertinent and interesting bee-fact which we have to figure with. Page 519.

PURITY IN MARKINGS OF PARENTS.

It sounds to me as if "Texas," on page 520, was after strictly three-banded queens and drones. Won't get em. Doubtful if they could be called any purer than the present ones if he did. He should remember that nature often differentiates the sexes remarkably. Sometimes it even occurs that the male is a winged creature and the female a crawling worm. Wild birds are pure, yet often the male is brilliant in colors while the female is plain looking.

"BURNING ONE'S OWN SMOKE."

Prof. Cook, on page 521, passes to us some important teaching clad in very pungent words—let us burn all our own smoke. Won't make quite so much smoke if we have the job of burning it in view. And what rent have we paid for our neighbor's eyes and lungs that we should warehouse our smoke in them? Ahem! not forgetting that what we try to call entertaining conversation is sometimes the worst smoke we make.

MAKING ROOMS MOUSE-PROOF.

Mr. Foote is on the right track about mouse-proof rooms. Nice first get into the spaces between walls. From that vantage ground they see the Promised Land through cracks, and lay plans to get there—would not so often dodge through doors had they not their minds made up previously that it was a good place to go. And usually, as we know, some little defect in plaster or base-board proves capable of enlargement, and in they come. Flooring plump to the outside of the building, and studs set on a narrow plank, would keep them out of the wall-spaces to start with, and so mainly prevent after consequences. Page 523.

WORKING HIS "STANDS."

How does he work his stands, Dear Boss? Why, he makes them *lift*. And if he makes them lift about 100 pounds more in August than they do in May, is it not all right? Virgil is praised because he called a bee-hive twelve different names; and ever since I read Virgil (if not before) I have had a leaning in that direction—toward an elastic application of terms. True, lack of precision is a bad thing; but it is also a bad thing to have our vocabulary too limited—too lean and bald. May we not all be poets to the small extent of having a little versatility to our speech? Let us not groan nor scold even if one comrade does catch a nice *string* while another catches a nice lot of fish—and another catches a dinner, and another catches a cure for sore eyes. Page 530.

THE LEGISLATION OF THE AUSTRALIANS.

Those Australians are continually solving things the rest of the world failed to solve—or failed to try to solve. We cannot very well legislate the apiarian pig to his own end of the territory trough; but we can give him a "bar-sinister" by refusing him membership—and see whether his hide is so tough that he cares nothing for a blow of that kind. Alas, American societies seem rather too nebulous to hit anybody, even to the small extent of refusing membership. Membership is anybody that happens to come to a meeting—and so few that the proposition to bar people out would seem gro-

tesque—last rose of summer forbidding the pips to bloom. Page 527.

WRITING UP THINGS WHILE FRESH IN MIND.

I also incline to "Amen" the plan of writing up things while they are fresh in the mind. Writer needs the help most even if it was a case of writer versus reader, which it isn't exactly. Reader's ears have been dug open by his experiences, and will have wax in them ten months hence. Also, if the would-be writer forgets a thing before it gets in print there is no back number to go to for it. Page 531.

* The Home Circle. *

Conducted by Prof. A. J. Cook, Claremont, Calif.

THE TABLE.

"Ah! but wasn't that an elegant table?" That was my daughter's query. We had just broken doughnuts with a good friend—one of those splendid women who is ever dispensing cheer and comfort. And well did she ask. First, the linen was so entirely immaculate and of such proportions that it just seemed made for that special table. Each marginal inch seemed impressed by gravity just as strongly as every other, for none had reached down nearer the floor than had any other. And the table *per se*—what a piece of art! The plates with accompaniments, each was like a well arranged bouquet. Nothing was crowded, yet there was no wide desert area, and we were all glad that room was found for a single lovely spray of wild roses. These were sweet as they were chaste and beautiful. The whole combination was so pleasing to the eye, that one could be content to sit and gaze.

Of course we all like good things to eat. We do all appreciate as we may, and ought, the utility of beauty about and on the table?

I know a dear old farmer who would never sit at the table, nor would any of the children, without collar, clean coat and necktie. The children grew up simply to respect and copy that parent. The mother rarely omitted the flowers. She appreciated the courtesy of the loving, thoughtful husband. Flowers of discord could never grow about that table. Other better flowers had preoccupied the territory.

Do we all know and realize what a prominent part appearance—involving vials—play in the work of digestion? Let the table look well, the eatables offered savory, so that one loves to sit and linger, because, simply, of the environs, and the digestive organism laughs at its work, and feels it no burden. Ought we not to make the dining-room the very pleasantest in the home? There we are all together. There we sit long most of us ought to sit much longer. For reasons of health. I would have the room, the table, the good things on it, the very atmosphere, all as elegant and delightful as time and means would permit. We can none of us afford ever to be cross, surly, petulant—certainly not in the home, assuredly not at the dear home table. There is no lubricant that so nicely oils the wheels of digestion and assimilation as does good cheer. Nothing so adorns the home table like never-failing courtesy, cheerful demeanor, sweetest temper. It is an undoubted fact that nothing breeds incurable dyspepsia like crabbedness. Nothing shuts it out from the home and life more surely than an atmosphere of pinkest love and harmony.

GATHERING AT THE MEAL.

A day or two since, I was entertained at two of the most lovely rural homes in California. That is saying much, for no urban homes can surpass in comfort and elegance some of the ranch homes of this favored region. At one I was only present at the dinner hour. It was a family which sounded no discord in that lovely home. As we gathered, all were present and sat at once. It was easy to see that this was their wont. Only well-drilled soldiers are always in line. One can see so quickly in the preparation for meals whether they are in habit of union, or whether they struggle along, with no thought of one another.

In the other home, equally elegant, it was not so. I was present at two meals, and at both each came as convenience set the pace. It was obvious that this was custom. I sorrowed for all. In my home, and at my table, I would as soon

the steak, the coffee, or the bread, were omitted as to be deprived of son or daughter, and the whole table would in no wise compensate for the absent, or lack of the good wife.

REGULARITY.

This gathering at the table marks one phase of life that counts for much in our success or failure. Are we regular in our habits? Do we accustom ourselves to act promptly, and on time? Even in our physical functions this contributes immensely towards health and vigor. In the mental activities it means much more fruitage. To rise, to eat, to retire, etc., at irregular times, means enfeebled health and poor work. To study haphazard, means poor mental work, and a shabby brain. This is one of the good things about college life. There lunch must be exactly on time. Often this will suggest and secure regularity in all the life. Then organic wheels all turn easily—no friction anywhere. Each organ does its best, and most, and all the time. We know not why, but the body works much more energetically when it is always in its special grooves. I think most of the great geniuses have had habits of wonderful regularity. Men like Gladstone could not have so moved the world had any other course been chosen.

CARPENTERIA.

The ride on the "Espe" shore line from Ventura to Santa Barbara is charming. I took it to-night by moonlight. On one side the tall hills—beginnings of the Sierra Madre—bug close as if to shut all danger away. On the other, the breakers keep pushing up as if to hold us on the narrow rock ledge. With the moonlight to gild all, it seems a fairy scene. Carpenteria—pronounced Car-pen-te-ree-a—is a delightful little burg about midway on this line. The word is said to come from the Spanish for "carpenter." There are several explanations for its adoption. I like this one: The red-winged flicker or yellow-hammer like the golden-winged of the East, except red replaces gold on the wing-feathers, is thick here, and is a winged carpenter, as all over California it pecks into buildings. One church is surely very "holey" because of this bird's desire of entrance.

If we can trust to appearances at Carpenteria the bird is a Baptist. The worshippers there have been compelled to tin the church steeple, to protect from the flickers. The bird is also a sap-sucker in California. He taps the walnuts, as does the real, genuine sap-suckers the various orchard and forest trees here and elsewhere. He is also unlike his close relative East—a fruit lover. No wonder any bird that once tasted California fruits would surely change its food habits, and become frugivorous on the spot.

Like the other flicker, if we take this bird's eggs away daily, she will lay as many as 30.

SICK PLANTS.

Do our plants talk to us? If not, let us get acquainted with them, and then they will. I love the poet Bryant. Isn't he called "the Poet of Nature?" He loved the great, spreading trees, with their grace and grateful shade. The brooks sang for him, and to him; and trees, brooks, hills, mountains, sky and air, had their stories to which his ears gave fine attention. He wrote the great "Thanatopsis." I read it so much to my children, that they learned the poem, and to-day my daughter loves Bryant most of all our poets. That he had a listening ear for Nature's finest thoughts appears from the exordium of that masterpiece:

"To him who in the love of Nature holds communion with her forms,
She speaks a various language."

The little child wakes before the day, and awakens our keenest anxieties by his little "I'm sick." As Day draws her curtains, we peer down to the little trundle-bed, and we see the pallor that drove away the pink and the rose, and the "I'm sick" is spoken just as clearly.

My wife is anxious. The great, splendid sword-fern which is the glory of our parlor, tells her it is sick. It speaks in the yellowing tint of the leaves. And what shall we do? As in all plant sickness, so now. First, are there any insects? Does grub or caterpillar sap the roots, or scale or aphid the leaves? My wife is too wary to make that probable. We examine very carefully and find nothing.

Next the water. Has there been too little or too much? Wife has learned to guage the water. We decide the water has been right.

Then we add nitrogen, sodium nitrate or Chili saltpeter is excellent, and, all at once, as by magic, new green appears, life brightens, and our plant fairly sings, "I'm well again!"

Plants, like children, must be generously fed.

Standard Belgian Hare Book!

BY M. D. CAPPS.
THIS book of 175 pages presents a clear and concise treatment of the Belgian Hare industry; its growth, origin and kinds; the sanitation and construction of the rabbitry; selection of breeding stock; care of the young, feeding, diseases and their cures, scoring, marketing, shipping, &c. First edition of 50,000 copies was sold in advance of publication.

Price, in handsome paper cover, 25 cents, post paid; or with the American Bee Journal one year—both for only \$1.10.

GENERAL ITEMS

Bees Did Well.

My bees have done very well this season, and not much warning. From one colony I took 228 filled sections of honey. We get very little dark honey.

JOHN GERTHOFFER.

Ononolaga Co., N. Y., Sept. 9.

From Two Washington Girls.

We have done so well in the bee-business this summer that we thought we would write again. We are going to send a picture of our apiary this fall.

By buying queens and comb foundation we increased from 7 colonies to 21. They have filled 350 sections. We ran out of sections, and so we put on empty supers and boxes. They have them nearly full of honey now. We get 16 cents per section, and could sell all we could produce at that price, even if we had 100 colonies, and that is what we are going to have before we quit. We wish you could see some of our honey. It is white, and of the finest quality.

EDNA AND ALICE YOUNT.

Spokane Co., Wash., Aug. 31.

The "Jouncer"—Queen-Excluders.

Permit me to join Mr. Davenport in commending Mr. Martin's "jouncer." Noticing reference to it in a recent number of the American Bee Journal, I thought it worth a trial in removing bees from cases of comb honey. The first attempt was so satisfactory that I thought aloud that "that little bit of information was worth several years' subscription to the American Bee Journal, to any bee-keeper whose time is of value." It does not need a heavy jar, but a quick, sharp one, such as may be given by a little practice.

If Mr. Martin's cloth tray could be placed so as to be joined with the super or case, it seems to me that there would be practically no killing of bees. I use a little smoke before removing the case from the hive; a little

He has but to give them a small amount of attention, and at the proper time take what they have stored up for his well-being. It is an industry that needs to be understood in order that the prejudice in the minds of those who are ready to exclaim, "How hot its little feet are, begorrah!" be removed. There is no more interesting study than one may find right in this industry. With the present improved methods of bee-keeping, the highly heated "pedal extremities" need not inconvenience any one.

There is in this land of fruit and flowers—this land of fair climate—a large future for the bee. It should be the very paradise (as it is hoped it may be) of the bee. It will also be a great help to the debt-burdened, hard-working farmer.

"RANCHER,"
California, Aug. 5.

Something from Arkansas.

I have been a subscriber of the American Bee Journal for nearly a year, and am indeed impressed with the fact that it is peculiarly in the interest of the apiarist.

While Arkansas may not be as good a bee-State as some others, yet with the proper care and interest in the work, honey can be relied upon as an industry sufficiently paying to encourage any one to embark in the business here.

The moth seems to be the pest to the apiaries of Arkansas, as is also the borer to the orchard. Part of my hives are the old-fashioned box-hive, and part are movable-frame hives, mostly the old "Kiddier" hive; both do well, but I have no doubt that the frame hive is much the better. However, many people who have tried the frame hives on a small scale, have gone back to the box-hive again, declaring the former to be a failure. This, of course, is because they gave their bees no attention.

This is purely a cotton country, and but little attention is paid to any other industry. I have for several years been studying and reading about the bee, and intend to join the National Bee-Keepers' Association, and hope to be of some use to the bee-industry of this country.

Yell Co., Ark., Aug. 31.

A. E. STONE.

Treating Hive-Covers—Other Matters.

Mr. E. H. Schaeffle, in Gleanings in Bee-Culture, proposes to paint hive-covers in linseed oil to prevent warping. This may be a very good way for water-tight hives. My way has been to paint hives and covers inside with raw linseed oil. Oil makes it easy to scrape and clean hives out, as well as to protect the wood. For the outside, two coats of pure white lead mixed with raw linseed oil. White lead is a cool paint. I have some red-wood hives ten years old thus treated, that are almost as good as new, while hives that were not painted have mostly gone to wreck.

But nothing suits me like the doveetailed hive and gable cover for moving, as well as for the dry climate of central and southern California.

For bad cases of robbing I use the following plan: Remove the covers of the hives being robbed, and put on an empty frame covered with wire-cloth, such as is used in moving bees. Then brush a little coal-oil on the entrance, and a large part of the robbers will be attracted to the top of the hive. This also affords the little "soldiers" air.

The honey-flow from the lima beans of Ventura county has been very light—only enough to put the bees in good condition for winter. We moved 200 colonies 50 miles for the beans, at the close of sage-hloom.

The honey crop near Newhall was a good average one, but not so close to the coast, as a cool fog lasted while the sage was in bloom. I was told that San Diego county would not have honey enough for its own use.

E. ARCHIBALD.

BEE-BOOKS

SENT POSTPAID BY

George W. York & Co.

Chicago.

Bees and Honey, or Management of an Apiary for Pleasure and Profit, by Thomas G. Newman.—It is nicely illustrated, contains 160 pages, beautifully printed in the highest style of the art, and bound in cloth, gold-lettered. Price, in cloth, 75 cents; in paper, 50 cents.

Langstroth on the Honey-Bee, revised by Dadant.—This classic in bee-culture has been entirely re-written, and is fully illustrated. It contains of everything relating to bees and bee-keeping. No apiarian library is complete without this standard work by Rev. L. L. Langstroth, the Father of American Bee-Culture. It has 520 pages, bound in cloth. Price, \$1.25.

Bee-Keepers' Guide, or Manual of the Apiary, by Prof. A. J. Cook, of the Michigan Agricultural College.—This book is not only instructive and helpful as a guide in bee-keeping, but is interesting and thoroughly practical and scientific. It contains a full delineation of the anatomy and physiology of bees. 460 pages, bound in cloth and fully illustrated. Price, \$1.25.

Scientific Queen-Rearing, as Practically Applied, by G. M. Doolittle.—A method by which the very best of queenbees are reared in perfect accord with Nature's way. Bound in cloth and illustrated. Price, \$1.00.

A B C of Bee-Culture, by A. I. Root.—A cyclopedia of 400 pages, describing everything pertaining to the care of the honey-bees. Contains 240 engravings. It was written especially for beginners. Bound in cloth. Price, \$1.20.

Advanced Bee-Culture, Its Methods and Management, by W. Z. Hutchinson.—The author of this work is a practical and entertaining writer. You should read his book; 90 pages, bound in paper, and illustrated. Price, 50 cents.

Rational Bee-Keeping, by Dr. John Dzierzon.—This is a translation of his latest German book on bee-culture. It has 350 pages, bound in paper covers, \$1.00.

Bienen-Kultur, by Theos. G. Newman.—This is a German translation of the principal portion of the book called "Bees and Honey." 100-page pamphlet. Price, 25 cents.

Bienenzucht und Honiggewinnung, nach der neuesten methode (German) by J. F. Eggers.—This book gives the latest and most approved methods of bee-keeping in an easy, comprehensible style, with illustrations to suit the subject. 50 pages, board cover. Price, 50 cents.

Bee-Keeping for Beginners, by Dr. J. P. H. Brown, of Georgia.—A practical and condensed treatise on the honey-bee, giving the best modes of management in order to secure the most profit. 10 pages, bound in paper.

Bee-Keeping for Profit, by Dr. G. L. Tinker.—Revised and enlarged. It details the author's "new system, or how to get the largest yields of comb or extracted honey." 80 pages, illustrated. Price, 25 cents.

Apiary Register, by Thomas G. Newman.—Devotes two pages to colony. Leather binding. Price, for 50 colonies, \$1.00; for 100 colonies, \$1.25.

Dr. Howard's Book on Foul Brood.—Gives the McEvoy Treatment and reviews the experiments of others. Price, 25 cents.

Winter Problem in Bee-Keeping, by G. R. Pierce.—Result of 25 years' experience. 20 cts.

Foul Brood Treatment, by Prof. F. R. Cheshire.—Its Cause and Prevention. Price, 10 cts.

Foul Brood, by A. R. Kohoke.—Origin, Development and Cure. Price, 10 cents.

Capons and Caponizing, by Dr. Sawyer, Fanny Field, and others.—Illustrated. All about caponizing fowls, and thus how to make the most money in poultry-raising. 64 pages. Price, 20c.

Our Poultry Doctor, or Health in the Poultry Yard and How to Cure Sick Fowls, by Fanny Field.—Everything about Poultry Diseases and their Cure. 64 pages. Price, 20 cents.

Poultry for Market and Poultry for Profit, by Fanny Field.—Tells everything about Poultry Business. 64 pages. Price, 20 cents.

POULTRY PAPER.

Send 25 cents for a year's subscription to our Journal, and we will send you Poultry Plans for Poultry Houses, free, six months trial subscription to Journal, 10 cents.

Size of Queen-Rearing Nuclei.

Efforts have been made to use as small a number of bees as possible in queen-rearing nuclei from the time the young queen emerges until she is laying, but it is possible the waste of a larger number of bees is not so great as might be supposed. Dr. Miller says in *Gleanings in Bee-Culture*:

The greatest part of the cost of rearing a queen has been considered the time occupied in the nucleus to get her to laying; and, like others, I have made some effort toward seeing how few bees might be successfully used in a nucleus. But is not the cost of nuclei magnified? If I am not mistaken, a colony with a virgin queen will work just as vigorously as one with a laying queen, and a field-bee will carry just as much nectar to a nucleus as to a full colony. If that is correct, and if a cell is given at the time of removing a laying queen from a nucleus, then there will not be more than two days when the nucleus will not be in good storing condition, and when too much honey is in a nucleus a full frame can be exchanged for an empty one. Of course there will be some loss from the larger proportion of bees required to keep up the heat in a small nucleus. But I suspect that the gain from fewer bees in a nucleus is overrated.

To Prevent Swarming.

Mr. Doolittle says in *Gleanings in Bee-Culture* he is trying several plans, but has only one which is as yet perfect enough to give out. It is as follows:

Give lots of room, with as many bait-cesses as possible, so as to discourage early swarming as much as you can. When you think you can hold them from swarming no longer, cage the queen. Now wait from 10 to 11 days, when you will shake the bees off their combs so you are sure to see every queen-cell started, and pull every cell off. Now make a hollow plug to fit one end of the cage the queen is in, and fill the hollow with candy, such as is used in shipping queens, having the plug about 1½ inches long, so the bees will be about two days in eating out the candy, and liberating the queen. Thus doing away with all desire for swarming from that colony.

Feeding Medicated Syrup to Bees.

It is time to feed bees in the central and northern States; and if feeding has to be resorted to I would strongly urge medicating all the syrup with the naphthol-beta solution. Such a precaution becomes exceedingly necessary just now when foul and black brood have been extending their ravages in every direction. The medicated syrup will not kill the spores of either disease, but it will destroy the bacilli as soon as the spores develop into the active stage.

Into an eight-ounce bottle (half pint) empty a one-ounce package of naphthol-beta in the form of a fine white powder. Pour in just enough wood or common alcohol to dissolve the powder, and fill the bottle full. This quantity of chemical in solution is just right for 140 pounds of sugar dissolved in 140 pounds of water. To mix, put 140 pounds of water in a common honey-extractor; then add sugar gradually, dipperful by dipperful, until there are about 140 pounds of sugar. While the sugar is being added, keep turning the handle of the extractor so the mix will be rapid agitation and thorough mixing. After the sugar is all in, keep on turning the handle until it is all dissolved, and, last of all, pour in the naphthol-beta solution already referred to. Stir this into the mixture thoroughly by running the extractor for several minutes longer.

In handling the naphthol-beta solution, be

Langstroth on... The Honey-Bee

Revised by Dadant—1900 Edition.

This is one of the standard books on bee-culture, and ought to be in the library of every bee-keeper. It is bound substantially in cloth, and contains over 500 pages, being revised by those large, practical bee-keepers, so well-known to all the readers of the *American Bee Journal*—Chas. Dadant & Son.

Each subject is clearly and thoroughly explained, so that by following the instructions of this book one cannot fail to be wonderfully helped on the way to success with bees.

The book we mail for \$1.25, or club with the *American Bee Journal* for one year—both for \$1.75; or, we will mail it as a premium for sending us **THREE NEW** subscribers to the *Bee Journal* for one year, with \$3.00.

This is a splendid chance to get a grand bee-book for a very little money or work.

39A2b R. R. No. 1, BASSARD, Wis.
Please mention Bee Journal when writing.

careful not to get it on the fingers; but after it is mixed with the syrup, it is perfectly harmless to man or bees. Naphthol-beta can be obtained for 25 cents an ounce; and at this low price no bee-keeper can afford not to take the precaution.

In making the syrup we recommend half sugar and half cold water. There is no need of heating, provided thorough stirring is used, either with a stick and tub, or, better still, in an extractor in the manner explained. We have fed a half-and-half mixture for several years; and since using it we have never had any trouble from its going back to sugar in the cells after the bees have put it into the comb. For very late feeding it may be advisable to use one part of water and two of sugar.—Gleanings in Bee-Culture.

Honey-Cakes.

It seems a good thing that fashion magazines of wide circulation should help to increase the use of honey. The following recipe is from the Delineator:

Mix thoroughly one quart of honey, 1 pound pulverized sugar, 1 pound fresh butter, juice of 2 oranges; then stir in gradually enough sifted flour to make a dough stiff enough to roll out easily. Turn out on a molding-board; beat well for a few minutes with a rolling-pin; then roll out into sheets half an inch thick; cut into round cakes, and bake in shallow buttered pans.

CONVENTION NOTICES.

Illinois.—The annual meeting of the Northern Illinois Bee-Keepers' Association will be held in the Court House in Rockford, Ill., on Tuesday and Wednesday, Oct. 15 and 16, 1901. All interested in bees are invited to attend.
Rockford, Ill. B. KENNEDY, Sec.

Utah.—There will be a meeting of the Utah Bee-Keepers' Association in the City and County Building, Salt Lake City, Utah, Oct. 5, 1901, at 10 a. m., to which all are cordially invited. Kindly inform other beekeepers and send the addresses of your neighbor beekeepers. We also desire the address of all county bee-inspectors. A full program in the interest of the industry will be presented. Send in questions. Among other questions it is desired to consider, is a union of interest in the purchase of supplies and the disposing of bee-products at profitable rates. Yours in behalf of the beekeepers,
E. S. LOVENS, Pres., J. B. FAGG, Sec.,
Salt Lake City, East Mill Creek.

100 Full Swarms With good laying Bees at \$1.25 bees in shipping-box, no hive or comb; hire extra, \$1.00. HONEY AND BEESWAX

MARKET QUOTATIONS.

CHICAGO, Sept. 19.—No. 1 white comb honey is selling at 15c per pound, with occasionally a little more being obtained for fancy, that which does not grade No. 1 selling at from 13c to 14c, with the 13th about 13c; dark honey of various kinds selling at 10c to 11c. Extracted in moderate demand at from 5 1/2c to 6c for the various grades of white; some fancy white clover and hawthorn bringing 7c; light amber ranging from 5 1/2c to 6c; dark at 15c to 16c. Beeswax firm at 28c to 30c.
R. A. BURNETT & CO.

CINCINNATI, Aug. 10.—The honey market is rather dull on account of the warm weather. Extracted sells only to manufacturers at 50c; better grades alfalfa water-white from 60c to 7c; white clover from 65c to 7c. Fancy white comb honey sells from 13 1/2c to 15c.
C. H. W. WEBER.

BOSTON, Sept. 14.—Honey is coming forward in fair quantities and the demand is good, considering the warm weather we are having. Strictly fancy in cartons we quote at 10c; A No. 1, 15c; No. 1, 14c to 15c. Very little No. 2 being received.
BLAKE, SCOTT & LEE.

ALBANY, N. Y., Sept. 19.—We quote: Fancy white comb, 16c; No. 1, 15c; mixed, 13c to 14c; No. 1 buckwheat or amber, 12c to 13c. Extracted, white, 7c to 7 1/2c; light, 6 1/2c to 7c; dark, 5 1/2c to 6c. Beeswax, 28c to 29c.
H. R. WRIGHT.

OMAHA, Aug. 8.—New comb honey is arriving by express in small quantities from Iowa and Colorado, and selling at \$3.50 per case in a retail way. California extracted honey is being offered at 4 1/2c to 5c per pound, and California shipping-points, but we have not heard of any sales having been made thus far. The production of extracted honey seems to be quite large this year in Colorado, Utah and California.
PEYCKE BROS.

NEW YORK, Sept. 10.—Comb honey is now beginning to arrive in large quantities, and, as a rule, quality is fine. The demand is good, and we quote as follows: Fancy white, 14c to 15c; No. 1, 13c to 14c; No. 2, 12c to 13c. Light amber, 11c to 12c. Wheat is on the market as yet, but are expecting same within a week or so. Extracted is selling slowly, with plenty of supply, at 5 1/2c to 6c, according to quality, and Southern in barrels at from 5 1/2c to 6c per case. Beeswax dull at 27c.
HILDEBETH & SKEELKEN.

DES MOINES, Aug. 7.—There is very little doing here in new crop of honey. Some small lots of near-by produced comb honey are on the market and selling in a retail way at \$3.50 to \$3.75 per case. We do not look for much trade in this line before Sept. 1. Our market does not consume a great deal of extracted honey.
PEYCKE BROS. & CHANEY.

DETROIT, Aug. 12.—Fancy white comb honey, 14c to 15c; No. 1, 13c to 14c; no dark to quote. Extracted, white, 6c to 7c. Beeswax, 26c to 28c.
M. H. HUNT & SON.

BUFFALO, Aug. 10.—Quite a good demand for fancy honey, 16c to 17c, and lower grades, 12c to 14c; old neglected. Advise moderate shipments only of new as yet.
BATTERSON & CO.

SAN FRANCISCO, Sept. 4.—White comb, 10c to 12c; amber, 7c to 8c; dark, 6c to 7c; Extracted, white, 4c to 5c; light amber, 4 1/2c to 5c; amber, 4c to 5c. Beeswax, 26c to 28c.

Arrivals and spot offerings are of rather moderate volume, but there is as much or more on market than can be conveniently or advantageously placed. To secure liberal wholesale custom, prices would have to be shaded in favor of buyers. To a small way for especially desirable lots slightly higher figures than are quoted are realized.

KANSAS CITY, Sept. 14.—Up to the present time only small lots of new comb honey have been on the market, and these are in small sale on the basis of 15c to 16c per pound for fancy white. For next week heavier receipts are expected and quotations are issued at \$3.10 to \$3.25 per case for large lots, which would be equal to about 13c to 14c; the demand being quite brisk, a firm market is anticipated. Inquiries for extracted are a little more numerous, but large buyers still seem to have their ideas too low. In a small way \$4 1/2c is quotable.

—THE—

Bee-Keeper's Guide

Or, Manual of the Apiary.

—BY—

PROF. A. J. COOK.

460 Pages—16th (1899) Edition—18th Thou-
sand—\$1.25 postpaid.

A description of the book here is quite unnecessary—it is simply the most complete scientific
and practical bee-book published to-day. Fully
illustrated, and all written in the most fascinat-
ing style. The author is also too well-known to
the whole bee-world to require any introduction.
No bee-keeper is fully equipped, or his library
complete, without THE BEE-KEEPER'S GUIDE.

This 16th and latest edition of Prof. Cook's
magnificent book of 460 pages, in neat and sub-
stantial cloth binding, we propose to GIVE away
to our present subscribers, for the work of getting
NEW subscribers for the American Bee
Journal.

Given for TWO New Subscribers.

The following offer is made to PRESENT sub-
scribers only, and no premium is also given to
the two NEW subscribers—simply the Bee Jour-
nal for one year:

Send as TWO NEW SUBSCRIBERS to the Bee
Journal (with \$2.00), and we will mail you a copy
of Prof. Cook's book FREE as a premium.
Prof. Cook's book alone sent for \$1.25, or we club
it with the Bee Journal for a year—both for only
\$1.75. But surely anybody can get only TWO
NEW SUBSCRIBERS to the Bee Journal for a year,
and thus get the book as a premium. Let every
body try for it. Will YOU have one?

RED CLOVER QUEENS

BLACK ROCK, N. Y., Sept. 3, 1901.

FRIEND ERNEST:—I will try and tell you what you want to know about that queen. I got
her of you in 1899 as a premium with GLEANINGS. I never saw a small colony of bees build up
as that one did. In the spring of 1900 they came out in fine shape, wintered perfect. I raised them
up in May and gave them 8 frames more so the queen would not want for room. I never saw such
a colony of bees as they were in June, and they were actually storing honey when other bees in
my yard were starving. No! they were not robbing. I never saw those two best colonies of mine
trying to rob. THEY CERTAINLY WORK ON RED CLOVER. This is no guesswork, as I
have seen them. As you know, the past two seasons have been very poor, and what honey my
bees did get in 1900 candied soon after cold weather set in. I packed this colony in a chaff hive
and left them out, thinking that such a strong colony would winter perfect. The snow came on
the middle of November, and those poor bees never a fly until the last of March or the first of
April. When warm weather at last came I thought they were dead, as they did not seem to be fly-
ing much, so I did not pay any attention to them until in June. I noticed they were working a
little, so I opened up the hive and found them in the upper story. I took the lower story out and
left them in the one body. The queen was laying nicely, and I thought they would make a good
colony to winter. Along the last of July I noticed that they needed more room. I gave them a
super, 24 boxes, and in a few days they had it full. They have made 72 boxes of as nice honey as
you ever saw, and are drawing out some starters now, Sept. 2.

Very truly yours,

GEO. B. HOWE.

Prices of Red Clover Queens.

Gleanings in Bee-Culture 1 year and Untested Queen.....	\$2.00
Untested Queen.....	4.00
Tested Queen.....	4.00
Select Tested Queen.....	6.00

If you want something good you can not do better than to order one of these queens. All or-
ders are filled promptly. No extra postage on these to foreign countries.

AMERICAN

BEE JOURNAL

GEORGE W. YORK,
Editor.

CHICAGO, ILL., OCTOBER 3, 1901.

FORTY-FIRST YEAR
No. 40.

WEEKLY

APIARY OF LESLIE E. HAZEN.—(See page 628.)

F. J. DOWLING, PHILA.

PUBLISHED WEEKLY BY

GEORGE W. YORK & COMPANY

144 & 146 Erie St., Chicago, Ill.

Entered at the Post-Office at Chicago as Second-Class Mail-Matter.

EDITORIAL STAFF.

GEORGE W. YORK, Editor-in-Chief.

DR. C. C. MILLER, Department
E. E. HASTY, Editors.
PROF. A. J. COOK,

IMPORTANT NOTICES.

The Subscription Price of this Journal is \$1.00 a year, in the United States, Canada, and Mexico; all other countries in the Postal Union, 50 cents a year extra for postage. Sample copy free.

The Wrapper-Label Date of this paper indicates the end of the month to which your subscription is paid. For instance, "dec'1" on your label shows that it is paid to the end of December, 1901.

Subscription Receipts.—We do not send a receipt for money sent us to pay subscription, but change the date on your wrapper-label, which shows you that the money has been received and duly credited.

Advertising Rates will be given upon application.

National Bee-Keepers' Association

OBJECTS:

- To promote and protect the interests of its members.
- To prevent the adulteration of honey.
- To prosecute dishonest honey-dealers.

DR. A. B. MASON, Secretary, Toledo, Ohio.

EGENE SECOR, General Manager and Treasurer, Forest City, Iowa.

MEMBERSHIP DUES, \$1.00 a year.

☞ If more convenient, Dues may be sent to the office of the American Bee Journal, when they will be forwarded to Mr. Secor, who will mail individual receipts.

A Celluloid Queen-Button is a very pretty thing for a bee-keeper or honey-seller to wear on his coat-lapel. It often serves to introduce the subject of honey, and frequently leads to a sale.

NOTE.—One reader writes: "I have every reason to believe that it would be a very good idea for every bee-keeper to wear one [of the buttons] as it will cause people to ask questions about the busy bee, and many a conversation thus started would wind up with the sale of more or less honey; at any rate it would give the bee-keeper a superior opportunity to enlighten many a person in regard to honey and bees."

The picture shown herewith is a reproduction of a motto queen-button that we are furnishing to bee-keepers. It has a pin on the underside to fasten it.

Prior, by mail, 6 cents; two for 10 cents; or 6 for 25 cents. Send all orders to the office of the American Bee Journal.

Langstroth on... The Honey-Bee

Revised by Dadant—1900 Edition.

This is one of the standard books on bee-culture, and ought to be in the library of every bee-keeper. It is bound substantially in cloth, and contains over 500 pages, being revised by those large, practical bee-keepers, so well-known to all the readers of the American Bee Journal—Chas. Dadant & Son. Each subject is clearly and thoroly explained, so that by following the instructions of this book one cannot fail to be wonderfully helped on the way to success with bees.

The book we mail for \$1.25, or club it with the American Bee Journal for one year—both for \$1.75; or, we will mail it as a premium for sending us **THREE NEW** subscribers to the Bee Journal for one year, with \$3.00.

This is a splendid chance to get a grand bee-book for a very little money or work.

GEORGE W. YORK & CO.

144 & 146 Erie Street, CHICAGO, ILL.

—THE— The Bee-Keeper's Guide;

Or, Manual of the Apiary,

—BY—

PROF. A. J. COOK.

460 Pages—16th (1899) Edition—18th Thousand—\$1.25 postpaid.

A description of the book here is quite unnecessary—it is simply the most complete scientific and practical bee-book published to-day. Fully illustrated, and all written in the most fascinating style. The author is also too well-known to the whole bee-world to require any introduction. No bee-keeper is fully equipped, or his library complete, without **THE BEE-KEEPER'S GUIDE**.

This 16th and latest edition of Prof. Cook's magnificent book of 460 pages, in neat and substantial cloth binding, we propose to **GIVE AWAY** to our present subscribers, for the work of getting **NEW** subscribers for the American Bee Journal.

Given for TWO New Subscribers.

The following offer is made to **PRESENT** subscribers only, and no premium is also given to the two new subscribers—simply the Bee Journal for one year:

Send us **TWO NEW SUBSCRIBERS** to the Bee Journal (with \$2.00), and we will mail you a copy of Prof. Cook's book **FREE** as a premium. Prof. Cook's book alone sent for \$1.25, or we club it with the Bee Journal for a year—both for only \$1.75. But surely anybody can get only **TWO NEW SUBSCRIBERS** to the Bee Journal for a year, and thus get the book as a premium. Let every body try it. Will YOU have one?

GEORGE W. YORK & CO.,

144 & 146 Erie Street, CHICAGO, ILL.

The Novelty Pocket-Knife.

Your Name and Address on one side—Three Bees on the other side.

(THIS CUT IS THE FULL SIZE OF THE KNIFE.)

Your Name on the Knife.—When ordering, be sure to say just what name and address you wish put on the Knife.

The Novelty Knife is indeed a novelty. The novelty lies in the handle. It is made beautifully of indestructible celluloid, which is as transparent as glass. Underneath the celluloid, on one side of the handle is placed the name and residence of the subscriber, and on the other side pictures of a Queen, Drone, and Worker, as shown here.

The Material entering into this celebrated knife is of the very best quality; the blades are hand-forged out of the very finest English razor-steel, and we warrant every blade. The bolsters are made of German silver, and will never rust or corrode. The rivets are hardened German silver wire; the linings are plate brass; the back springs of Sheffield spring-steel, and the finish of the handle as described above. It will last a lifetime, with proper usage.

Why Own the Novelty Knife? In case a good knife is lost, the chances are the owner will never recover it; but if the "Novelty" is lost, having name and address of owner, the finder will return it; otherwise to try to destroy the name and address, would destroy the knife. If traveling, and you meet with a serious accident, and are so fortunate as to have one of the "Novelties," your POCKET KNIFE will serve as an identifier; and in case of death, your relatives will at once be notified of the accident.

How appropriate this knife is for a present! What more lasting memento could a mother give to a son, a wife to a husband, a sister to a brother, or a lady to a gentleman, the knife having the name of the recipient on one side?

The accompanying cut gives a faint idea, but cannot fully convey an exact representation of this beautiful knife, as the "Novelty" must be seen to be appreciated.

How to Get this Valuable Knife.—We send it postpaid for \$1.25, or give it as a Premium to the one sending us **THREE NEW SUBSCRIBERS** to the Bee Journal (with \$3.00). We will club the Novelty Knife and the Bee Journal for one year, both for \$1.90.

GEORGE W. YORK & CO.

St., Chicago, Ill.

☞ Please allow about two weeks for your knife order to be filled.

ESTABLISHED IN 1861 AMERICAN THE OLDEST BEE-PAPER IN AMERICA BEE JOURNAL

41st YEAR.

CHICAGO, ILL., OCTOBER 3, 1901.

No. 40.

* Editorial. *

A Bee Keepers' Paradise is what Editor Root calls Uvalde Co., Tex., with some other counties in that State and New Mexico. But after having raised the expectations of prospecting bee-keepers to the highest notch, he lets them drop with a dull thud by saying that Uvalde county is "fearfully overstocked."

The Buffalo Convention Report we expect to begin publishing soon. There were no papers read except at the joint meeting of the pomologists and bee-keepers on the last evening. So, practically, the whole of the report will be discussions of questions. This should make it very interesting reading.

Hive-Covers.—Saw-kerfs on the underside of hive-covers have been successfully used to prevent warping, but Editor Root says that after a thorough trial of such covers they have been abandoned, because in dry climates these saw-kerfs favor checking and splitting entirely too much. Even in northern Ohio they give a good deal of trouble.

Need of Laws on Bee-Diseases.—On page 631, Hon. J. M. Hambaugh, bee-inspector for San Diego Co., Calif., offers some highly important suggestions that should have earnest consideration.

The careful, up-to-date bee-keeper deserves to be fully protected from his careless, slipshod neighbors whose bees are more likely to contract deadly disease, and when once contracted is harbored and permitted to contaminate surrounding healthy apiaries. Surely, there should be stringent laws in every State to compel every bee-keeper to aid in the discovery of bee-diseases, and when found aid in its complete eradication. This is as much in the interest of infected apiaries as healthy ones.

Mr. Hambaugh also calls attention to the necessity of issuing a certificate from a lawfully appointed inspector, showing the healthy condition of every colony proposed to be removed from one locality to another. This certainly would be a wise provision. It would help in many instances, no doubt, to prevent carrying contagion from place to place.

Mr. J. M. Rankin, Michigan's alert inspector, has just had an experience in the direction indicated. He examined a lot of hives, combs, etc., belonging to a bee-keeper at

Evart, Mich., and finding ample evidences of foul brood, he officially ordered the bee-keeper to destroy the disease-infected combs, etc. Instead of obeying the officer of the law, he loaded the stuff on a car and shipped it to Clyde, Ill., near Chicago, where it will likely become a menace to the healthy apiaries in that locality.

Now, if Illinois had a good foul brood law, and an efficient inspector, this case would be followed up, and finally be gotten rid of.

But what kind of a bee-keeper is the man that would ship bee-disease from one State into another, instead of destroying it, especially when ordered to do so by one whose duty and authority it is to clean up such disease before it is spread any further? The offending bee-keeper deserves the severest condemnation possible by his fellows, and also the complete destruction of his whole apiary if even the slightest trace of foul brood is found therein. Any man who would so wantonly convey disease from place to place, rather than obey a wholesome law, should be held up to the scorn of all good bee-keepers and citizens, and be made to feel to the fullest extent possible the result of such wilful disobedience.

We hope that there may be sufficient agitation to secure the much-needed laws in all the States for the protection of bees from contagious diseases. In view of the good work already done by the few State, county and province inspectors of apiaries, it would seem that every State should be able to secure at least one inspector by the passage of a suitable law.

The Hive-Tool that suits best at Medina is a putty-knife, says the editor of *Gleanings in Bee-Culture*, while Dr. Miller says the Muench tool is away ahead of any other tool he has ever tried. Its broad semi-circular blade is easily wedged in under cover or super without marring the wood, and the other end is so constructed that a slight twist forces the frames apart with the exertion of very little strength.

Red Clover Honey.—A conversation is reported in *Gleanings in Bee-Culture* which is supposedly based on fact, from which it appears that a neighbor of G. M. Doolittle's, living two miles distant, finds red clover perfecting its bloom for the first time in 15 or 20 years, and his black bees are not to be seen on it at all, while Mr. Doolittle's yellow bees are just swarming on it. From some colonies Mr. Doolittle took as high as 80 one-pound sections of red-clover honey, while the average yield was not far from 65 sections. The Linden came, and made the total average from colonies not interfered with by queen-rearing

about 145 sections, the highest average he has had except in 1877. It would be just like him to say that he now places a higher value on long tongues than he did.

A Special Encouragement in Queen-Rearing lies close neighbor to the discouraging fact that we have little or no control of the drones. In order to stimulate to greater effort, it may be well to bring out with some minuteness wherein this encouragement lies. While it is true that drones from neighboring apiaries may meet our young queens, yet where one has a hundred colonies or more, especially if neighboring bees be few, the predominance in numbers of the drones in the home apiary makes the chance fair for some degree of safety from outside interference.

Let us suppose that we are so situated that outside interference of drones need not be taken into account. Suppose, too, that after close watch and careful record we have found one queen whose workers show marked superiority as honey-gatherers. All the better if the queen be of such age that such superiority has been shown in two or more years. The parents of this queen have had characteristics that made such a combination as to result in an offspring superior to either of the parents. Let us call the drone father of our present queen D1, the queen mother Q1, and designate their drone and queen offspring respectively as D2 and Q2. From our superior queen, Q2, will be reared the present season drones and queens that we will call D3 and Q3, and it will not be a difficult matter before the close of the season to have a Q3 queen in every colony in the apiary. Next season will then open with an apiary headed by Q3 queens, whose workers will be from fathers that vary from each other, hence the workers will be of varying value, none of them perhaps coming up to the mark of the workers of Q2, but taking the apiary as a whole there will be a noticeable improvement.

Now as to the rearing of queens next season. If our superior queen, Q2, is still living, and we are willing to take the risks of inbreeding, we may rear queens from her, or we may obtain a good queen of unrelated blood from elsewhere. In either case, the drones that meet our young queens will be the same, the sons of the Q3 queens, and may properly be called D4. Right in the character of these D4 drones lies our special encouragement. As parthenogenesis prevails among bees, these drones will not be of the same blood as the queen and worker progeny of their mother, but will be of the same blood as the Q3 queens themselves, and consequently of the same blood as the worker progeny of our superior queen Q2. Whatever superiority may have

been shown in the worker progeny of that queen, we have that same superiority in the drones with which the entire apiary is now stocked. Some claim that it is more important to have good drones than good queens, and no one denies that the drone is fully as important as the queen. So whatever the quality of the queens reared next year, we are sure of drones of best quality.

As already intimated, all this must be discounted by the chance of inferior drones from outside, but after making that discount there is still food for much encouragement in the thought that only superior drones are in our own yard.

The Best Fumigator.—A Stray Straw in Gleanings in Bee-Culture says:

If it is true that bisulphide of carbon will kill moth-eggs as well as larvae, why is it not a long way ahead of sulphur for those who fumigate their sections? Bisulphide can be used once for all when sections are taken off, or within two weeks, and save the repetition of the fumigation that sulphur requires, also saving the danger of making the sections green with sulphur. [If the reports are true, the man who persists in using sulphur in place of bisulphide of carbon is far behind the times. The bisulphide is more thorough, and much less trouble to use. While it is subject to more or less danger from explosion, the burning of sulphur, even in an iron kettle, also has its danger.—EDITOR.]

But even bisulphide of carbon may have to give way to gasoline, according to J. B. Rapp, who says in the same periodical:

I have just made an important discovery, to me at least; that is, that gasoline is as effective in killing moth-worms in bee-combs as bisulphide of carbon, and it does not cost a twelfth as much. My plan is to fill a tight box or barrel with combs, then pour in a pint or so of gasoline; close up tight for 24 or 36 hours, and the work is done. Gasoline beats sulphur far away, and is much easier used, and safer. I have used gasoline on hundreds of long-storm combs, and have no trouble with worms, as I think the gasoline kills the eggs as well as the worms.

The editor adds that he knows gasoline can be used in place of the more expensive drug to destroy ant-nests, but it takes a larger quantity.

The Production of Beeswax.—Harry Howe thinks there may be profit in producing wax instead of honey in Cuba. He says in Gleanings in Bee-Culture that in the olden time many apiaries were run entirely for wax, the honey being thrown away. At present wax brings 90¢ times as much as honey in Cuba, and the conditions are peculiarly favorable there for the production of wax, the honey-dow being eight months long, with hot enough nights during half that time for secreting wax without waste of heat. He says:

My plan is to cut out the combs instead of extracting them, and return the frames, but only half from each hive, extracting the other half so they will at all times have store-rooms. Then, when there is no longer a surplus to be had in the fields, contract the brood-nest and set out honey at one side of the apiary. As fast as they carry in the honey, melt the wax which remains; then when they have built their combs nearly down, set them out to be emptied and melted.

I think the improved condition of my bees in the beginning of the next harvest will about pay for the extra labor; but until it has been tried, no one knows how it will work.

Weekly Budget.

MR. JOHN C. WILMS, of Riverside Co., Calif., wrote us, Sept. 18, that he had taken off 26,500 pounds of extracted honey from 115 colonies, spring count. Pretty good average per colony.

THE APIARY OF LESLIE E. HAZEN, of Nemaha Co., Kans., is found on the first page of this issue. The photograph was taken from the northeast, so the rows of hives running north and south in the apiary can not be seen. We should think, however, that it is a very neat apiary.

MR. HARRY HOWE, the "lightning operator," has had some sympathy wasted on him by the report that he was hopelessly broken in health. It appears that the news of his ill-health was a year old or more, and his friends will be glad to learn that he is now as well as ever, and caring for about 1000 colonies of bees in Cuba. The report and the correction have both come through Gleanings in Bee-Culture.

MR. WM. ROHRIG, of Maricopa Co., Ariz., gave this office a call on Monday, Sept. 23. He had been in the East—New York, Buffalo, etc.—looking up the honey interests. He is vice-president of the Arizona Honey-Producers' Association, which has quite a number of car-loads of extracted honey for sale, but they think the prices offered so far are too ruinously low. Mr. Rohrig has about 300 colonies, in three apiaries. The principal source of honey there is alfalfa, which in that locality seems to yield a light amber honey, while in Colorado and Utah alfalfa honey is very white. This great difference in color seems quite unaccountable.

QUOTING THE HONEY MARKET.—Messrs. Blake, Scott & Lee, of Boston, write us as follows in response to Mr. Cooley's letter on page 363:

AMERICAN BEE JOURNAL.—We note with interest the letter of Mr. Stoughton Cooley in the issue of Sept. 5, and as we have had the honor of quoting in the American Bee Journal for several years past, a word from us might not be amiss at this time.

Our method has been invariably to quote from actual sales. During the summer months—in fact, we might say from May 1 to Sept. 1—the demand for honey is so limited that quotations are practically nominal and although we received quotation cards regularly, yet during this interim we very frequently simply state that "the market is without change."

Now, the question would seem to arise, Which is the more reliable, quotations given by the commission men from actual sales, or quotations from a trade paper? When it is known that the trade papers in the various centers must depend upon the commission men themselves for quotations, it will be seen at a glance that both the quotations the American Bee Journal receives, and those of the trade papers, are primarily from the same source, and in that event the former would naturally be the latest and most up-to-date. From our experience with quotations of other commodities, we know that the quotations in the American Bee Journal are more

apt to be reliable for this reason—you are quoting one specialty? In the trade journal, honey is but one of a great many, and for this reason will not demand the searching inquiries that the American Bee Journal is in a position to give.

By referring to the instance mentioned in Mr. Cooley's letter, it will be seen that it comes during the inactive period of the year; while if reference is made to the issue of Sept. 5, it will be found that the oldest quotation is Aug. 6, and from that on to Aug. 22, during which time we venture to assert that there could be no essential change in any market.

We might mention that in our business we have had occasion from time to time to write to different markets when for any reason our market happened to be short of supply, and we have invariably found that we were unable to buy at a lower price than prices quoted; thus proving the correctness of the quotations, and certifying to the value of the American Bee Journal to our shippers.

Wishing you continued success, we remain,
Yours respectfully,
BLAKE, SCOTT & LEE.

We should be pleased to hear from the rest of those who quote the honey and beeswax market for the American Bee Journal. We want to get at the bottom of this matter, and if there is a better way to get at actual market values we desire to know it, and avail ourselves of it. What have the rest of the dealers to say?

APIARY OF J. W. TUCKER & SON.—The picture on page 634 was taken from the roof of the barn. The aged lady to the right is Mr. Tucker's mother, and next are his wife and daughter Grace. The young man on the left is his son, and the people in the background are his next-door neighbors. The little boys came in at the eleven-th hour, but one can see them by looking closely.

It will be noticed that quite a few of his hive-covers are flat, and he says they are made in this way: The two gable ends proper are made out of 3"x13" inch wood rabbeted on 3/4" of an inch deep on the lower edge for the under lid to lie in, leaving 1/4 inch to hook over the end of the hive. The center gable is one inch. The top lid projects one inch all the way around, and the tin is turned down over it. There are several layers of this paper, of an inch under the tin. The one-inch air-space and the paper make the cover all right, and it doesn't cost much more than the other kind.

MR. JOHN G. COREY, of Ventura Co., Calif., wrote us as follows, Sept. 10:

I had no honey in 1898, 1899 and 1900, but this year I built up my bees to my original 200 colonies, and have taken 16,500 pounds of honey. My stock had run down to 135 colonies.

I am one of the old bee-keepers, having been in the business since 1890. My father kept bees in Cuba; he got his start from beetrees. We lived in Rock Grove, in Stephenson Co., Ill., 15 miles north of Freeport, settling there in 1836. We hauled wheat to Chicago, 110 miles, and sold it for 40 cents per bushel; camped out, and hauled oats to feed our horses for the round trip, which took seven to eight days.

MR. EDWIN BEVINS, of Decatur Co., Iowa, called at this office recently when on his way to Wisconsin for relief from a severe attack of hay-fever. We wish him complete relief from that terrible affliction.

Convention Proceedings.

(Continued from page 616.)

Report of the Texas Bee-Keepers' Convention.

BY LOUIS SCHOLL, SEC.

FIRST DAY—AFTERNOON SESSION.

The convention was again called to order by Pres. Salyer, at 2:00 p.m., and the first business was the report of the committee on constitution and by-laws. Secretary Schoil read the following, which was unanimously adopted.

CONSTITUTION.

ARTICLE I.—NAME.

This organization shall be known as "The Texas Bee-Keepers' Association."

ARTICLE II.—OBJECTS.

Its objects shall be to promote the interests of bee-keepers; the exchange of thoughts, experiments, etc., in apiculture, through the meetings of this Association; and through a closer relation of its members.

ARTICLE III.—MEMBERSHIP.

SEC. 1. Any white person who is in accord with the objects and the aims of this Association, may become a member upon the payment of \$1.00 to the Secretary-Treasurer, payment to be made at or before each annual meeting of the Association; or not later than 10 days thereafter. Membership will continue as long as all dues are paid up.

SEC. 2. Any person may become an honorary member of this Association upon a two-thirds vote of the members present.

ARTICLE IV.—OFFICERS.

SEC. 1. The officers of this Association shall be a President, a Vice-President, and a Secretary who shall be ex-officio Treasurer.

SEC. 2. The officers shall all be elected annually by ballots of the members of this Association at their annual meeting.

ARTICLE V.—DUTIES OF OFFICERS.

SEC. 1. *President*.—It shall be the duty of the President to preside at the annual meetings of this Association, and to perform such other duties as may devolve on the presiding officer. The President shall be ex-officio Vice-President of the "Texas Farmers' Congress."

SEC. 2. *Vice-President*.—In the absence of the President, the Vice-President shall perform the duties of President.

SEC. 3. *Secretary*.—It shall be the duty of the Secretary to keep the records of this Association; to make a report of the annual meetings; to receive membership fees; to make a report at the annual meetings; and perform such other service as the Association may direct.

SEC. 4. The President, Vice-President and Secretary shall form an Executive Committee. Their duties shall be such as usually fall to such officers.

ARTICLE VI.—FUNDS.

SEC. 1. The Secretary shall remit to the General Manager of the National Bee-Keepers' Association, within two weeks after the annual meeting, the sum of 50 cents for each paid-up member, as a membership in the National Bee-Keepers' Association for one year.

SEC. 2. The Secretary shall receive not less than \$10.00 annually for his services, and shall receive another sum equal to his legitimate expenses for the benefit of this Association.

SEC. 3. The remaining funds of this Association shall be expended as the members thereof may direct.

ARTICLE VII.—MEETINGS.

This Association shall hold annual meetings at such time and place as the members may select by a two-thirds vote at some regular meeting; but if in any event it becomes impracticable to meet at the place selected, because of unforeseen events, then this Association shall hold its meeting at such time and place as the Executive Committee may select.

ARTICLE VIII.—COMMITTEES.

The President of this Association shall appoint, yearly, the follow-

ing committees: Resolutions and Petitions; a Program Committee of one; and such other committees as may become necessary.

ARTICLE IX.—GENERAL.

SEC. 1. This Association shall ally itself with the Texas Farmers' Congress in every way possible, provided that such alliance is never detrimental to this Association.

SEC. 2. It shall be one of the aims of this Association to secure the passage of a law establishing an "Experimental Apiary" at College Station, together with the appointment by the Governor of an experimenter, who shall be recommended to him by the Texas Bee-Keepers' Association.

ARTICLE X.—AMENDMENTS.

This Constitution may be amended by a two-thirds vote of the members present at some regular meeting.

The new association now bears the name of "Texas Bee-Keepers' Association," leaving the "North Texas" and "South Texas" associations as "local" bee-keepers' associations. Every Texas bee-keeper ought to be a member of the Texas Bee-Keepers' Association now, as with its new constitution and a new set of officers a great deal of good work can be done if the bee-keepers will only lend that which these men have asked for—the help, assistance and co-operation of the bee-keepers, and with that the Association could make strides forward as never before; only we must have their help. Every bee-keeper in our great State ought to take pride in helping to build up a State association that will surpass all others, and this can only be done if they will give their assistance. Put your shoulders to the wheel, that is, your dollars into the treasury, paid for your annual membership, and help to keep it going. The greater the association, the more members it has, the more can be done.

Now something about what you get if you want to be a member:

By paying your annual dues of \$1.00, you are not only a member of the Texas Bee-Keepers' Association, but 50 cents of this one dollar is sent with all of the other members, to the general manager of the National Bee-Keepers' Association, securing membership with that organization also. Thus one is a member of his State association, and at the same time can enjoy all the benefits of the National Association at just half the regular rate. Of course, it will be well to bear in mind that to do this, members must act according to Article III of the Constitution of this Association, in regard to membership and membership fees.

Besides all this, a reduction has been secured in the subscription prices of our bee-papers, when pay for them is given to the Secretary of this Association along with their annual membership dues.

The Secretary was instructed to write to each member, of the change that has taken place; of the new name of the association; of its new constitution; its new business, objects and intentions; and to notify them of their annual dues of one dollar.

After this the general subjects on the program were again resumed, namely: "Manipulating Bees for a Large Yield of Extracted Honey," by O. P. Hyde, who said the main objects were, to have good, prolific young queens; large hives, not less than ten frames, then tier up as soon as room is needed, three or four stories high, and as soon as filled and well capped over take out the honey. He also touched on the minor points connected with producing large amounts of extracted honey; the above being the main objects.

W. O. Victor read an article he contributed to the Review, which, however, is too lengthy to copy, and the issue is not before me to make a summary.

FORCING QUEENS TO LAY IN CELL-CUPS.

"How Can Queens be Forced to Lay in Queen-Cell Cups?" was answered in a paper by H. H. Hyde. He does not claim to be responsible for being assigned that subject, and hopes nobody will be disappointed if he fails to give satisfactory solution of the question. He has not much experience to prove or disprove this query, but cited a case where he put cell-cups in top-stories of good colonies before grafting, to have them polished by the bees, when he distinctly remembers where in one case the queen laid an egg in such a cell, which was built out and hatched a queen. He said further that by placing cell-cups conveniently in a hive of bees that wish to supersede their queen, such queens could be forced to lay in them. Also at swarm-

ing time, queens can be forced to lay in such cell-cups conveniently placed in the hive; at other times it would not seem practical, and hard to be accomplished.

Mr. Stachelhausen thinks that it can only be done during swarming-time.

Mr. Atchley told how it could possibly be done, by placing cell-cups around and near drone-brood, conveniently, and where queens are mostly found after their regular season's laying has been at its fullest, when the queens are almost worn out from the hard work of depositing worker-eggs. It is then that they are almost crazy to resort to depositing drone-eggs, as it seems to be easier for them to do this than that of laying worker-eggs. This of course, like the other cases cited, will be at about swarming-time.

IMPORTANCE OF GOOD QUEENS.

A paper from Willie Atchley on this subject was read, in which he said that too much could not be said about queens. Good queens, good bee-keepers, and good localities make bee-keeping a success; and either of these essentials lacking, bee-keeping is a failure. It is highly essential that all apiarists look sharp to the profligence of their queens, and the working qualities of their bees. Give him good queens, and a good location, and he will turn out a crop of honey.

Mr. Weaver and others gave some of their experience about good queens, a good locality, good queens, and good management, being a sure road to success. Some told about the difference in queens, some being large and fine looking, but almost worthless in other qualities, while some of the very smallest, sometimes called "stub" queens, have done wonders. This, however, is not a rule.

REARING GOOD QUEENS.

This was by Mr. G. F. Davidson, who gave his *modus operandi*, which were given at previous meetings of the Central Texas Bee-Keepers' Association.

He recommends the Alley plan he has so long practiced, and with which he has been successful.

H. H. Hyde spoke in favor of the Doolittle plan and method, and although the *best* queens can be reared by the Alley plan, with the Doolittle method good queens, and more of them, can be obtained.

MOVING BEES.

O. P. Hyde had much and varied experience in moving bees, as he moves bees nearly all the time. He has also had some *fun* connected therewith, on which account he began to study to find out the best way to move bees, and has been quite successful. To close the entrances, he uses a device (the idea of which he obtained from a bee-keeper who did not know anything about bees, only having a colony or two), with which he can close up the entrances of 10 hives to one closed in the ordinary way, by tacking wire-cloth over the entrances. It is simply a piece of tin about two inches wide, with a cleat or piece of board half as wide nailed on the upper edge, all as long as the hive is wide. The lower half of the tin is perforated to give ventilation. Now with two *3d.* wire nails in the cleat, just tack on the entrances, and it is done.

Next, the cover is nailed down with two more nails, one on each side, into the side-walls of the hive. Two or more story hives are held together by means of strips of flat nailed to the sides of the hive, diagonally across the sides.

In hauling, one should have a wagon-bed wide enough so two hives can be set end to end across the bed, and other tiers the same way on top of these. For this purpose they have an "Electric" handy, low wheeled wagon, with a wide platform, having low side railings on the outer edges. If understood rightly, the back ends of the hives rest on these, leaving them slanting towards the middle from each side. The second tier, when put on top will then easily stay in place. In this way he has hauled bees for over 30 or 40 miles, and hardly a quart of bees were lost.

Mr. Davidson and others have used wire-cloth, but it is much trouble.

Mr. Atchley told about some of their experience, as they move bees extensively. They keep a large share of their bees on the migratory plan. Sometimes it happens to rain hard some distance from their bees, and the country around being a most wonderful one in regard to the quick growth of honey-yielding and other plants after a heavy rain, the flowers appear most abundantly in a very short time. It is then that they move whole apiaries from dry situations to the fields yielding nectar. For all this they are extra prepared with bee-wagons, and some 200 regular shipping-

cases with wire-cloth, provided with slotted cleats in which the frames are hung, with all the bees put in, closed up, and are then ready to haul on the special bee-wagons. The empty hives are hauled on any other wagon separate from the bees.

Mr. Victor makes large frames by ripping hive-bodies into rims, one inch square, on which wire-cloth is tacked. This is nailed over the top of the hives after the covers have been removed. He next sticks moss into the entrances, nails cleats, one on each side of the hive, and they are ready.

H. H. Hyde recommends cleats nailed on diagonally across and from opposite corners from the one on the other side. In winter or cold weather, wooden cleats to close the entrance are sufficient.

IMPORTANCE OF LARGE BREEDING-SPACE.

In a paper on this subject L. Stachelhausen said the secret of successful bee-keeping is to have the colonies at their fullest development just when the main honey-flow commences, for which purpose it is necessary to use different managements, whether the flow is early or late in the season. In most localities this honey-flow is so early that we have to do all we possibly can to develop the colonies at the right time.

His and other bee-keepers' experience has taught that in their localities they can get their colonies developed to the most possible strength before the main honey-flow, without any work at all, if they give them a large breeding-space and large comb-surface. This is the reason why Dabant recommends large frames and large brood-chambers. An experience of about 20 years has taught him that, in his climate at least, the division of the brood-nest into two or more shallow stories is no hindrance at all for the development of the brood; the queen will pass these "sticks" without any hesitation. On the other side the extension of the brood-nest to another comb, sideways of the brood-nest, is much more difficult. This is easily explained: The combs on both sides of the brood-nest generally contain a large quantity of pollen, and can not be used for brood before this pollen is consumed. To extend a brood-nest of this character sidewise, we are forced to remove these pollen-filled combs and replace them with empty ones; or to set empty combs into the middle of the brood-nest, as recommended by Mr. Doolittle. All this has to be done at the right time, not only corresponding to the strength of the colonies, but empty combs should be given just in the place where the queen is laying, because, even in this respect, the bees keep the brood-nest in wonderful order. For this reason the colonies have to be watched closely all during spring, causing a considerable amount of work, limiting the number of colonies a man could keep, especially if scattered in different apiaries.

If in large brood-chambers, with a large amount of comb-surface, all this work is unnecessary, because the development of the colony goes on without any work of ours, showing at once the advantage of such large brood-chambers. More colonies can be kept with the same amount of work; and even if the honey crop per colony should be smaller, which is doubtful, as by other management, the profit of the whole apiary will be larger. To get strong colonies in the spring, in such hives, it is necessary always to have enough honey in the hive, but not too much, with sufficient number of empty cells, or always enough more than the bees need at a given time.

Another advantage of large brood-chambers is that swarming is reduced to a minimum, especially so if the bees are kept in large hives during several generations. In this respect the condition of the honey-resources of certain localities are to be considered; in some localities swarming can be practically prevented by the use of large hives, while in other localities the number of swarms is reduced very much, and, to prevent these few swarms, other ways can easily be executed.

Nobody disputes these advantages of large brood-chambers in early spring, but some say that they have disadvantages during the main honey-flow. It would seem reasonable to ask, Why not use large brood-chambers in spring, as long as they are advantageous, and afterwards contract the brood-nest as soon as thought advisable? But this objection can not be overcome by this simple way.

1st. One objection is, when producing extracted honey, and using an unlimited breeding-space, during a very good honey flow, the brood-nest will be contracted by the honey which the bees store around the brood. Contrary, in a moderate honey-flow, it is said, that the bees will use the large space to breed extensively, and will store very little honey, at the end of the flow leaving a strong colony of useless

consumers only. This objection is especially raised in Germany, where small hives are used.

If large hives are used all the year around, there will be strong colonies in the spring, which will develop much faster than weaker ones.

When the queen has reached the limit of her egg-laying capacity, which is a little more than 3,000 eggs daily, it will be impossible to extend the brood-nest any more; the queen will soon need a rest; the number of eggs laid daily is diminishing, and the now very strong colony will send out a very strong force of field-bees. Contrary, if we have a weak colony in the spring, in a brood-nest too small for proper development, the queen can not reach the limit of her egg-laying power; now the honey-flow commences, and we give the supers, it is only natural that the brood-nest is extended into these supers, and a large part of the flow is used to rear these worthless consumers, so much talked about. This undesired condition is caused by the small brood-chambers used in early spring. During the spring the queen could never lay all the eggs she would be able to lay, for lack of empty cells at the right place. Now, by giving a super with empty combs during a moderate flow, the queen is given the best occasion to extend her egg-laying to her fullest capacity. This will be prevented if the honey-flow is very good, and so fast that the bees fill the cells faster with honey than the queen can lay eggs in them, or if she is kept down in a limited space by a queen-excluder. By the latter manipulation a large or small amount of honey may be obtained, according to the strength of the colony; but development has been hindered in the spring, consequently the colony is not as strong as could be, besides the large amount of unnecessary labor expended.

2d. Of more importance is the objection, that large brood-chambers are in a bad condition for the production of section honey, when the main flow commences. When the section supers are put on, at the beginning of the main flow, the combs in the brood-chamber should contain as much brood as possible, and some bee-keepers want a brood-chamber of such a size that the queen can keep full of brood during the honey-flow. Hence they neglect the advantages of large brood-chambers during spring, and try to build up strong colonies in small chambers, by manipulating the frames, *a la* Doolittle, with some considerable work.

The problem is, how to use the advantages of large brood-nests in the spring, and the advantages of small brood-nests during the main honey-flow, both combined, without their disadvantages.

He solved this problem in a very simple way. It is well to know that no colony is better fitted for storing honey in sections than a strong swarm issuing just at the beginning of the main flow; especially if two or more swarms unite just at the right time, we may get from them a good crop of comb honey.

Gravenhorst taught, about 15 years ago, how to form such swarms at any time, and have them work with the same vigor as natural swarms. Consequently, it was easy for him to combine these two experiences and in this way to solve the problem.

Since publishing his way of producing comb honey, more have appeared who use ways similar to his.

The construction of the hive is of less importance, as we can use large brood-nests in different ways. Those who have 8 or 10 frame hives may take two stories for a brood-chamber, one on top of another. He uses shallow cases, and the bees have brood in three or four of these in the spring. Dadant prefers large combs in single stories; all these managements have advantages and disadvantages.

One thing is important, that the frames are wide enough; fortunately this question is settled for the United States, for the width of the Langstroth hive is the standard here, and large enough. Other things could be considered with the advantages of large brood-chambers.

(Concluded next week.)

Why Not Help a Little—both your neighbor bee-keepers and the old American Bee Journal—by sending to us the names and addresses of such as you may know do not now get this journal? We will be glad to send them sample copies, so that they may become acquainted with the paper, and subscribe for it, thus putting themselves in the line of success with bees. Perhaps you can get them to subscribe, send in their dollars, and secure for your trouble some of the premiums we are constantly offering as rewards for such effort.

Bee-Diseases in California—Laws Needed.

BY HON. J. M. HAMBAUGH.

ALL is not gold that glitters," but every cloud has its silver lining. This I have found quite applicable to our chosen pursuit of bee-keeping here in California, and among the many clouds that hang about the bee-keepers' horizon is that of bee-diseases.

Here, in this salubrious clime, where every month in the year, and almost every day in the year, bees can go forth in quest of pollen and nectar, opens opportunity for the spread of infectious diseases, and this, coupled with the wild waste of rocky cliffs, canyons, and wooded districts, furnishes hiding-places for bees, that can wreak and fester in diseases unmolested. It is hard for the wide-awake bee-keeper to overcome these dangers beyond his reach, but there is a danger of far greater magnitude right at his very door, that he needs to recognize, and which needs a cure, in the form of a little legislation.

Here is Mr. A, a practical bee-keeper, with all his combs throughout his entire apiary movable, and accessible at any time for inspection, and in appropriate condition to battle against any disease that may arise. Mr. B, his next door neighbor, is of the slipshod, go-as-you-please bee-keeping make-up, and allows his bees to build their combs at haphazard, half-moons, and all shapes that may suit their fancy, in their brood-chambers, and the consequence is, he is locking the door against all knowledge or treatment of any disease that is likely to turn up; he is also in shape to be (as it were) hugging an adder to receive its fatal sting, and also to dispense its venom among his neighbors. When there is such a deadly foe as foul brood abroad in the land, these inaccessible hives are a veritable death-trap, and so far as inspectors are concerned, they are simply barren from investigation, save what the exterior may reveal.

In our route through the country these troubles are so manifest, and there is such a universal cry against their toleration, that it seems to me a very easy matter to have a law placed upon our statutes, compelling every one who keeps bees to have them upon movable combs, built in movable frames, and, by so doing, minimize the chances for contagious diseases, besides doing away with the old slipshod way of keeping bees. We believe that every wide-awake bee-keeper in the land should cry down the box-hive, stationary-comb evil, until every one who dares to keep bees would understand that to do so meant they must be upon movable combs, or the penalty of a fine incurred.

We also believe that a little further protection is needed to the bee-keeper, by statute enactment, and that is, when a bee-keeper contemplates moving from one location to another, he should have a certificate from a lawfully appointed inspector, the said certificate to be an assurance that each and every colony is free from all infectious or contagious disease, otherwise let it be a finable offense to remove them from their old location.

Now, Editor York, I have sounded the slogan of war, let us hear from you as well as others interested, and see which one of the sister States will be the first to start this good and much-needed reform. San Diego Co., Calif.

Robbing in the Apiary—Honey-Packages.

BY C. DAVENPORT.

I WOULD like to be allowed to say a few more words in regard to robbing. Last year I wrote an article in which I gave some of my experience in regard to bees robbing, and afterwards in some comments that were made about it, it was said, in effect, that the advice I gave on the subject was about like advising one to scatter live coals among dry straw. But this is a mistake, for I did not advise any one to practice my methods; in fact, I remember that I plainly said that I did not advise any one to follow my practice. I only gave my experience in regard to the matter; but what I wish to say is that, in my opinion, it

will some time be known, and generally recognized by beekeepers, that a colony of bees of average strength (and, I feel tempted to say, quite weak colonies if in normal condition) are never, as the saying is, "cleaned out by robbers," or never molested by them enough to injure them materially in any way, no matter what has been done to induce robbing, or what the natural provocation to the same may be, except when they are first set out in the spring.

I have watched this matter very closely the last ten years, and, besides, from two different incidents I have witnessed, I know that a colony of average strength will, before succumbing to robbers, make such a fight as few would imagine them capable of doing. One of these incidents may be of enough interest for me to take space to describe briefly.

It occurred in an out yard during a time of great scarcity. A hive was in some manner tipped over, off its stand, so that it lay on one side, with the whole top and bottom fully exposed. Two heavy combs of honey were broken. How long it had lain in this position I do not know.

When I arrived, the air near it was black with bees, and thousands were dead on the ground around it. But the robbers, so far as I could determine, had secured but very little of these stores, so gallantly defended, and the colony was far from being whipped or defeated, though no doubt they would have been if the hive had laid in this position long enough. I know that colonies, sometimes quite strong ones, are often cleaned out by robbers, but they are colonies that are not in a normal condition. Usually in such cases they are hopelessly queenless, and make but little effort to resist robbers.

PAPER PACKAGES FOR EXTRACTED HONEY.

There has been a good deal of discussion the last two years or so in regard to the best package for extracted honey. I have read with much interest what has been said in regard to the matter, and I envy those who are able to make a success of using barrels, for I have never been able to get any kind of a barrel that would hold honey in a warm, dry room without leaking. Even when I coated the inside a quarter of an inch thick with wax or paraffine it would soon crack and allow the honey to ooze out between the staves. But my failure in this line was not because the barrels were not dry enough; I have kept both those made from hard and soft wood in a dry, warm room for two years, and then after driving the hoops as tight as could possibly be done, they would soon commence to leak after honey was put in them. I have not only tried different kinds, but a year ago last fall I had three large ones made to order, which were warranted not to leak.

I have, however, made what might be called a success of sacking up extracted honey the same as one would wheat or other grain. Last fall at one time I had about 1000 pounds sacked up. Possibly in the future extracted honey may be shipped in sacks instead of cans or barrels.

The way I came to put honey in sacks was this: The three warranted barrels mentioned, which held about 500 pounds each, got to leaking soon after being filled—two of them badly. I had nothing on hand to put much of the honey into, but I had observed when using the no-drip shipping cases that if a section become broken or marred so the honey ran down on the manilla paper tray in the bottom of the case, this paper seemed to hold it as well as a tin tray would; and I had noticed, at the place where I board, a number of very heavy paper sacks in which flour had been purchased. I found they had a large number of these laid by, the accumulation of years. The paper they were made of was very much heavier and tougher than that used in shipping-cases, but, instead of being glazed or smooth like the latter, it was slightly rough or porous looking. So I took a couple of these sacks and thoroughly coated the insides with beeswax, and filled them with honey. They held it all right, and soon afterwards enough sacks were waxed to hold all the honey the two worst leaking barrels contained.

The honey remained in some of the sacks nearly a month, and no leakage whatever occurred, except with one sack, and this was owing to a defect in the sack.

My method of waxing the inside was to pour a large quantity of melted wax in a sack, then with one hand gather up the mouth of the sack tight, and with the other hand take hold of the bottom at one corner, so as to turn it bottom side up and around in such a way that the wax would reach and coat all parts of the inside. This had to be done quickly, or a good deal of wax would adhere to a sack. It took considerable to wax them, anyway, but after

the honey was taken out, the sacks were cut up and boiled in water, by this means getting all the wax back again.

My success with these large sacks led me later to try small sacks for the retail trade. A good many who come to the house for a few pounds of honey never bring anything to put it in; few of them will buy a pail or jar, and if I lend them a dish to carry it in all of them will readily agree to return it and then never do so. I have many customers in town to whom I carry a few pounds of extracted honey, and in this case I either have to wait for them to empty the dish I carry it in, or else call for it again, when, if there is any one at home, we may perhaps find it has been filled with something else. For instance, last season one lady ordered three pounds; I had nothing smaller than a gallon jar on hand, so I delivered it in that. When I called for the jar, some time afterward, it was full of butter. She said she, of course, supposed the jar went with the honey. My experiments last season lead me to believe that I can reach this class of customers with a package that will go with the honey, for it will cost only about half a cent aside from some work in preparing it, which can be done during the leisure time in winter; a package that will give satisfaction to the customer, and be practically as safe to carry or deliver the honey in as one made of tin.

Southern Minnesota.

The Season of 1901, Suggestions, Etc.

BY A. BOOMER.

AS the American Bee Journal is anxious to have reports from bee-keepers, as well as any suggestions they may be able to make as a result of experience in the management of bees, I send my report of the season, as well as one or two suggestions that may be of use to beginners.

NO HARM IN REPORTING LARGE HONEY CROPS.

My honey crop has been a very good one, but if I tell what it is, down may go the honey market. Pshaw, all rot!

About the close of the season, which has been a fairly good one in this Province, a local reporter of one of the county papers, made some enquiries for use in the weekly report. A statement was given which appeared in the next week's issue, that Mr. So-and-So's honey crop would likely be 9000 pounds from some 90 colonies, spring count. Since the report in the paper appeared, the demand for my honey has been so great that I could sell ten times the quantity I have, and at better prices than I have formerly realized.

Since the said report was given, we have about finished extracting, and find the quantity to be fully 10,000 pounds, and I am pleased to find that most of the colonies have a fair supply for winter, so that very little feeding will have to be done. A considerable number of the colonies, I find, have superseded their queens.

Having all the bees I was able to take care of, or had room for, I discouraged swarming, and have only an increase of about 25 percent. I have not practiced queen-clipping, but, having no help this year, I was unable to keep so close a watch upon them as is necessary when the queen's wings are not clipped, and as a result I lost several swarms. Next season I will try what clipping will do to prevent this.

BUILDING UP WEAK COLONIES.

I notice that several correspondents are troubled to know how to build up weak colonies in the spring, or, in fact, at any time of the year. I have practiced changing positions of the weakest and strongest colonies, with good results. I suggest doing this on a fine day, when the bees are either gathering pollen or honey—say about noon—and if I have a colony becoming very strong, and I do not want increase, then exchange this with the weakest colony in the way suggested, and the chances are that swarming may be averted, and your colonies all averaged up and ready for the honey harvest.

This season I had a very weak late swarm of nice bees, that I wanted to retain, but they were entirely too weak to build up. I changed positions with a strong colony a few days before the honey-flow ceased, with the most satisfactory results—no fighting, nor any disturbance that I could notice.

CROSS BEES—THE "JOUNCING" METHOD.

My bees were unusually cross this year, there being only a day or two at the close of the basswood flow that I could extract without a veil, and mostly had to use gloves in addition to being well protected otherwise.

I tried the "jouncing" method of getting the bees off

the frames, recommended by Mr. Davenport, but while it may work with nearly empty frames, or the shallow Heddon frame, I am satisfied it will not do with any large-sized, well-filled frames.

NO USE FOR BEE-ESCAPES.

I have also tried bee-escapes, but have given them up as practically worthless. I have no time to fool away with them.

The honey-flow exceeding my expectations, I had to defer extracting for want of time to put it in, and so tried bee-escapes, but, being alone, I found it about as much trouble, and got about as many stings getting the bee-escapes adjusted, as I did in getting out the combs without them. My plan has been to start after noon, give the bees a good smoking, take out the frames quickly, and run them into the extracting room, and stack them up three and four deep, until I had 10 or 12 in; then extract these. In the meantime the bees would get somewhat quieted down in the yard, and I would then get off a few more. Any bees that would go in on the combs would soon find their way to the windows, and go out of the escapes.

The season being unusually dry, the honey is of very fine quality, and sells readily in small quantities at 10 cents. Lately we have had abundant rains, and the bees are breeding freely, which augurs well for good wintering.

"HIVING TWO SWARMS IN ONE HIVE."

On page 581, Mr. Davenport says he has had no trouble from hiving two swarms together when both issue at or about the same time. In July last, when I had a large swarm nicely hived, but before I could remove it, a large swarm issued, and there being a cluster of bees on the front of this hive, it came down and went in with them. I at once put on a queen-excluder and two cases of sections with mostly drawn comb, to give them room. On the 5th day after, one of the swarms came completely away, and clustered on a limb of the tree exactly where the first swarm had clustered, which led me to believe that it was the first swarm that had left the hive, as the others never clustered at all. The time between the issuing of the two swarms at first was not more than 15 minutes.

My experience thus far leads me to conclude that bees do not do everything by rule, and we may always expect them to do something we never knew them to do before.

Ontario, Canada.

* The Afterthought. *

The "Old Reliable" seen through New and Unreliable Glasses.
By E. E. HASTY, Sta. B Rural, Toledo, O.

THE TWO-HIVE FEEDING PLAN.

Yes, Mr. Fargo's two-hive feeding seems to offer fine possibilities. But first we must find out whether it will work as a regular thing, or only in exceptional cases. If the open-topped screen-yard we had up a bit ago will work that will be pre-eminently the way to feed. Apparently the two ways will combine kindly. I think that one grand trouble about prolonged feeding in the home hive is that bees declare it annexed, and decide to let it be till needed. Some danger of the same thing in the two-hive method. In the open air a salutary fear that somebody else may get it will keep all but the very laziest pegging away. Page 531.

BLACK COMBS DISCOLORING HONEY.

I agree heartily that black combs will discolor the inclosed honey somewhat; yet I fear that the attempts to soak them clean are entirely impractical. The situation is this: Many layers of dried dirt, separated by many exceedingly thin layers of silk or wax. The best we can do is to keep the whole thing dry. The first soaking removes part of an outer layer, and makes the whole wet and nasty. With each successive soaking more, and always more, dirt keeps coming "from away back." Ram a two-quart can one-fourth full of dirty handkerchiefs (such as are found in a bee-keeper's trouser's pocket at the end of a hot week); fasten them down so they can not be moved about; and how long are the bottom layer will be cleaned by turning water in and out the top? Page 531.

HIVING TWO SWARMS TOGETHER.

To C. Davenport, page 581, I would say that my experience with voluntarily hiving two swarms together is not large, because I usually avoid it when I can; but they go together in spite of me pretty often; and my troubles with balled queens when swarms are mixed are, by no means imaginary. Quite willing to let his many successes have their due weight—and also quite glad to have so sound a veteran to fall back upon as Dr. Gallup, page 532:

"If you have two or more swarms come out at one time and cluster together, or if you have after or second swarms with more queens than one and you wish to separate them, shake them into the clustering box and let them stay for half or three-quarters of an hour, and the bees will ball the surplus queens, and roll down to the lower edge of the box."

I note that Dr. Gallup says, "Sometimes they ball every queen, but not usually." I think that with me balling every queen is rather the rule than the exception, if the swarm is a mixed one. Why this difference? His experience, I think, has been mostly in fat locations, where bees seldom swarm except during honey-flow. My experience has been in a lean

MANUFACTURES AND LIBERAL ARTS BUILDING—PAN-AMERICAN.

location, where bees often swarm in time of dearth. As I see things, bees carrying little or no honey are not sure to be cross to their keeper, but pretty sure to be severe on stranger queens. In a mixed swarm all the queens are stranger queens to thousands of the workers, and if they balled some of them, and did not ball all of them, it would be a curious fact calling for explanation.

Glad to see that Dr. Gallup has had experience in making a colony into an impromptu swarm cluster in a box for the purpose of moving their location a short distance. Have wondered whether that would work. He finds that it does.

HARD TO DESTROY ALL DRONE-BROOD.

I smiled when J. D. Gehring said that he found destroying all drone brood harder than he expected, and that unforeseen things happened. Been there. My dear bee fever child, don't you be too sure you can destroy all drone-brood—not even by the excellent Doolittle plans on opposite page. Page 533.

SHOWING MERCY TOWARD ANIMALS.

Prof. Cook, on page 537, did not pass on from mercy toward animals to mercy toward bees; but there is room for quite a sermon on that point. This paper surely goes to many readers who want to do just right in the little things of life. I have often felt it a difficult problem to decide just when a bee's little life ought to be spared (at appreciable expense of time, which means money), and just when the prompt sacrificing of the little life is the real right thing to do. I have also wondered about the would-be robbers and stingers, how much less claim they have upon our mercy than the more quiet members of the hive. I rather think that the insect door-keeper, doing duty promptly and well, should be a subject of admiration to a reflective and right-minded man—and that the sentence, "He stung me," ought not to be in such large vocal type as it is often put. Per contra, there gets aloft at times a considerable amount of sentimental nonsense and un wisdom, which would fain make us more careful of insect life than the Creator is himself, and which would make apiculture impossible before we got to its logical conclusions.

Our Wood Binder (or Holder) is made to take all the copies of the American Bee Journal for a year. It is sent by mail for 20 cents. Full directions accompany. The Bee Journals can be inserted as soon as they are received, and thus preserved for future reference. Upon receipt of \$1.00 for your Bee Journal subscription a full year in advance, we will mail you a Wood Binder free—if you will mention it.

Conducted by Prof. A. J. Cook, Claremont, Calif.

OUR VENICE.

Time and money spent in wedding all the home influences and attractions and loves and sympathies, are well spent. A year ago I was driven along the "Mountain Boulevard" which leads from Santa Barbara to charming Montecito. This drive of seven or eight miles is one of exceeding beauty, it seems to me of almost incomparable beauty. As we sped along looking now upon the beautiful ocean, now skirting some beetling cliff, now plunging into some bower of green that seemed to block our way, I said over and over, "Oh, that the others of the home were here!" I said, "Before a year goes by, they shall, with me, enjoy this bit of Nature's finest tracery."

The year has been a brighter, happier, better one, as the memory of the charming landscape has given added charm to my life, and as the prospect of all of us of our home circle making that beautiful circuit together has been ever before me, I have been in a sort of perpetual sight seeing with the dear home loved ones the year through. But the far summit of this pleasurable experience was only reached when last Saturday we all actually enjoyed together that wonderful bit of landscape. It was a red letter day in my family.

Santa Barbara has been called the Venice of America. I have never looked on Italian landscape, but I am sure it suffers no wrong in the figure. While there is not the thrift and wondrous beauty in its entirety that we so much prize and admire in Redlands, yet here one of the finest bays of the world lays its inexpressible charm before us. Many beautiful homes attract us as no other section of California can or does. I have never seen such a wealth of adornment in shrubs, trees and flowers, as this section has to offer. As I come to visit these lovely homes each year—and I never pass them by—I feel that I have a real ownership in them. The graceful cocon palms, the incomparable bamboos, the delicate, exquisite tree-ferns, and countless other vines, shrubs and trees, till one with delight and admiration.

Montecito, the wonderful suburb, has some of the finest homes and the best adorned residences to be seen any where. As one drives along among the hills, shaded by live-oaks, he is ever and anon coming to a place where wealth, taste and Nature have combined to paint a picture that one loves to hang perpetually on memory's walls. I am glad when wealth gives to us such marvels of beauty as lovely Montecito so proudly exhibits, and I am more glad that Wealth does not keep them to herself, but seems pleased to share them with others of us that else would know them not. Surely, no one will come to California without feasting on the rare, exquisite beauties that make Santa Barbara and its lovely suburb so famous the world over.

TWO FORTUNATE WOMEN

"Ventura by the Sea" is the county-seat of the county by the same name. It is only a few miles from our American Venice. Scarce more than an hour by cars, which connect the two cities along the sea and give one a ride that is never to be forgotten. Here two women live that I am proud to know, proud to honor, proud to introduce to our readers. One of these women is Mrs. Gould, who has produced petunias that have startled the world. The other is Mrs. Shepherd, who has been equally happy in adding to the world's wealth of choice, incomparable begonias. If there is anything in the way of floral loveliness that outvies Mrs. Th. Gould's petunias, it is Mrs. T. B. Shepherd's begonias. If there are flowers and foliage any where that rival Mrs.

Shepherd's begonias, they are in the not distant garden of her neighbor, Mrs. Gould. The whole world is enriched by the fond efforts of these two women. We have rarest, richest beauty that else we should not have known, for they would not have been.

Again, two women have done this beneficent work. We expect new, rich, rare developments from men. We have not usually found our grand women stepping to the front in such realms. We glory all the more when such strides are taken. I wish every home in the land could enjoy Mrs. Shepherd's begonias, and every household know more of God and pleasure because Mrs. Gould's petunias were daily companions. I know of one home that is so blessed, and its inmates are very grateful.

HOME FLOWERS.

I know of an orange orchard, ten acres, which recently sold for \$12,000. I thought it a great price, and so asked the recent owner how he was so fortunate in his sale. He replied: "My roses and palms did it." His entire place is skirted by great fountains of green in the magnificent Phoenix palms, and alternating with these are most lovely roses, which grow and bloom as only California roses can do. Why can not every home rejoice in such loveliness?

I know that next to wife and the dear children, nothing so weeds us to home as the flowers. I heard a lecturer say, a day or two since, that it was his business a few years ago to visit all the homes of a certain region. He said he found the home yard and porch the most certain index to the refinement and courtesy that would greet him in the home. He said he fancied that even the dogs in the flower-decked homes were more kindly in their reception. I believe it. Flowers set a kindly, genial spirit, and every dog even is quick to feel and sure to be mellowed by such spirit. Were the flowers to be taken from our house, porch and yard, we would all wish to go with them.

THE ANT-LION.

A queer insect! What strong, sharp jaws! What a fierce, daring temper! A very rat-terrier among its kind. A unique home is his. He always dwells in the loose, shining sand. Above him is only space, for he rests at the very bottom of a funnel in the friar le earth. His threatening jaws are alone visible; for all else is covered by the sand. Above him the side walls of his funnel are so steep that even the quick, wary ant passes its margin at its peril. Once on eager, daring, fearless ant-lion feels the tell-tale, falling sand, and he knows that another victim has had the temerity to brave the lion in his lair. He at once throws a harsh shower of sand, which surely brings the intruder down to the very jaws of death. No sooner has he the luckless wanderer in his merciless jaws than the latter is shaken as never a rat-terrier shakes his prey, until the poor victim has daylight and life shaken from him.

Thus these ant-lions are our good friends, for they take their often meals of insects that would else feed on our fruit

APIARY OF J. W. FICKER & SONS, OF JEFFERSON, CO., PA.—See page 628.

and vegetables. The mature insect—the imago—that comes from these fierce, formidable ant-lions, looks much like a dragon-fly or darnig-needle, but is easily told as the latter has very small antennae, which are hardly visible, while those of these insects, though not large or long, are plainly to be seen.

I have just been visiting a sandy tract where these funnel-shaped holes and homes of the ant-lions were very much in evidence. I have all our boys and girls will hunt them up, and collect the fully grown ones, that they may rear the flies.

Questions and Answers.

Questions on Breeding of Bees.

1. In selecting queen and drone mothers, what is the most important part to look to, to improve the stock?

2. Why do the most of queens produce drones not uniformly marked? And some queens will produce uniformly marked drones. Does it denote impurity with those that do not produce uniform drones?

3. Do you think it best to have the queen mother and the drone mother of no kin? or does it not make any difference if they are closely related?

4. Are the drones pure from a queen that is mismated, but reared from a pure mother? SOUTH CAROLINA.

ANSWERS.—1. In either case the important thing for practical purposes is to have mothers whose worker progeny show good results in the harvests gathered. All the better if of pure-established blood, but in any case the workers should be good honey-gatherers.

2. I don't know why. I hardly think that a difference in the appearance of drones is a sure proof of impurity.

3. Other things being equal, it is decidedly better that there shall be no close relationship. Those who breed for improved strains make some of their greatest triumphs through using closely related blood, because it is easier to find the same characteristics in two animals nearly related; but while it is easier to perpetuate good qualities through close relationship, it is also easier—perhaps ought to say it is still easier—to perpetuate bad qualities through close relationships. On the whole, I believe it is a pretty safe thing for common bee-keepers like you and me to let close breeding alone.

4. If I should be obliged to answer that question in a single word, I should say yes, and for all practical purposes that is the right answer. But if you draw the matter very fine, it will be said that when a dam has borne an offspring her own blood may to a slight degree be affected by the blood of her offspring, and hence the drone offspring may be slightly affected. Dzierzon, however, always counted that the mating of the queen had no effect upon her male offspring.

Several Queen Questions.

1. I have been working a few colonies of bees for six years. I now have 30 colonies, and this season I have been more perplexed than ever at their actions. In the first place, my text books and papers teach me that with the sealing of the first queen-cell the old queen will issue with a swarm; but I have had several instances this summer where it failed to be true, after watching them for several days, after the cells were sealed, for swarms. I either killed or caged the old queen and destroyed all but one cell. What was the cause of their acting so? Was it a case of intended superseding? If so, how am I to tell which is intended to swarm or supersede?

2. The queen of one of my best colonies disappeared, and they swarmed with a very small virgin queen. My wife caught her, but she got away and the swarm returned to the old hive. This was about 5 o'clock p.m. The next morning I looked through the colony and found a very fine virgin queen, and several capped cells, so I closed the hive and watched for a swarm. The queen kept peeping, off and on, all day, but no swarm issued, and after watching for two days I opened the hive again and found the new queen gone, and a small one in her place, and cells all destroyed. What was the cause?

3. I had several colonies in normal condition, that sealed queen-cells without anything in them; or, at least, after waiting beyond the required time I opened them and found them empty.

I received a premium queen and tried to follow directions very carefully, but after eating the pasteboard off and part of the candy, they quit and kept clustered very tightly over the cage. After waiting three days I smoked them and turned the queen loose, but they balled her immediately, so I re-caged her and took four frames of hatching brood and set over a strong colony, with a flour-sack between, for several days. I kept her caged with her attendants for a day, then turned her loose, and after two or three days I set the hive on a stand by itself, and opened the entrance; but the next time I opened the hive she was gone. Now, what became of her? She acted like a virgin.

NEBRASKA.

ANSWERS.—1. "Bees do nothing invariably," and there are exceptions to all rules. It is impossible to say whether queen-cells are intended for swarming or superseding by the appearance of the cells, but you can generally make a pretty good guess from attendant circumstances. If you find only two or three cells, you are pretty safe in guessing that swarming is not intended. Of course that refers to cells well advanced, for when first begun for swarming there may be only one or two. If 8, 10, or more cells are started, you may feel pretty sure that swarming is in contemplation. The time when cells are found will help you to make a guess. Early in the season, when swarms are issuing every day or so, the presence of queen-cells points pretty strongly toward swarming; when the honey-flow is about over, they point toward superseding.

2. A little hard to say. It is just possible that the small queen you saw last was the fine queen you had previously seen; for sometimes a queen just out of the cell looks quite different in size and color from what she does later. But it may be that the bees concluded not to swarm, and allowed all the queens to emerge, or to be destroyed. The piping of a queen is usually an indication of a forthcoming swarm, but not always. To be a reliable indication of a swarm, there must be the piping of the free queen and the quaking of the young queen or queens still in the cell. A young queen may pipe if no other queen is in or out of a cell in the hive, and a young queen may quack before emerging without the piping of another queen.

3. Are you sure that nothing had been in the cells? It is a common thing for bees to fasten the cap on again after the young queen has emerged, and sometimes they play a practical joke on a worker that happens to be in a cell from which a virgin has emerged, by fastening the worker in the cell.

4. It is possible that in some way the colony had a virgin queen—one might fly into the hive without your knowledge, or a queen-cell may have escaped detection—and so there was an unconquerable hostility to the stranger, which would be in a less favorable condition for acceptance through the journey in the mail and the prolonged imprisonment. Such a queen may look very like a virgin, and then after commencing to lay become as large as she was before mauling. The probability is that the bees killed and dragged her out.

Dividing Colonies in Double Hives.

I have three double colonies. Would you recommend giving the top chambers a queen, and putting it where the bottom chamber is, and putting the bottom one on a new stand? Or what is your plan? INDIANA.

ANSWER.—In this case the supposition is that a colony in two stories is sufficiently strong to be divided. As to the best procedure, conditions must be consulted. The plan you suggest is all right if the upper story is weaker in brood and bees than the lower. In other words, leave on the old stand the weaker of the two stories, giving it the new queen, putting the stronger story with the old queen on the new stand. If the desire be to have the two colonies more nearly equal in strength without considering the honey crop, you might make the division at a time of day when most of the bees were in the hive, and put the stronger half on the new stand with the old queen, fastening the bees in the removed hive for a time, perhaps till the middle of the next forenoon, and carefully guarding against smothering. Of course the new queen must be caged as a newly introduced queen. But it's pretty late in the season to talk about dividing now.

REVERSIBLE WALL MAP

—OF THE—

UNITED STATES AND WORLD,

WITH SPECIAL INSET MAPS OF

China, Cuba, Porto Rico, The Philippines, Hawaii, and Alaska,

Especially prepared to meet the demand for a first-class map that will give a quick, general idea of location of events the world over, and particularly to the United States and our territorial possessions. **Very useful in every Home and Office.**

66 X 16 INCHES IN SIZE.

ELEVEN BEAUTIFUL COLORS.

Best and Most Necessary Map
Ever Issued.

No Home or Business House
should be without it.

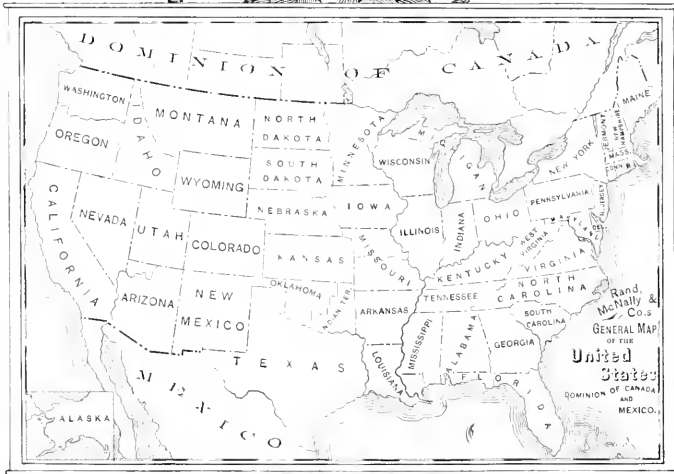

The Plates

are works of art. The engraving is plain, bold, and decisive. The color work is elegantly contrasted, but not gaudy.

Perfection and Artistic Elegance

a salient feature of this map not approached by any similar publication.

Marginal Index

is one of the invaluable features.

It gives an alphabetical list of countries, their location on map, style of government, a population, area, products, minerals, imports, exports, etc.

It has been pronounced a
Photograph of the World

The 1900 Census
of the largest American Cities is given.

One side shows a grand map of our great country, with **counties**, railroads, towns, rivers, etc., correctly located. The other side shows an equally good map of the world. Statistics on the population, cities, capitals, rivers, mountains, products, business, etc., a veritable photograph of the UNITED STATES AND WORLD.

The map is printed on heavy map paper and is mounted on sticks ready to hang. Edges are bound with tape.

1901 EDITION. Every reader should consult it every day. The plates show all the new railroad lines and extensions, county changes, etc. Especial attention is given to the topography of the country: all the principal rivers and lakes, mountain ranges and peaks are plainly indicated. The leading cities and towns are shown, special attention being given to those along lines of railroads. The Canadian section of the map gives the provinces of Ontario, Manitoba, and British Columbia, with nearly all of Quebec and New Brunswick, the county divisions being clearly marked. The Southern portion of the map includes the Northern States of the Republic of Mexico, and the Bahama Islands.

On the reverse side is the Library Map of the World. The largest and most accurate map on Mercator's Projection ever produced. The political divisions are correctly defined and beautifully outlined in colors. The ocean currents are clearly shown and named. Ocean steamship lines with distances between important ports are given. A marginal index of letters and figures enables one easily to locate every country in the world. A series of short articles in alphabetical order is printed around the border of this map in large, clear type, containing valuable information concerning agricultural, mining, and manufacturing statistics, also the value of imports and exports in dollars. The area, population, form of government, and chief executive of every country in the world is given up to date, also the names of the capitals and their population. **The Inset Maps** are elegantly engraved and printed in colors. They are placed in convenient positions around the United States map, and will be invaluable to every person desiring a plain understanding of our possessions. An inset map of China on the World side of map adds to its value.

Two maps worth five dollars each, on one sheet, all for only \$1.50, sent by mail or prepaid express; or we will forward it free as a premium for sending us Three New Subscribers at \$1.00 each; or for \$2.00 we will send the Map and the American Bee Journal for one year. Address,

GEORGE W. YORK & CO.,

144 & 146 Erie Street, CHICAGO, ILL.

GENERAL ITEMS

A Good Yield of Honey.

I have a small apiary of 37 colonies. I started with two few years ago. Some seasons they have done fairly well, and in others producing but a very little comb honey.

This has been the best season that we have had for three years in this section. The two years previous to this there were very light flows of honey, and during this time many bee-keepers lost nearly half of their bees, most of the loss being due to moths; before being noticed the hive would be literally filled with large, white larvae, that would consume the honey, and even the comb. But, as I said before, this has been a fairly good season in this section, and I have taken from one colony 340 pounds of nice section honey, well filled and capped; besides 10 pounds in sections that were not filled or capped, making a total of 350 pounds. I would like to ask if this is not the best record that you have ever heard of from one colony; although out in California, where the honey-flow is better, and the seasons longer, they may beat this.

JOHN LENNEY.

St. Lawrence Co., N. Y., Sept. 14.

[Yours is certainly a good yield of honey, but we believe Mr. Doolittle once secured 506 pounds of honey from one colony in one season.—EDITOR.]

A Hive Roof and Shade.

Bees did well here until about July 1. July and August were so dry that they consumed a great deal more than they gathered during those two months. They gathered scarcely any pollen from the corn, which is generally a great source of pollen.

I will give a description of a roof for a beehive that I am using, and like it very much. Take barrel-staves from any barrel that has become useless for any purpose but kindling. Use one at each end crosswise of the hive to nail the other staves on. Then where the cracks are, nail on another stave, but is light and handy, and will turn the rain as well as the sunshine. Please do not understand that this is a lid or top for a hive, but a roof to turn the water and sun.

HARRY N. HARBOLT.

Clark Co., Ind., Sept. 9.

"Making" Natural Swarms.

In answer to Mr. Hasty's "Not unwise to hold the thing as an experiment until many brethren have had continued success in making all the bees stay" (page 569), here is a little experience I have had in that direction:

I started last spring with 41 colonies; I lived four swarms, knew of two or three going off, got one out of the rocks, so that I closed the season with 46 colonies; 6 or 8, however, for various reasons, did not do any good, either in honey or brood-rearing, for causes that are now rather stale, but is light and handy, and will turn the rain as well as the sunshine. Please do not understand that this is a lid or top for a hive, but a roof to turn the water and sun.

The first operation was quite successful; succeeding operations were equally successful, but having to allow the bees to rear their

Farm Wagon Economy.

The economy of this proposition is not all found in the very reasonable price of the wagon itself, but in the great amount of labor it will save, and its great durability. The Electric Wheel Co., who make this Electric Handy Wagon and the now famous Electric Wheels, have solved the problem of a successful, durable low-down wagon at a reasonable price.

ELECTRIC

This wagon is composed of the best material throughout—white hickory axles, steel wheels, steel bounds, etc. Guaranteed to carry 400 lbs. These Electric Steel Wheels are made to fit any wagon, and more practically a new wagon out of the old one. They can be had in any height desired and any width of tire up to 8 inches. With an extra set of these wheels a farmer can interchange them with his regular wheels and have a high or low-down wagon at will.

Write for catalog of the full "Electric Line" to Electric Wheel Co., Box 16, Quincy, Ill.

own queen, and not wanting to rush along until I could see how it would succeed, I waited to see the success of a previous operation before I tried the next. In this way time slipped by that I know I could have improved.

In these large colonies, after taking out the queen and a big, strong swarm, I had been enough left for several more, but I waited until they had a new queen in full swing before I attempted another. I thought if this strong remainder could rear a queen for themselves, perhaps a smaller number could, and I could divide faster, so I took out two swarms and left a third on the old stand, taking care that the queenless portion had something to rear a queen from; the colony left on the old stand being left comparatively the weakest, for some might return, and field-bees came in so that this one was soon as strong as any of the others.

Later in the season I was not so successful in taking out more than the queen and one swarm, the queenless portion either going with the queen or back to the old stand; but if I could have had a new queen to have run in with them, I think they would have been all right. Then, as time went by, I found the drones disappearing, and I was afraid the young queens might not be fertilized, and I halted somewhat; some I gave queen-cells.

Recently I found one colony with a good many drones—two frames nearly all drone-cells, and full of eggs, and one frame of worker-comb with just-hatched larvae, all of which seemed odd to me at this season, though it may be all natural.

I made my last division Sept. 14, putting in a cell about ripe with the queenless portion. In all I found the bees "staid" put, the queen almost invariably going immediately to work, and brood-rearing started off at once, the most trouble being to get new queens in that portion that was queenless. As I said before, I think if I could have had a new queen to have given at the time of the division it would have been better. I lost two of such new colonies, one that had a queen and one that had none, mainly, I think, because I did not get them home enough at the time of the division. I had plenty of honey in other hives, and ought to have kept closer watch and changed frames so all would have had enough, the main flow being over, and not enough coming in to keep them going.

If I could do it over, with the experience I now have, I could have at least half as many more as I now possess, which is 81. All seem to be doing nicely now. I expect to have to watch closer to see that all have feed, but even in winter in this climate we have days that it is safe to look into the hives.

During the main flow my colonies were big and strong, and gave me about three tons of extracted honey, and at its close I lost lots of bees to starve.

A. J. BURNS.
San Diego Co., Calif., Sept. 17.

Once More the Mulberry.

Oh, that wicked brother, Hasty! He, too, must needs consider his cunning little stomach, just like all horrid men. Hence, his greater faith in mulberry jam. "Ya, I believe me!"

Well, I shall not urge him, or any one else, to accept the views I have stated regarding the honey product from white mulberries. It is the privilege of all to doubt. Indeed, I esteem it a wise provision of Nature that we may feel uncertainties regarding many things if, happily, we are thereby stimulated to investigate, and thus lay bare the facts. If what I have written on the subject has to intelligent efforts to arrive at the exact truth.

BEST

Extracted Honey For Sale

ALL IN 60-POUND TIN CANS.

Alfalfa Honey

This is the famous
White Extracted
Honey gathered in
the great Alfalfa
regions of the Central
West. It is a
splendid honey, and
nearly everybody
who cares to eat
honey at all can't
get enough of the
Alfalfa extracted.

Basswood Honey

This is the well-
known light-colored
honey gathered from
the rich, nectar-
laden basswood bloss-
oms. It has a
stronger flavor than
Alfalfa, and is pre-
ferred by those who
like a distinct flavor
in their honey.

Prices of Alfalfa or Basswood Honey:

A sample of either, by mail, 10 cents, to pay for package and postage. By freight—two 60-pound cans of Alfalfa, 8 cents per pound; four or more cans, 7½ cents per pound. Basswood Honey, ½ cent more per pound than Alfalfa prices. Cash must accompany each order. You can order half of each kind of honey, if you so desire. The cans are boxed. This is all

ABSOLUTELY PURE HONEY

The finest of their kinds produced in this country.

Read Dr. Miller's Testimony on Alfalfa Honey:

I've just sampled the honey you sent, and it's prime. Thank you. I feel that I'm something of a heretic, to sell several thousand pounds of honey of my own production and then buy honey of you for my own use. But however loyal one ought to be to the honey of his own region, there's no denying the fact that, for use in any kind of hot drink, where one prefers the more wholesome honey to sugar, the very excellent quality of alfalfa honey I have received from you is better suited than the honeys of more marked flavor, according to my taste.

McHenry Co., Ill.

C. C. MILLER.

Order the Above Honey and then Sell It.

We would suggest that those bee-keepers who did not produce enough honey for their home demand this year, just order some of the above, and sell it. And others, who want to earn some money, can get this honey and work up a demand for it almost anywhere.

GEORGE W. YORK & CO., 144 & 146 Erie St., Chicago, Ill.

I shall feel abundantly repaid for the expression of my convictions.

Also, let me state that I sowed some of the white mulberry seeds the middle of last month (August), and that at this date (Sept. 20), the plants from those seeds are an inch high, and look vigorous. This is only another way of suggesting that the readers can as readily propagate their plants at a nominal cost for seeds. I hope to have seed to spare next July to give, with my compliments, to all bee-keepers, and to such others as may write for some. Postage is all that will be required.

DR. PEIRO.

78 State St., Chicago.

Golden Honey-Plant.

I send a honey-plant which I desire named. There is much of it growing here on the bottom lands, and it is the greatest honey-plant we have in this part of the country. The nectar flows in it for about one month. It grows about 4 to 6 feet high. The honey from it has a yellow cast.

Our bees did no good this year in storing surplus honey.

Coffee Co., Kan., Sept. 20.

J. L. BADER.

[The plant in question is the famous Golden honey-plant—*Actinomeris squarrosa*—and belongs to the great Composite family. It grows tall and branching in rich, loamy soil, and is a boon to the apiarist. Prof. Cook, in the "Bee-Keepers' Guide," page 371, mentions the plant as possessing great attraction for bees. Many other composite flowers are good honey-producers, such as the bonaset, asters, goldenrod, etc.—C. L. WALTON.]

Honey-Dew on the Hickory Leaves.

EDITOR YORK:—I send some shellbark hickory leaves for your inspection. They were plucked at 11 o'clock a.m., covered with honey-dew (!). For weeks the hickory leaves have been covered mornings with it, sometimes so thick it would run down and fall in big drops. The bees gather it industriously. Toward noon it dries up considerably, but I have some leaves on my desk that

have lain there till they are dry and brittle—over a week—and there is still honey (?) sticking on them. I have not found it on any other kind of leaves. It was light in color—about like white clover honey—and perfectly clear. It has been so long since we had any rain that I don't know when it was. Bees have done no good here this season.

C. W. MCKOWN.

Knox Co., Ill., Sept. 10.

[The leaves arrived while we were in Buffalo, but on our return the sticky sweetness could still be plainly seen on them. It must have been quite thick on the trees.—EDITOR.]

CONVENTION NOTICES.

Illinois.—The annual meeting of the Northern Illinois Bee-Keepers' Association will be held in the Court House in Rockford, Ill., on Tuesday and Wednesday, Oct. 15 and 16, 1901. All interested in bees are invited to attend.
Rockford, Ill. E. KENNEDY, Sec.

Utah.—There will be a meeting of the Utah Bee-Keepers' Association in the City and County Building, Salt Lake City, Utah, Oct. 5, 1901, at 10 a. m., to which all are cordially invited. Kindly inform other bee-keepers and send the addresses of your neighbor bee-keepers. We also desire the address of all county bee-inspectors. A full program in the interest of the industry will be presented. Send in questions. Among other questions it is desired to consider, is a union of interest (in the purchase of supplies and the disposing of bee-products at profitable rates. Yours in behalf of the bee-keepers,
E. S. LOVELY, Pres., J. B. FAGG, Sec.,
Salt Lake City, East Mill Creek.

HONEY AND BEESWAX

MARKET QUOTATIONS.

CHICAGO, Sept. 18.—No. 1 white comb honey is selling at 15c per pound, with occasionally a little more being obtained for fancy lots, which does not grade No. 1 selling at from 13c to 14c, with the light amber at 12c to 13c; dark honey of various kinds selling at 10c to 12c. Extracted in moderate demand at from 5c to 6c for the various grades of white; some fancy white clover and basswood bringing 7c; light amber ranging from 5c to 5 1/2 c; dark at 5c to 5 1/2 c. Beeswax firm at 50c to 51c.
R. A. BURNETT & CO.

CINCINNATI, Aug. 10.—The honey market is rather dull on account of the warm weather. Extracted sells only to manufacturers from 5c to 6c; better grades alfalfa water-white from 6c to 7c; white clover from 8c to 9c. Fancy white comb honey sells from 13c to 15c.
C. H. W. WEBER.

BOSTON, Sept. 27.—We quote our market as follows: Fancy white in cartons, 10c; A No. 1, 15c; No. 1, 14c. Extracted, white, 5c to 6c; light amber, 8c; amber, 6 1/2 c to 7c.
BLAKE, SCOTT & LEB.

ALBANY, N. Y., Sept. 19.—We quote: Fancy white comb, 10c; No. 1, 15c; mixed, 13c to 14c; No. 1 buckwheat or amber, 12c to 13c. Extracted, white 7c to 8c; light, 6c to 7c; dark, 5c to 6c. Beeswax, 28c to 29c.
H. R. WRIGHT.

OMAHA, Aug. 8.—New comb honey is arriving by express in small quantities from Iowa and Colorado, and selling at \$3.50 per car in retail way. California extracted honey is being offered carlots at 4 1/2 c per pound, f.o.b. California shipping points, but we have not heard of any sales having been made here yet. The production of extracted honey seems to be quite large this year in Colorado, Utah and California.
PEYCKE BROS.

NEW YORK, Sept. 10.—Comb honey is now beginning to arrive in large quantities, and, as a rule, quality is fine. The demand is good, and we quote as follows: Fancy white, 14c to 15c; No. 1, 13c; No. 2, 12c; and amber, 11c. No buckwheat is on the market as yet, but are expecting same within a week or two. Extracted is selling slowly, with plenty of supply, at 5c to 6c, according to quality, and Southern in barrels at from 5c to 6c per pound. Beeswax dull at 27c.
HILDRETH & SEIGELKEN.

DES MOINES, Aug. 7.—There is very little doing here in new crop of honey. Some small lots of near-by produced comb honey are on the market and selling in a retail way at \$3.50 to \$3.75 per case. We do not look for much trade in this line before Sept. 1. Our market does not consume a great deal of extracted honey.
PEYCKE BROS. & CHANEY.

DETROIT, Aug. 12.—Fancy white comb honey, 14c to 15c; No. 1, 13c to 14c; No. 2, 12c to 13c. Extracted, white, 6c to 7c. Beeswax, 28c to 29c.
M. H. HUNT & SON.

BEAUFORT, Aug. 10.—Quite a good demand for fancy honey, 16c to 17c, and lower grades, 13c to 14c, old neglected. Advise moderate shipments only of new as yet.
BATTERSON & CO.

SAN FRANCISCO, Sept. 4.—White comb, 10 to 12 cents; amber, 7 1/2 c; dark, 6c to 7c; cents. Extracted, white, 5 1/2 c to 6c; light amber, 4 1/2 c; amber, 4c to 5c. Beeswax 26c to 28c.

Arrivals and spot offerings are of rather moderate volume, but there is as much or more on market than can be conveniently or advantageously placed. To secure liberal wholesale custom, prices would have to be shaded in favor of buyers. In a word, the way for producers of desirable lots slightly higher figures than are quoted are realized.

KANSAS CITY, Sept. 14.—Up to the present time only small lots of new comb honey have been on the market, and these met with ready sale on the basis of 15c to 16c per pound for fancy white. For next week heavier receipts are expected and quotations are which would be equal to about 14c to 15c; the demand being quite brisk, a firm market is anticipated. Inquiries for extracted are a little more numerous, but large buyers still seem to have their ideas too low. In a small way 5c to 6c is quotable.

RED CLOVER QUEENS

BLACK ROCK, N. Y., Sept. 3, 1901.

FRIEND ERNEST:—I will try and tell you what you want to know about that queen. I got
her of you in 1899 as a premium with GLEANINGS. I never saw a small colony of bees build up
as that one did. In the spring of 1900 they came out in fine shape, wintered perfect. I raised them
up in May and gave them 8 frames more so the queen would not want for room. I never saw such
a colony of bees as they were in June, and they were actually storing honey when other bees in
my yard were starving. No! they were not robbing. I never saw those two best colonies of mine
trying to rob. **THEY CERTAINLY WORK ON RED CLOVER.** This is no guesswork, as I
have seen them. As you know, the past two seasons have been very poor, and what honey my
bees did get in 1900 candied soon after cold weather set in. I packed this colony in a chaff hive
and left them out, thinking that such a strong colony would winter perfect. The snow came on
the middle of November, and those poor bees never a fly until the last of March or the first of
April. When warm weather at last came I thought they were dead, as they did not seem to be fly-
ing much, so I did not pay any attention to them until in June. I noticed they were working a
little, so I opened up the hive and found them in the upper story. I took the lower story out and
left them in the one body. The queen was laying nicely, and I thought they would make a good
colony to winter. Along the last of July I noticed that they needed more room. I gave them a
super, 24 boxes, and in a few days they had it full. They have made 72 boxes of as nice honey as
you ever saw, and are drawing out some starters now, Sept. 2.

Very truly yours, GEO. B. HOWE.

A Celluloid Queen-Button is a very pretty thing for a bee-keeper or honey-seller to wear on his coat-lapel. It often serves to introduce the subject of honey, and frequently leads to a sale.

NOTE.—One reader writes: "I have every reason to believe that it would be a very good idea for every bee-keeper to wear one of the buttons as it will cause people to ask questions about the busy bee, and many a conversation thus started would wind up with the sale of more or less honey; at any rate it would give the bee-keeper a superior opportunity to enlighten many a person in regard to honey and bees."

The picture shown herewith is a reproduction of a motto queen-button that we are furnishing to bee-keepers. It has a pin on the underside to fasten it.
Price, by mail, 6 cents; two for 10 cents; or 6 for 25 cents. Send all orders to the office of the American Bee Journal.

Langstroth on... The Honey-Bee

Revised by Dadant—1900 Edition.

This is one of the standard books on bee-culture, and ought to be in the library of every bee-keeper. It is bound substantially in cloth, and contains over 500 pages, being revised by those large, practical bee-keepers, so well-known to all the readers of the American Bee Journal—Chas. Dadant & Son. Each subject is clearly and thoroly explained, so that by following the instructions of this book one cannot fail to be wonderfully helped on the way to success with bees.

The book we mail for \$1.25, or club it with the American Bee Journal for one year—both for \$1.75; or, we will mail it as a premium for sending us THREE NEW subscribers to the Bee Journal for one year, with \$3.00.

This is a splendid chance to get a grand bee-book for a very little money or work.

GEORGE W. YORK & CO.
144 & 146 Erie Street, CHICAGO, ILL.

—THE— The Bee-Keeper's Guide; Or, Manual of the Apiary. —BY— PROF. A. J. COOK.

460 Pages—16th (1899) Edition—18th Thousand—\$1.25 postpaid.

A description of the book here is quite unnecessary—it is simply the most complete scientific and practical bee-book published to-day. Fully illustrated, and all written in the most fascinating style. The author is also too well-known to the whole bee-world to require any introduction. No bee-keeper is fully equipped, or his library complete, without THE BEE-KEEPER'S GUIDE.

This 16th and latest edition of Prof. Cook's magnificent book of 460 pages, in neat and substantial cloth binding, we propose to GIVE AWAY to our present subscribers, for the work of getting NEW subscribers to the American Bee Journal.

Given for TWO New Subscribers.

The following offer is made to PRESENT subscribers only, and no premium is also given to the two new subscribers—simply the Bee Journal for one year:

Send us TWO NEW SUBSCRIBERS to the Bee Journal (with \$2.00), and we will mail you a copy of Prof. Cook's book FREE as a premium. Prof. Cook's book alone sent for \$1.25, or we club it with the Bee Journal for a year—both for only \$1.75. But surely anybody can get only TWO NEW SUBSCRIBERS to the Bee Journal for a year, and thus get the book as a premium. Let every body try for it. Will YOU have one?

GEORGE W. YORK & CO.,
144 & 146 Erie Street, CHICAGO, ILL.

The Novelty Pocket-Knife.

Your Name and Address on one side—Three Bees on the other side.

[THIS CUT IS THE FULL SIZE OF THE KNIFE.]

Your Name on the Knife.—When ordering, be sure to say just what name and address you wish put on the Knife.

The Novelty Knife is indeed a novelty. The novelty lies in the handle. It is made beautifully of indestructible celluloid, which is as transparent as glass. Underneath the celluloid, on one side of the handle is placed the name and residence of the subscriber, and on the other side pictures of a Queen, Drone, and Worker, as shown here.

The Material entering into this celebrated knife is of the very best quality; the blades are hand-forged out of the very finest English razor-steel, and we warrant every blade. The bolsters are made of German silver, and will never rust or corrode. The rivets are hardened German silver wire; the linings are plate-brass; the back springs of Sheffield spring-steel, and the finish of the handle as described above. It will last a last-time, with proper usage.

Why Own the Novelty Knife? In case a good knife is lost, the chances are the owner will never recover it; but if the "Novelty" is lost, having name and address of owner, the finder will return it; otherwise to try to destroy the name and address, would destroy the knife. If traveling, and you meet with a serious accident, and are so fortunate as to have one of the "Novelties," your POCKET-KNIFE will serve as an identifier; and in case of death, your relatives will at once be notified of the accident.

How appropriate this knife is for a present! What more lasting memento could a mother give to a son, a wife to a husband, a sister to a brother, or a lady to a gentleman, the knife having the name of the recipient on one side?

The accompanying cut gives a faint idea, but cannot fully convey an exact representation of this beautiful knife, as the "Novelty" must be seen to be appreciated.

How to Get this Valuable Knife.—We send it postpaid for \$1.25; or give it as a Premium to the one sending us THREE NEW SUBSCRIBERS to the Bee Journal (with \$3.00). We will club the Novelty Knife and the Bee Journal for one year, both for \$1.90.

GEORGE W. YORK & CO.

St., Chicago, Ill.

☞ Please allow about two weeks for your knife order to be filled.

For some weeks back we have been having men on the Pacific coast make a careful canvass; and it is very evident that the crop is light in comparison with those of some of the big years. I do not believe there is an aggregation of responsible producers anywhere in California who would guarantee to-

day to deliver more than 25 cars, and as nearly as we can estimate they are holding back till these exaggerated reports have run their course, and the market seeks its natural level. It is most unfortunate that these cautions should have been started at this time; for this is usually the *very* season for disposing of honey, and it may take months to correct the false impression.

The situation in the East, briefly told, is this: There is actually less comb honey produced this year than last; and what there is, seems to be of an inferior grade. We have advocated in these columns repeatedly that bee-keepers are running too much for extracted honey in the East; at least 2½ to 3 times as much as extracted for a like quality. The market on extracted has become a little unsettled, owing to aforesaid "hears" who not only love honey, but are contriving to get it for nothing. Yes, we are even told that the markets of the East were being glutted; but some of our friends went into some of those markets to buy honey in car lots. Do you believe they could get any? There was not any in sight. To state the matter fairly, there is probably a fair crop of extracted honey of Eastern production; and the prices on extracted will, therefore, rule about the same as last year, for the same season of the year. Colorado honey is evidently being held until the market recovers itself from these conflicting statements. The crop has been lighter, and so far offerings that have been very meager are as high or higher than a year ago. There is only a moderate crop in Arizona—about 25 cars all told; and this is likewise being held for the same reason. Texas, one of the big honey States, will show up well, but much of its product will be marketed at home, while Arizona honey, a large portion of it, will have to be sold in the East.

Returning to California, latest advices show that the season has been a flat failure in the central portions of the State. Our men can not find more than three-car loads all told. In Southern California it would be a large estimate to allow for 75 cars; if the general reports we get are true, and they come from men who are not inclined to "bull" the market. I know they are very close to the truth, because I was through much of that territory myself, and perhaps two-thirds of the crop had been harvested.

I shall send copies of this statement, prepared this day, to all the large buyers whom I believe to be reliable and honest, and will seek their advice and help.

LATER.—Since the above was written one of the best bee-keepers in California, who was sent by a San Francisco firm through the best honey country around Los Angeles, to get samples and quantities of honey, writes, after a careful canvass, that he could scarcely find, all told, 50 tons (20 cars), and that he is informed by reliable parties, that the crop further south and east is very light. Moreover, he finds that some of the buyers, in the papers at Los Angeles, credit to a bee-keeper as many cars of honey as he has in tons. As to prices, the honey is being held firm at 5 cents or more. E. R. ROOR.

Like Messrs. Barnett & Co., we hesitate to advise those of our readers that have honey to sell, what to do about marketing it. And yet we think we are safe in saying that whenever you can get as good prices as those of last year, it would be well to accept them very promptly.

Having said that, we may also venture the opinion that before honey is higher in price again, it will likely go lower than the prices quoted now. This we believe because of the feeling that more honey is being held back by bee-keepers this season than in many a year before.

It is exceedingly unfortunate that there seems to be no reliable way in which to get at the exact amount of honey produced. Were that a possibility, the matter of prices could be more easily be controlled.

A Phase of In-breeding Among Bees—in which there is a difference as compared with other stock—deserves consideration. Where breeders of cattle practice in-breeding for the sake of fixing certain characteristics, they seem to prefer mating a heifer to her father rather than to her brother. There is a good reason for this. The father and mother of the heifer being of unrelated stock, the heifer is not of the same blood as either, but may be said to have half the blood of each; so when the heifer is bred to her father there is not as close in-breeding as when bred to her brother, which is of the same blood as herself. Now if we have a certain queen of superior blood from which we rear young queens, and then allow these young queens to mate with drones from the same mother, it might look, to a careless observer, the same as breeding the heifer to her brother. But partogenensis must be taken into consideration, and in reality it is the same as breeding the heifer to her father. For the drone is not of the mingled blood of his mother and the drone with which she mated, but he is of the same blood as his mother. If this year we stock our apiary with young queens from a certain queen, and the next year rear young queens again from that same mother, allowing them to meet drones of the queens reared this year, we will have practically the close in-breeding of brother and sister that would obtain in cattle-rearing, but the mating of a queen and drone from the same mother will not be so close breeding.

Weekly Budget.

THE CHICAGO BEE-KEEPERS' ASSOCIATION will hold its next semi-annual meeting on Thursday, Dec. 5, instead of Thursday, Nov. 7. This is the result of a meeting of the executive committee on Oct. 3. The date a month later was decided upon because of the Live Stock Exhibition to be held in Chicago Nov. 30 to Dec. 7. Low railroad rates will then prevail, which should help greatly to swell the attendance of bee-keepers.

Look out for a fuller notice by Secretary Moore, next week. In the meantime, begin to plan to be in Chicago Dec. 5. No effort will be spared to make it the largest and best meeting of bee-keepers in 1901 the recent Buffalo convention not excepted.

APIARY OF MR. C. G. HEALY. In writing us about his bee-keeping, Mr. Healy had this to say (see page 618):

On May 22, 1900, I moved three small apiaries, one consisting of 52 colonies, another of 41, and another of 15, from Walworth Co., Wis., to Wood county, arriving at my destination on May 24.

Owing to poor seasons in Walworth county, and the losses sustained in moving the apiaries, they were in very poor condition when I arrived here. But as the season was very favorable the 108 colonies increased to 169, and I shipped two tons of comb honey.

I put the bees in winter quarters, Nov. 25, in an outside cellar. After regulating the ventilation to what I supposed to be right, I left them until spring, returning March 20, when I found the temperature to be 71 degrees in the cellar, and the loss at the outset 9 colonies.

But because of the high temperature in the cellar during the winter many of the bees left their hives, clustered on the ceiling, and of course were lost. As a result I lost 63 colonies from spring dwindling, a total loss of 3 colonies more than the increase of last year. Those that are left are doing well, and at present there is a good outlook for a fair crop. C. G. HEALY.

Wood Co., Wis., July 8.

MESSRS. SALYER, HYDE AND SCHOLL—The officers of the Texas Bee-keepers' Association—were shown on page 609. Since then we have received a few personal items concerning each, which, unfortunately, were delayed so they could not appear in the issue with the pictures.

All three of those in question are yet young men, Mr. Salyer being the only one married. Messrs. Hyde and Scholl are just out of their teens, and not yet of age; nevertheless all three have done a great deal for Southern bee-keepers, and perhaps there are not many such "youngsters" that have gained so much fame.

Mr. Salyer was vice-president of the Central Texas Bee-keepers' Association the last two years, until elected president of the new State association at the last meeting. He has been in the bee-business for many years, combining it with farming and stock-raising, as he has fine herds of cattle.

Mr. H. H. Hyde has been in the bee-business ever since nine years old, helping his father during summer and attending school during winter. As the junior member of O. P. Hyde & Son, and at the head of the queen-rearing department of that firm, besides being an interesting and instructive correspondent to the bee-keepers, he is already well known to the bee-keepers of our land. He is of a temperate disposition, abhorring the use of all intoxicants and tobacco. Mr. Hyde is a member of the Baptist church. At home he has held several minor offices of trust, and has been assistant secretary of the Central Texas Bee-keepers' Association, at the last meeting elected vice-president.

Mr. Louis Scholl has been actively engaged in apiarian association work for several years. At the age of 17 he was chosen as the association's secretary-treasurer, and to keep him as such, certain clauses in the constitution of the association, restricting an officer to only one year's term, had to be ruled out. He has held his office ever since that time.

His bee-keeping career began while yet quite young and on account of his studious habits, he has mastered more about the honey-bee than many another of his age; and it he lives the bee-world may yet hear more about him. He has already made great strides towards enviable notoriety, especially among the bee-keepers of the South. His contributions to apicultural literature have appeared from time to time.

Mr. Scholl is a total abstainer, and an earnest Christian.

Under the able, conscientious management of these three men, the Texas State Bee-keepers' Association should flourish "like the green bay tree."

APIARY OF MR. C. L. KING.—The picture shown on page 641, was taken from the south-east end of Mr. King's bee-yard. He and his little boy are standing near the center, his father at the right, and his brother at the left. Mr. King has on a bee-veil of his own make. He never wore a veil until this season. Mr. King has kept bees since 1893, and likes it well. He has about 75 colonies, but the past season has been the poorest for honey that he has ever seen in Tennessee.

Convention Proceedings.

(Continued from page 631.)

Report of the Texas Bee-Keepers' Convention.

BY LOUIS SCHOLL, SEC.

BEGINNERS RUINING THE HONEY-MARKET.

"How can beginners best be educated how not to ruin a market for those more experienced?"

D. C. Milam said the selling of honey is the most important subject connected with our industry, the important part being that it depends upon that which brings the cash on which success is based. By producing a first-class article, it should be put up in the best marketable shape, and so as to attract the attention of buyers. The price seems to be almost universal over Texas. Beginners should be taught all this; especially when an experienced bee-keeper has a market established, he should see to the beginners. Teach them. Either help them along, buy their honey, or help them to establish a market for it. When beginners have a surplus of honey during a good year, *they just want to get rid of it*, and then they do harm through their ignorance.

The demand for Uvalde honey is so great that it has never been filled. Of course, while their honey is of such fine quality as to have such a wide reputation, they also have some very inferior honey, from a few localities. Some of it is not even edible, and if it should be put on the market, it would ruin it. Such must never be done, for any person that should happen to eat such inferior stuff would lose all desire for any more honey. Some make a big mistake by extracting too soon, before the honey is well ripened. He cited a case where some honey was bought in barrels, by a dealer who handled honey extensively, and opening a barrel at one time, the vile stuff shot out all over his person and dress, and made him feel so badly that he could not even bear to think about honey—so much so that *not one pound* did he ever buy again. Besides this, he gave several other experiences.

He also spoke about organization and the prices of honey. Then all the honey could be bought for a little less per pound to sell again for enough to make sufficient for the trouble, and thus it would save much to the experienced bee-keeper, especially those that have a good market for their product. He said that all honey put up for sale should be a first-class article, and every package should contain the name and address of the producer, to show that it is such. He also told of a firm that bought and sold any kind of honey, just as it would happen along. But that firm does not sell any more now.

W. O. Victor's experience has been quite varied. He related a case where a large bee-keeper sold his honey, of fine grade, for 10 cents per gallon less than wholesale prices, and that in his home market, which ruined his entirely. He tried to buy the honey from this bee-keeper, offering him the real wholesale price, which was 10 cents more per gallon than his wholesale price, but he refused to sell, for the reason that he had to supply his customers with honey.

WHAT IS THE BEST RACE OF BEES?

W. O. Victor said he believed he was perhaps not well informed on the different races of bees, he having begun with the Italians; they treated him so well that he stayed with them. He never had any other race in his yards, and hardly knows which is the best race of bees. He told of the many "strains" of Italians, and how they could be bred to possess some of the good qualities. He spoke about certain strains of Italians, the bees of which start to run all over everything whenever a hive is opened. These he calls "race-horses" on account of their running, and thinks it the proper name for them. These he culls out as soon as he can.

The dark, leather-colored Italians he thinks the best, as they are the gentlest bees, sticking to their combs, and for honey-gathering they are the best all-around bees, always ready when honey is to be had, watching even for the buds to open, so that the first sip of nectar might be taken.

Some of the other strains are so vicious that he is afraid of them, for the reason that they are dangerous.

He also touched on the long-tongue hobby and believes there is something in it, as there are so many flowers with long corolla-tubes, requiring a longer tongue-reach to get all of the nectar out of them. He has tested bees possessing long tongues, and although some with longer tongues did no better than some with shorter tongues, yet he thinks that long tongues are no disadvantage, for those with the longest tongue-reach outstripped anything in his yards in storing honey. The three-band Italians averaged longer tongues; while the goldens have some of the very shortest, blacks not excepted.

O. P. Hyde—What is meant by different strains of Italians? It seems that there are only the three-band Italians and the "Golden" Italians.

Mr. Victor meant by different strains of Italians, the difference of management and selection by certain breeders, causing a different strain of Italians in the end; by always selecting another that produce certain traits, would cause a strain, in the end, possessing those traits, and different from other strains bred on other lines.

Others spoke on this line, and the great difference there is in the daughters of the same mother.

Mr. Atchley said that much depends upon locality, as to which is the best race.

For all-around purposes the three-band Italian is the bee, and especially for his locality, if restricted to a pure race. Cyprians and Holy-Lands he thinks best for localities where strong colonies of bees are needed through the greater part of the year, as their queens are so prolific that they keep up rousing colonies all through the season. He is an old friend of the three-band Italian, but not for comb honey, as they so crowd out the queens in the brood-nest. They are all right for only one flow, as a rule, for, by crowding out the queens, there is no force of bees to secure the honey of later flows. Hence, for a locality with more than one flow, queens are desired that keep a "standing army" all the time, and this will be a race of bees with queens so prolific that, if a queen is removed from a colony, laying workers will take her place at once, their desire for brood-rearing being so strong. These would be Holy-Lands or Cyprians; and, besides, he thinks that their wings are stronger, and the bees have more power, thus making them better for gathering honey, than others.

Questions were asked, what to do when bees crowd out the queen in the brood-nest. Some advised putting empty combs in the middle of the brood-nest, between combs of brood, to let the queen lay in them. Others, again, objected to this, as such combs were sometimes filled with honey even there.

Mr. Atchley cited the experience of his son, Charlie, who runs his apiary of three-band Italians. He had had trouble with these putting all the honey into the brood-combs instead of the supers above. So he tried a new idea, that of putting the super *below* the brood-nest, and there it was.

So Mr. Atchley thinks that if we might strike out the right way, we might succeed all right with the three-band Italians.

H. H. Hyde asked if a cross between the three-band Italians and Holy-Lands or Cyprians would not be a good one. Mr. Atchley answered that it would.

L. Stachelhausen said that it took different races for different localities, the three-band Italian not being good for his place, as there are not enough bees left for the flows that follow the first one. It might be best to cross them.

H. H. Hyde told of his experience with different races and their average yields, the best being from Holy-Lands. The Italians choked the brood-nests too much.

Mr. Victor said that plenty of room given during slow flows does not give any trouble. Supers should always be given a little ahead of time for the flow to begin, and the brood in the brood-chamber should extend from side to side, so the bees are bound to store above. Then always give a little more room than needed.

MISCELLANEOUS MATTERS.

Upon motion of Mr. Davidson, it was decided to send four representatives to Buffalo, N. Y., in September, to represent the Texas Bee-Keepers' Association, at the meeting of the National Bee-Keepers' Association. Udo Toepferwein, G. F. Davidson, Louis Scholl and H. H. Hyde were elected as such representatives.

W. O. Victor was appointed a committee of one to prepare a program for the next meeting.

The committee on "Resolutions and Petitions" handed in their report, which was adopted.

The South-Texas Bee-keepers' Association, meeting in conjunction with the other associations, asked that they be allowed sufficient time to transact some of the association's business, and to elect officers for the ensuing year; also to decide upon a place to meet the next year. Officers elected for the coming year: E. J. Atchley, president; W. O. Victor, vice-president; W. H. Lewis, secretary.

The next place of meeting will be at Beeville, Tex., on the first Wednesday and Thursday in September, 1902.

The committee judging the bee-keepers' exhibits handed in their report of awards, as follows:

AWARDS AND WINNERS.

COLLEGE STATION, July 25, 1901.

Rig. Louis Scholl, Secretary-Treasurer, Texas Bee-Keepers' Association.

Single-comb nucleus, Golden Italians, 1st prize, \$2.50—O. P. Hyde & Son.

Single-comb nucleus, 3-band Italians, 1st prize \$2.50—O. P. Hyde & Son.

Single-comb nucleus, Holy-Land, 1st prize, \$2.50—O. P. Hyde & Son.

Sweepstakes on bees, greatest number of different races, 1st, \$100—package of valuable articles—O. P. Hyde & Son.

Best section comb-honey exhibit—1st, 5 cases honey-cans—G. F. Davidson; 2d, Golden breeder queen—J. B. Salyer.

Best sample cake section honey, Special, 50 cents—G. F. Davidson.

Best bulk comb-honey exhibit—1st, 5 cases honey-cans—G. F. Davidson; 2d, Golden breeder queen—J. B. Salyer.

Best sample bulk comb honey, Special, 50 cents—G. F. Davidson.

Best extracted honey exhibit—1st, 5 cases honey-cans—G. F. Davidson; 2d, Holy-Land breeder—J. B. Salyer.

Best specimen extracted honey, Special, 50 cents—G. F. Davidson.

Best exhibit beeswax, 1st, solar wax-extractor—Louis Scholl; 2d, Apiary tool-chest—J. B. Salyer.

Best sample cake bright yellow wax, Special, 50 cents—Louis Scholl.

Best display honey-plants, pressed and mounted, 1st, Brass Higginsville smoker—Louis Scholl; Special, 50 cents—Louis Scholl.

Best section comb-honey exhibit—1st, one-comb honey hive—G. F. Davidson; 2d, cash prize of \$10—O. P. Hyde & Son.

Largest and best display apiarian implements, 1st, cash prize, \$5.00—Udo Toepperwein; 2d, Foundation fastener—O. P. Hyde & Son.

Sweepstakes, largest, best and most interesting and instructive exhibit, all things considered, 1st, Cowan honey-extractor—Udo Toepperwein; 2d, cash prize of \$10—O. P. Hyde & Son.

Best exhibit bee-keepers' supplies, 1st, blue ribbon—Udo Toepperwein; 2d, red ribbon—O. P. Hyde & Son.

The other business was then all settled, and just before adjournment, upon the entering into the room of the bee-keepers' section of the Farmers' Congress, of Prof. Connell, he was presented with a case of beautiful white section comb honey, by the Association, from Mr. G. F. Davidson, with very appropriate words by Mr. Atchley. Prof. Connell accepted the same with words showing very pointedly how his kindness was appreciated by him, and he thanked them all for their kindness.

The convention then adjourned.

J. B. Salyer, Pres.

Louis Scholl, Sec.

other similar topics, do not seem to know so very much, after all; and while they have succeeded very well in criticising *what is done*, they have lamentably failed to show *what ought to be done*.

To-day it is raining, and I have nothing pressing to do, so I will take my chances and dabble into the subject, running the risk of showing my own ignorance just for the fun of it.

HEREDITY.

It is hardly necessary to say that heredity is a short word to state the fact that any living being is similar to his father and mother, or ancestors. So a cat is a cat similar to his ancestors. A plant of corn is similar to those that furnished the grain from which it grows, and the pollen which fecundated the grain. (In writing this I use common words in place of scientific terms, as far as possible).

VARIABILITY.

But the offspring is never the exact image of its ancestors. There is always some minor difference, sometimes one way, sometimes another, sometimes in one particular, sometimes in another—in size, color, different aptitudes, etc. It is that disposition that enables us to improve our stock. For instance, suppose we want a stock of cattle especially good for producing milk, we first begin by choosing the best milking cow procurable, and a bull a descendant also of good milking stock. In virtue of heredity, their descendants will be generally better milk-producers than any kind of cattle taken at random. In virtue of the variability, some will be better, and some not so good, some may be even better than their immediate ancestors, and some may be worse. We choose the best, those, if possible, better than their immediate ancestors, and repeat the process again and again. Eventually we will get a stock superior in aptitude to produce milk.

It is almost needless to say that all our noted breeds of stock—cattle, horses, chickens, dogs, etc.—have been produced, I might say created, by that process.

SURVIVAL OF THE FITTEST.

This is called a theory and often criticised or made fun of. But it is a fact, not a theory. Let me give some examples: Suppose some deer were put in a country where there are wolves. Suppose some very fleet on foot and some quite slow in running. The wolves will undoubtedly catch up with and kill the slow runners. The fleet footed will escape and breed. The result is that the next generation will average a better running stock. Of these, again, the slowest will be destroyed, the quickest remain. The result is that eventually a swift-running stock will be the result.

Take the quails and partridges. They may have been of any and all colors at the beginning. But the bright-colored ones were the easiest to see, and were caught by the hawks and other enemies. The brown and gray remained. The striped ones, as we see them now, are the least distinguishable from the brown earth and dead grasses, and finally remained alone. In domesticity, where all are protected, all colors stand an equal chance, except what choice the breeder may make.

ACQUIRED QUALITIES.

Not only the peculiarities inherent to the animals themselves at their birth, but also those acquired, are, at least to a certain extent, transmitted to their offspring. Take, for instance, the pointer dogs. The first were evidently trained to that mode of hunting birds—a very unnatural one. Their descendants, or rather some of them, inherited that disposition, at least, to some extent. The best were chosen, and more thoroughly trained, and the process pursued until now we have a breed of dogs in which it has become a second nature. There is no doubt that the thoroughly trained race-horse stallion transmits to his offspring his acquired qualities as well as those he possessed at his birth.

TRANSMISSION.

There are some laws governing the transmission of faculties and peculiarities from ancestors to descendants.

1. The same circumstances and environments tend to preserve the characteristics of animals from generation to generation, while a change will increase the tendency to variations.

2. This can be expected if we consider that the peculiarities of the animals were formed under those circumstances and best adapted to them in virtue of the law of the survival of the fittest. But let the animal be put in a

Queen-Breeding—A Review of the Subject.

BY ADRIAN GETAZ.

JUST now, in some bee-papers, a certain class of critics have chosen to criticise our queen-breeders severely, intimating that they don't know the fundamental principles of the art. Some have even intimated that a college course of study should have been taken, or at least a full study of Darwin, Huxley, etc. Exactly what advantage a college education in Greek, Latin, baseball and higher mathematics would be to a queen-breeder, has not been shown. It is even questionable if a full knowledge of Huxley's and Darwin's theories concerning the "Origin of Species" and "Descent of Man" would be of any use at all.

Again, the fact that our leading queen-breeders are not filling the bee-papers with learned (?) contributions on the subject, is not at all a proof that they are a lot of ignoramuses. Some of them undoubtedly know a good deal more than their critics suspect. The fact is, that these critics who speak so learnedly (?) about in-breeding, and

different position—for instance, a wild animal be domesticated—and variations in size, color, disposition, etc., will appear at once.

3. The more alike the father and mother, the more strongly and surely will their characteristics be transmitted to their offspring. And if they are very different, all sorts of variations may be expected.

The more *fixed* the characteristics and peculiarities, the more surely will they be transmitted. A "sport"—that is, an animal or plant showing some extraordinary peculiarity—is not at all sure to transmit it to its descendants, while the "fixed" qualities will nearly always be transmitted.

A fixed characteristic is one that has been transmitted from generation to generation either through the natural operation of the survival of the fittest or through the choice of the breeder.

IN-BREEDING.

That is, breeding between close parents or relatives. This is said to be injurious to vitality. The fact is quoted that in natural process of reproduction of plants and animals, in-breeding is avoided. On the other hand, all our best breeds of horses, cattle, fowls, etc., have been obtained by in-breeding. Numbers of bulls and stallions have done service as long as they lived, with their own mothers, grandmothers, daughters, granddaughters, etc.

One thing is certain, in breeding from close relatives, we breed from animals having the same characteristics and same peculiarities, and, according to the above rules, such will more likely be transmitted, and even intensified; for the *fixing* of a characteristic generally intensifies it. Now any defect which that breed may have, will thereby be fixed and intensified until it may eventually endanger or destroy the very life of the animals themselves.

INFLUENCE OF THE MALE.

In breeding horses, cattle, etc., it is found that the male has more influence on the offspring than the female. This is due in a great measure, if not altogether, to the fact that the male used is of a superior stock, with qualities better fixed and more intense than those of the females. If the process was reversed, that is, if the females were of the improved stock, and the males of the common stock, the reverse would probably take place. In the human race we do not see that the children inherit more characteristics from their father than from their mother.

INFLUENCE OF THE FEMALE.

The horse-breeders tell us that the male gives the qualities and the female the size. That is true, more or less, of all the animals that are developed in the mother's womb, but more of the horse than any other.

All those familiar with horse-raising know that a colt at his birth has nearly the full length of his legs; and that when full-grown his height (if he has not been stunted by lack of food or other hindrance) is about twice the length of his fore legs. It is easy to see that the colt born of a large mare has a start at his birth that he will keep during all his growth.

In plants and animals born of eggs or seeds, such an advantage does not occur.

In bees, the size is limited also by the size of the cell. It is a well-known fact, that drones born in smaller cells than the regular drone-cells are smaller in proportion to the size of the cells.

AS TO BEES.

In our attempts to improve our races of bees, we have to meet several difficulties that do not occur in other lines:

1. We have not the same control of the reproducers. If we desire to improve a herd of cattle we have the choice of the very individuals. We choose the best cow, and a bull descended from a superior stock. In improving our stock of bees, we want to improve the qualities of the workers. But we can not use the workers themselves. We have to fall back on their mothers, and use for reproduction drones and queens whose mothers have produced good workers, and take our chances.

2. We have only an imperfect control of the drones, and if we could breed from an individual drone of our choice, how could we tell that this drone would give better workers than that one? There is nothing to show. At best we could eliminate the weakest and undersized one. The only point where "hand-picking" of drones could help is in regard to color. The yellowest drones will undoubtedly produce the yellowest workers.

3. We are to work in the same line as Nature. In improving cattle, for instance, in getting up a good milking stock, we are developing a quality that in the wild state was completely undeveloped, hence we can obtain wonderful results. In the wild state, the animals (something like the Texas steers) have developed chiefly hardness, health and strength. If we were to take the Texas stock and try to increase the same qualities of hardness, strength, etc., we would make but little headway, because Nature has already developed them almost, and perhaps up, to the limit attainable.

In bees, what we want chiefly is hardness and honey-gathering qualities; that is, the very qualities that Nature has been developing for thousands of years, and we may expect that the limit has been nearly reached, if not altogether. We may perhaps increase the size of the bees and length of tongue.

CONCLUSION.

After all is said and discussed, all that is to be done is to get the queens and drones from the very best colonies obtainable, and rear the cells under the most advantageous conditions of warmth, feed, etc. It is needless to say that undersized or defective queens (and, if possible, drones) should be rejected.

That's all.

Knox Co., Tenn.

Size of Hives Not Necessarily in Accord With Laying Capacity of Queen-Bees.

BY G. M. DOOLITTLE.

A CORRESPONDENT writes thus: "I would like your opinion regarding the size of hive to use. Should I adopt the eight-frame Langstroth hive, so generally recommended, the same would, if entirely occupied with worker-comb, contain about 1168 square inches, and give about 85,000 cells. From this we must deduct at least ten percent of the space for the usual supply of honey and pollen, leaving about 52,500 cells. Allowing 21 days from the egg to the time the bee emerges from its cell, and one day for the bees to clean the cell and for the queen to lay in it again, we have an average of about 2400 cells for the queen to fill per day. Now, is 2400 eggs the utmost daily laying capacity of a queen in a strong colony? If not, should any queen be restricted to that amount when she could and would lay more? I ask these questions to help me determine what size of hive to build the coming winter. Please answer in the American Bee Journal, so it will appear in time for me to decide what size to make my hives."

I did not know that it was necessary to make our hives, as to size, to accommodate the prolificness of the most prolific queens, nor do I so think. Suppose that a queen could lay 5000 eggs daily, on an average, as some think possible. What is the price or worth of those eggs? Does the sum and substance of bee-keeping depend upon keeping all queens employed at egg-laying to their fullest capacity? Bees, when they come on the stage of action at just the right time, are very valuable, but eggs are of no value, only as they tend in the direction of producing these valuable bees. Aye, they tend toward positive disadvantage, and, to take away the value we already have, only as they look toward the end of producing the required bees in the field at the time of the honey harvest. Here is a point often lost sight of by the large-hive advocates.

Eggs cost practically nothing; but as soon as the bees begin to perfect them toward other bees, then they begin to cost; and if this perfecting is going on to any great extent at a time when the perfected product is placed on the stage of action, either before or after their presence in large numbers is needed, we not only have the cost of perfecting to pay for, but the cost of their consuming, after being perfected, as well. This consuming part we always have to pay for; but we willingly do it at any time when the production of the individual bee is greater than what it consumes. But I can see no object in doing this at any other time, simply that the extra laying capacity of any queen may be gratified. A hive that is large enough to gratify the greatest aspirations of very prolific queens, at the times of their greatest aspirations, will have too much capital lying idle in it the largest share of the year, and be a bungling, unwieldy live besides.

From all past experience I think that 2400 eggs per day would be a good maximum average for any queen. Rain, cold, or other disturbing influences often retard the activity in the hive, and of the queen, and thus it happens that at times the best of queens often does not lay more than 1000 eggs in a day, while, with the right conditions, she may multiply this number by four, and still have plenty of room in a hive which will give an average of only 2400 daily.

Then, again, as two and one-seventh generations of bees can be brought on the stage of action to where one steps off, we find that, in a hive giving an average of 2400

"WOODLAND APIARY" OF C. G. HEALY. See page 644.

bees daily, we can have in that hive, barring accidents, if the hive is properly managed, 108,000 bees on the stage of action right in the honey harvest, when their productive power is the greatest; and at such a time such a number of bees are a host to roll honey into the sections, with the combs all filled with brood below; and this rolling of honey into the sections means the rolling of money into the beekeeper's pockets, from which come the necessities, comforts and luxuries of life.

Experience has shown the men who are advocating an eight-frame Langstroth hive that such is the best, as this keeps the frames full of brood, and puts honey into the sections.

Again, suppose a colony of bees having a good, prolific queen is given 30 Langstroth frames, using but eight to start with, and adding two or three at a time, as the bees can occupy them, until the 30 are all in, it will be found that such a queen will lay from 4500 to 5000 eggs daily, during the best part of the egg-laying season, and die of old age or exhaustion when from 12 to 18 months old; while with the eight-frame brood-chamber she will give as good results in comb honey each year, and live from three to four years. With the large hive the bees are quite likely to get the start of the queen, and commence to store honey in the brood-combs before entering the sections at all, and in such cases the bees seem loth to go into the sections, but continue to store honey in the brood chamber in preference to going into the sections, thus crowding out the queen with honey, in the combs which ought to be occupied with brood, till we have, as a result, very little section honey in the fall, and a colony in poor condition for winter. Besides, it is well to remember that all queens are not equally prolific, and while 20 percent of our queens would keep the brood-chamber of a ten-frame Langstroth hive properly supplied with brood to give the best results in section honey, the other 80 percent would not be prolific enough to do so; hence, in the majority of the hives in the apiary, we should have a condition working against our best interests, which could not be overcome by the extra amount of comb honey produced by the 20 percent, whose queens were prolific enough to work in these ten-frame hives to advantage.

For these reasons it would seem best to adopt a size of brood-chamber which any and all queens, that are worth keeping at all, would have occupied with brood at the commencement of the honey-flow, thus securing the best yields of surplus section honey at all times.

Because a queen may lay 5000 eggs daily by using plenty of comb-capacity and coaxing, it does not necessarily follow that it is to the best advantage of the apiarist to accommodate or even coax a queen to bring her fullest laying capacity to the front at any time. Queens, in any well-regulated apiary, are among the smallest part of the expense incurred, while labor, hives and combs go toward making up the largest part of the same.

For these reasons I claim that the capacity of the queen should rather be above the capacity of the brood-nest than below it, so that all combs may be fully occupied with brood before the honey harvest arrives. Unless this is the case, the outside combs continue, in most cases, to be dead capital (honey) from year to year. However, all our questioner (or any one else) has to do is to use part ten-frame and part eight-frame hives in the apiary, when a little time will satisfy him which is the better for his locality.

Onondago Co., N. Y.

* The Afterthought. *

The "Old Reliable" seen through New and Unreliable Glasses.
By E. E. HASTY, Sta. B Rural, Toledo, O.

ANCIENT HONEY IDEAS.

Glad to meet the Pythagoras and honey story with as old a date as 1575, and in a shape that can be believed. Undoubtedly scholars might live on *bread* and honey indefinitely. And Dr. Muffet, of 1575, thought honey, good for rheumatism. And in the house in which I live a man with a lame back thinks he must leave off eating honey of which he is very fond. "Many men, etc." The ancient doctor is right, that the healthfulness of honey is improved by heat (that is, by heat properly adjusted); but he is wrong to go to such extremes as to deny the healthfulness of all unheated honey. I wonder what he means by honey "puffed out of the comb." Some verbal error has crept in very likely—otherwise it sounds like some anticipation of the extractor. In "straining" honey the last obtained is not as good as the first, and I guess that is what he is really at. Page 555.

BEES EJECTING THE WATER OF NECTAR.

I hardly know whether or not it is worth while to pitch into Prof. Cook more about his positive opinion that bees never eject the water of nectar while on the wing. Where shall they eject waste water then? in the hive? or shall they go to the Washington Monument to leave it? His argument about the impossibility of the thing is just too awfully thin. The water of our own blood holds lots of things in solution; but for all that nature can get it out very quickly if there is too much of it, or if something has got to come out that will not come unless much water comes along. If nectar had a less percentage of water than the blood of the bee, then we could see that the problem of getting the water away from the sugars and throwing it outside might be a difficult one. It is probably rare for nectar to have such a low percentage of water. Through a wide extent of very thin membrane, made *a-purpose*, the water of the blood and the water of the nectar equalizes rapidly. Then the water in the blood is largely in excess of what it should be, and the proper organs go to work throwing it out as fast as they can—nominally urine, but practically pure water. But of course that's only the way it looks to Prof. Hasty when he looks at it in a hasty way—he never even made the observations himself, merely accepted them from others. Page 548.

ORDINARY AND EMERGENCY QUEEN-CELLS.

What's the matter with "ordinary cells" as a term to designate queen-cells built when a queen is being superseded, and swarming cells also? The boiler is right, page 558, that "swarming cells" is an exceedingly inappropriate term for the former. I didn't think I had any quarrel with "pre-constructed" and "post-constructed;" but "ordinary" and "emergency" might please non-literary brethren somewhat better. Well, yes—six letters shorter, and no alphabetical hair parted in the middle, ought to count as something with all of us.

ALFALEA HONEY AND FLAVOR.

Perhaps it is only poor rhetoric (in the Saturday Evening Post) but it's hardly accuracy to say that alfalfa has a "certain degree" of sweetness not found in the other clovers. Say, rather, alfalfa honey has a character of its own distinct from the others; or say it often excels in the quantity of its yield, if that is what is meant. Page 558.

BROWN SUGAR FOR BEES.

Some of W. K. Morrison's theorizing in favor of brown sugar for bees sounds well; but the matter is rather important, and the present impression of intelligent bee-men is nearly unanimous the other way; so I guess we must call for experiments and experience before we all reverse judgment. Page 558.

SNEAK-THEIVING DURING A HONEY-FLOW.

It is something in the nature of a shock to be told that quiet sneak-thieves prey heavily on strong colonies in the midst of a honey-flow. Very likely they *could*, as bees in flush times are quite tolerant; but the first thing we want to know is whether it is a very great extent a fact. I don't believe it is in my yard. If a bee did start out to work on

such a low moral level I should rather expect him after awhile to transfer his nationality to the more prosperous nation, and next to offset things by carrying stealings in the opposite direction. Page 563.

TRADE BULLETIN QUOTATIONS.

I should suspect that the trade bulletin of a big city would be less reliable on honey prices than the leading honey-dealer of that city—liable to print the figures of somebody's guess, or figures adjusted from one sale at abnormal prices. Page 563.

* The Home Circle. *

Conducted by Prof. A. J. Cook, Claremont, Calif.

MOTHER.

This is surely the most precious word in the home circle. I am reminded of a sweet, wholesome, delightful story that I lately read in a magazine. An acquaintance of a motor-man was riding with his friend on a trolley car as the latter guided and directed it through the streets of our great metropolis. He noticed that the car ran very smoothly, unusually so. In starting and stopping and in making the numerous turns he was not thrown or pushed or handled at all roughly as is the wont so frequently in our rides on the electric cars. He asked his friend, the motor-man, why this consideration was meted out to the fortunate rider on this special car. His friend explained as follows:

After he had run the car for a time his mother came to keep his home for him. He longed to show her his power and hoped she might take long rides with him on his car every day. He proudly took her with him the first day after her arrival, and to give her a rare treat he gave free rein to the current that was silently and invisibly hurling them over street and along roadside. Her mother-love and consideration for her dear boy led her to conceal a mortal fear, and serious pains and aches, as she was pushed, knocked and jammed hither and thither as they flew around bends or stopped and started in a break-neck fashion.

On the morning she as studiously concealed her aches and pains, and serious lameness. He was saddened, and greatly disappointed, that his precious mother wished no more to go with him, as this would turn his work into pleasure, and rare pleasure if it would bring joy to his beloved parent. Finally he learned through a third party, of the shock and inconvenience which his mother had received on the occasion of that first ride. He was dumb with sorrow, chagrin, and contrition. He successfully urged a second ride, and now his care more than equaled his previous rashness. Caution made the start and stop so gentle that those riding felt no jar; the turns were so skillfully made that no push was felt. The fond mother felt no fear, and suffered no harm or inconvenience. She now takes daily rides to the joy of both her own and her son's heart. The son added: "In all of my trips now, I wonder if some other's mother is not in my keeping, and so the crank and levers are ever pulled to check the jar and lessen the shock as the turns are made or the speed varied."

Oh! how few mothers really know or realize the wondrous influence they exert to make the world brighter and better.

THE CALIFORNIA RED-HEADED WOODPECKER.

This is one of the several beautiful California birds that belongs to the order Pici. These birds are quickly known, as two toes oppose two others on each foot, which enables them to hold fast to fence-post or tree-trunk. Their beak or bill is a well fashioned chisel, by which they gouge out the hole that leads to grub, or fashions their nest. Their long tongues are barbed that fishhook-like they may catch and pull out the coveted grub or caterpillar. Mr. and Mrs. Red-head are alike capped with red, and like many other birds, as instantiated in blackbirds and robins, are quite exclusive in their attentions to the one to the other.

Mr. Woodpecker's name is not Roberts. He would not be excluded from his seat in Congress, if elected thereto. Mr. and Mrs. Red-head have a pretty and most interesting habit, working together most delightfully and industriously. They bore numerous holes in quite regular form and position into the great mountain pines. They then lie away to seek the rich, nutritious acorns which they crowd one into each hole, so compactly that one needs his knife to loosen them. Often

a very large acorn is such a misfit that the hole must be greatly enlarged, and then one of the pair holds the nut while the other makes a sort of a bee, calling on other birds to aid. As soon as the hole is sufficiently large, all return to their own work except the two that then adjust the acorn snugly, and proceed with other nuts. Later, as food is scarce, these nuts are eaten, and form many a hearty meal for this faithful and deserving man and wife bird.

THE OJAI.

Queer word is that. We pronounce it O-hí. It means "eagle's nest." It is the name of one of the most lovely spots in California, a veritable basin or nest, whose rim is the lovely wooded mountains which encircle it on all sides. It is in Ventura County, hardly more than a half score of miles to the north of "Ventura, by the Sea." In its nest-like form it is like San Jacinto Escudido, where I am now writing, and El Cajon. The Ojai, however, is peculiar in fondly bearing numerous great, spreading, beautiful live-oaks. Their nest-like valleys, which nestle at the very feet of a great ring of mountains, more beautiful when wooded, with trees and shrubs, are exceedingly lovely. They hold the fortunate people who call them home, with a fascination that makes them ever afterward impatient of any other home. I never feel more close to the verge of envy than when I visit these gems of mountain scenery. I often find my lips whispering: "Oh! always to look upon this grandeur."

BOOTS THAT SHINE.

It is my privilege as conductor of farmer's institutes in Southern California, to be much with the professors of that institution, of which every Californian is so justly proud. In California, where we have little or no rain from April to October, the dust gets very assertive. To keep one's boots resplendent with an immaculate shine is no mean accomplishment. One of my colleagues, who happens to be my companion for these two weeks, has that exceptional faculty. He tells me that Mrs. — often holds him up to the children—their two boys—as an example that they should the better copy. He tells her that in his youth the shine was not so constantly in evidence, but she replies that his mother says not so. We know that the child is father to the man, and I ween the dear, fond old mother is quite right. As we wear our boots in childhood, so we are apt to continue till the locks whiten. How blessed the mother who can always say: "Do as thou seest thy father do," in her efforts at discipline.

Questions and Answers.

CONDUCTED BY

DR. C. C. MILLER, Marengo, Ill.

[The Questions may be mailed to the Bee Journal office, or to Dr. Miller direct, when he will answer them here. Please do not ask the Doctor to send answers by mail.—Editor.]

Questions on Nectar-Yielding Plants.

I want to keep a few colonies of bees, and want to provide a pasture for them. What is the most durable and quickest seeds to sow?

How long does it take buckwheat to come into bloom after coming up (with seasonable weather)? How long does it stay in bloom? Is it fit to cut and feed to stock?

Alfalfa down here doesn't yield any honey.

What is the difference between white sweet clover and white clover?

I had about an acre of crimson clover in the spring which the bees worked on as long as it lasted. I had the seed mixed with alfalfa, but it was no good. Is there anything you can suggest?

TENNESSEE.

ANSWERS.—Answering your questions somewhat out of their exact order, I can not say how long it is from coming up till bloom of buckwheat, never having taken exact observations, but should say at a guess from memory, three or four weeks might not be out of the way. But that guess may be considerably out of the way. As to length of blooming season, my guess would be also three or four weeks. Very likely both of these guesses might be lengthened. The blooming season is very often closed by the

first frost. I think buckwheat is never cut up and fed to stock, but the grain is harvested.

The difference between white clover and sweet clover is about seven feet. White clover grows close to the ground and has its blossoms as globular heads like red and crimson clover; white sweet clover grows tall and has its blossoms singly all over the bush. Very likely sweet clover and crimson clover will be as good as anything you can sow. Crimson blossoms early, and probably closes about the time sweet clover comes in bloom, and the latter will bloom till after several frosts. If harvested for hay before it comes in bloom, the full blooming will be later than if left to its own course.

Queer Idea About Rye Flour and Bees.

How do you fix rye-flour for bees to make comb for their hives? I can not find any one that knows anything about rye flour. I have read that they make comb out of rye, but I don't know what to do. I have a quantity of rye flour.

GEORGIA.

ANSWER.—I think you must have been misinformed. Rye flour is used sometimes as a substitute for pollen, but not as a material from which comb can be directly produced. Bees make comb only as it is needed, and it is honey more than pollen that is used in its production. It will be wise to feed rye flour to bees only in the event of a scarcity of pollen, and you can most likely make a better use of your rye flour than to feed it to bees.

Swarming of a Divided Swarm.

After making a divided swarm, as described by Mr. Doolittle on page 478, is there danger of them swarming any more that season, provided they are supplied with enough supers and sections to keep them from getting overcrowded?

LOUISIANA.

ANSWER.—I should say there was no more danger of swarming than the danger in the case of a natural swarm.

Honey-Dew for Winter—Insuring Bees.

1. I have 48 colonies with plenty of bees and honey, but I am afraid they will not winter well, as they have gathered considerable honey-dew, or bug-juice, if I may call it such. My bees have been working on honey-dew all through the month of September, and I think it will last as long as the weather stays warm enough for the bees to work. Will they winter all right if I use a Hill's device and a chaff cushion over them, and packed on the outside with fresh leaves on both sides and back about four inches thick?

2. Is there such a thing as insuring bees against loss in wintering in this locality? If so, where and what do they usually charge per colony? Say from Nov. 1 to May 1.

ILLINOIS.

ANSWERS.—1. There is a great deal of difference in honey-dew. Some of it will do well for winter stores, and some of it is little better than poison. It would be impossible to say which kind your bees are getting, but if bees have generally wintered well in your locality you may be on the hopeful side, for it is quite likely that they have had the same thing in other years.

2. I don't know of any such insurance, but will yield the floor to any one who does.

Queen-Introduction—Pure Italian.

1. I was rather unfortunate in my queen-rearing during the late summer. Out of 14 queens emerging during June and the early part of July, all but two were missing before they began to lay; after that they did better. I had to give some colonies three cells before I got a queen to lay, and in one case I had to introduce a bought one. The weather during the early part of summer was very cool; in only five or six days up to nearly the middle of July did the highest temperature reach 70° Fahr., and it was seldom much over 60°. Do you think that would account for the loss of queens? If not, what would?

2. I have bought three queens and introduced them safely, but I noticed, in one case, on two occasions, where I

looked into the hive, a number of cells with two, three, and, in a few, four eggs; on the last look I saw worker-brood capped over, looking all right. Would you consider that queen a faulty one?

3. I think I saw recently in one of your answers that if a drone was dark it was not pure Italian. I got a tested queen last year from a well-known firm, and while all the workers have the three bands, the drones are quite dark, some showing a dash of dark gold and some none. Would you consider that queen pure Italian?

BRITISH COLUMBIA.

ANSWERS.—1. Weather seldom warmer than 60° and never more than 70° would be enough to account for your loss.

2. It is not very unusual that a queen on first introduction after a journey in the mails does something out of the common line, and afterward does her work in good shape. It is just possible, too, that the workers rather than the queen were at fault. If bees were few in number, and if the queen was a good layer, she might need more room to lay than the space covered by bees, in which case you might find a plurality of eggs in a cell. At all events, if you later found sealed brood in regular order you need have no anxiety.

3. If I used language to give you the impression that I thought a dark drone was proof of impure blood, I advise you not to put too much reliance on the statement. The looks of either queen or drone can hardly be taken as a test of purity. Some excellent Italian queens have been very dark, and the same may be said of drones. The workers are the ones by which purity is judged.

Don't Feed Sugar to Complete Sections.

1. I have 20 supers about half full. Can I mix honey, sugar and water and let the bees finish them? If so, what proportion of each would be best?

2. There are plenty of drones flying now. What does that indicate?

INDIANA.

ANSWERS.—1. Don't think for a minute of using even the smallest proportion of sugar to finish sections. Just now about the greatest fee bee-keepers have to fight is adulteration, and for them to band together in a national association to fight it, and then feed sugar themselves to get sections finished would be about as consistent as is the Christian man who prays 364 days in the year for the downfall of the saloon, and then on the 365th day votes to support it. If you want to feed to have sections finished, use diluted honey. Very few, however, have been able to make it pay. Better sell at reduced price sections that are not finished, and let the bees empty out any that are less than half full. Pile up outdoors supers of sections you want bees to empty, and allow entrance for only one or two bees at a time. If you allow a larger entrance, the bees will tear the comb to pieces.

2. It does not have any special significance; at least it may not. Sometimes colonies that have a good queen will suffer drones to continue. At the same time it may be that some colony or colonies have laying workers or drone-laying queens.

Killing off Drones.

What is the cause of drones in some of my colonies? One of the strongest has lots of them. They are killing off the drones this early, Sept. 24.

INDIANA.

ANSWER.—There is nothing strange about it. The strongest colonies would not feel in so much of a hurry to kill off their drones as the weakest ones, especially if the strongest ones had queens and were superseding them.

German or Italian Queen.

Is the queen enclosed herewith a genuine German, or is she crossed with Italian blood?

CALIFORNIA.

ANSWER. I don't know. You can't decide by the looks of a queen as to her blood. You must have her worker progeny to judge by. I have seen imported Italian queens as dark as the sample sent, while their worker progeny were beautifully marked with the three yellow bands.

REVERSIBLE WALL MAP

—OF THE—

UNITED STATES AND WORLD,

WITH SPECIAL INSET MAPS OF

Ghina, Cuba, Porto Rico, The Philippines, Hawaii, and Alaska,

Especially prepared to meet the demand for a first-class map that will give a quick, general idea of location of events the world over, and particularly to the United States and our territorial possessions. **Very useful in every Home and Office.**

66 x 46 INCHES IN SIZE.

ELEVEN BEAUTIFUL COLORS.

**Best and Most Necessary Map
Ever Issued.**

**No Home or Business House
should be without it.**

The **XX** Plates

are works of art. The engraving is plain, bold, and decisive. The color work is elegantly contrasted, but not gaudy.

Perfection and Artistic Elegance

a salient feature of this map not approached by any similar publication.

XXXX Marginal Index

is one of the invaluable features.

It gives an alphabetical list of countries, their location on map, style of government, population, area, products, minerals, imports, exports, etc.

It has been pronounced a **XXXX** Photograph of the World

One side shows a grand map of our great country, with **counties**, railroads, towns, rivers, etc., correctly located. The other side shows an equally good map of the world. Statistics on the population, cities, capitals, rivers, mountains, products, business, etc., a veritable photograph of the UNITED STATES AND WORLD.

The map is printed on heavy map paper and is mounted on sticks ready to hang. Edges are bound with tape.

1901 EDITION.—Every reader should consult it every day. The plates show all the new railroad lines and extensions, county changes, etc. Special attention is given to the topography of the country; all the principal rivers and lakes, mountain ranges and peaks are plainly indicated. The leading cities and towns are shown, special attention being given to those along lines of railroads. The Canadian section of the map gives the provinces of Ontario, Manitoba, and British Columbia, with nearly all of Quebec and New Brunswick, the county divisions being clearly marked. The Southern portion of the map includes the Northern States of the Republic of Mexico, and the Bahama Islands.

On the reverse side is the Library Map of the World. The largest and most accurate map on Mercator's Projection ever produced. The political divisions are correctly defined and beautifully outlined in colors. The ocean currents are clearly shown and named. Ocean steamship lines with distances between important ports are given. A marginal index of letters and figures enables one easily to locate every country in the world. A series of short articles in alphabetical order is printed around the border of this map in large, clear type, containing valuable information concerning agricultural, mining, and manufacturing statistics, also the value of imports and exports in dollars. The area, population, form of government, and chief executive of every country in the world is given up to date, also the names of the capitals and their population. **The Inset Maps** are elegantly engraved and printed in colors. They are placed in convenient positions around the United States map, and will be invaluable to every person desiring a plain understanding of our possessions. An inset map of China on the World side of map adds to its value.

Two maps forward it free as a premium for sending us **Three New Subscribers** at \$1.00 each; or for \$2.00 we will send the Map and the American Bee Journal for one year. Address,

GEORGE W. YORK & CO.,

144 & 146 Erie Street, CHICAGO, ILL.

The 1900 Census **XXXX** of the largest American Cities is given.

Bees in Fine Condition.

The honey season is over, and the bees are in fine condition for winter. Our crop was 23 tons from 400 colonies, spring count, and increased to 425 colonies. Two of us did all the work, and found time to do considerable on the farm besides.

L. L. ANDREWS,
Riverside Co., Calif., Sept. 11.

Bees and Pear-Blight.

I notice in the American Bee Journal an item in regard to bees spreading pear-blight. I see some think the bees spread it, and some think they do not. I am of the latter opinion. I have an apiary of 11 colonies in the orchard. Last year the blight appeared on every pear-tree I had but the Bartlett and another late pear; this year some of the trees died almost to the roots, while some of the Bartletts blighted just a little. What makes me think the bees do not spread the blight is a tree that stands close to others that died, does not show a bit of blight, and is loaded with fruit; and a tree of the same kind, about 20 yards away, died clear down. Another instance is a seedling I let grow some distance from the others; it did not have a blossom, and never did. It took the disease, and died. Now, if the bees spread the blight why did this tree and any other Bartlett not take it? All were loaded this spring, even to those that died, showing the bees had worked on them, if it is true about fruit needing bees to cross-pollinate. And why did the seedling take it? Can you answer that? Cutting off the diseased parts seems to stop the disease to some extent here.

Latah Co., Ida. F. C. HOLMBOEK.

Poorest Honey-Year in Nine.

We have no surplus honey here this season, but we are doing well now. It is the poorest honey-year we have had in central California in the nine years I have lived here.

J. W. STEELE,
Merced Co., Calif., Sept. 1.

Troubled With Grasshoppers.

The bees in this part of California have done no good, hardly made a living. In fact, I fed mine until the latter part of June, but I am pleased to say they are doing well now, and filling up with brood. They did no good until the latter part of August. The cause, I think, was grasshoppers on the alfalfa fields; the fields were literally covered with the little jumpers, and the bloom blasted. The bees would sit out on the alighting-board and act as if they were looking for a job. But now that is all changed; they are out by the time the sun is up, flying higher and yon, gathering the nectar from the alfalfa and carpet-plant. Most of the grasshoppers have disappeared.

I have just received the American Bee Journal. It is full of good things for the bee men and women. I like it very much; in fact, it is almost indispensable. I have tried the straw for robbing, and had it very good. It has stopped it every time for me.

MRS. ARTIE BOWEN,
Merced Co., Calif., Sept. 2.

The Seasons of 1899 and 1901.

I wish to remind the bee-keepers of the Mississippi valley what educators to us the years 1899 and 1901 have been. 1899 with no surplus honey from clover, but plenty to keep up good strength from July 1 to late fall, which gave us about 40 pounds of nice comb honey from heartsease—a plant which thrives so well here, and nearly always yields nectar plentifully. This fine crop was gathered all because the colonies were strong at just the right time.

Because of a severe drought, 1901 has yielded

only a light crop from clover, ending two weeks earlier than usual, leaving nothing of much account for bees to work on from July 15 to Aug. 5, a period of 20 days, when very few eggs were laid by the queens a period just when all queens should have been filling every available cell with eggs. So our bees came up to an abundant flow from heartsease with only a little or half the strength maintained in 1899, which has been, to our loss, on every 100 colonies of at least \$200, which could have been remedied if foreseen. Stimulating to activity from July 15 to Aug. 5 would have done the job, and with little expense, as I believe the feeding could have been done outdoors in paraffined troughs at intervals of three days, and a substitute for pollen given. However, some honey has been obtained wherever colonies showed fair strength, and where any colony was very strong 40 pounds of nice honey in the comb is the result anywhere among my yards.

Who will be the first to inform us of a certain race or strain of bees that will always be strong and ready for gathering honey from Aug. 15 to Sept. 20? FRANK COVERDALE, Jackson Co., Iowa, Sept. 12.

Fleabane—“Old Grimes.”

I send a sample of a plant on which the bees are now working. It is of low, bushy habit, not unlike our common sagebrush.

The honey crop here is decidedly short. I wish “Old Grimes” would take up his pen again; his articles were practical.

E. F. ATWATER,

Ada Co., Idaho, Sept. 18.

Perhaps “Old Grimes” will take your hint, Mr. Atwater, and “wake up” again.

Our botanist reports as follows:—EDITOR.

Here is another good honey-plant, the fleabane, belonging to the famous Composite family. If this and many other plants hailing from this justly prized family were scattered freely over the State of Idaho, our good brother would never complain about the honey crop being “decidedly short.” C. L. WALTON.

Short Honey Crop.

The honey crop here is small this year. I wish all bee-keepers could be induced to take the American Bee Journal, as they are not informed on the honey market, and ruin the market for me. But you see, those are some of a bee-keeper's pleasures.

CLYDE CODY,

Jackson Co., Mich., Sept. 23.

A Fairly Good Bee-Season.

This has been a fairly good bee-season here. I started with 20 colonies in the spring, and have increased to 50. I have just taken off about 400 pounds of honey.

There is quite a large acreage of red clover in this section, which affords good bee-pasturage. I appreciate the American Bee Journal very much, and owe much of my success with bees to knowledge gleaned from it.

LATAH CO., IDAHO, SEPT. 15.

Of the Evening Primrose Family.

I send a sample of leaf and blossom of a weed that grows sparingly around here, on which bees work profusely, and from which I believe they gather both pollen and honey. I do not know, and have found no one who does know, what it is. It grows about like anodendron in size. My attention was first attracted to it by the hum of the bees on it. It is undoubtedly a fine bee-plant, and I would like you to tell me through the General Items column of your excellent paper what the name of the weed is, and your opinion as to its value, as I want to save seed if it is considered a good honey-plant.

I have kept bees myself for five years, my father keeping them till I commenced, and my grandfather always kept them. I have

To make cows pay, use Sharples Cream Separators. Book “Business Dairying” & Cut. 212 tree. W. Chester, Pa.

taken and read with great pleasure the American Journal for about four years, and I have enjoyed its weekly visits immensely.

I have only 15 colonies, but I am prepared to increase when spring comes again. Not boasting at all, but I have the name of keeping the nicest apiary, and being the best informed bee-man in this section, and I give the credit to the American Bee Journal, as that is where I get my knowledge.

This has been an exceedingly poor honey-year in northeast Missouri, owing to the drought that has prevailed since in April. Yet I am not as those who have no hope, and forgetting the things that have passed I look forward for better seasons and greater blessings.

Long live the American Bee Journal!
H. S. CARROLL.
Shelby Co., Mo., Aug. 3.

The plant belongs to the Evening Primrose family. Its botanical name is *Gaucha biennis*, and it goes by its first name—*Gaucha*.

Writers on honey-producing plants do not speak of it as being especially productive, but bees are not easily deceived, and if they are interested in the flower no doubt it is furnishing them honey or pollen, probably both.—C. L. WALTON.]

Bees Did Fairly Well.

My bees have done very well this year, considering the very dry summer we have had, with only a few local showers since April 17, and none to do much good. We have taken nearly 500 pounds of comb honey from 7 colonies.

White clover yielded well until killed by the drought. Persimmon bloom also was full of nectar. There was a good deal of honey-dead this summer. A man told me that when he cut his wheat the reel on the machine splattered it over him, and that his horses' legs were sticky with it. Some of the people here say that it comes down like mist.

My first swarm came out April 27, and went into an empty hive without clustering. They sent out a swarm Aug. 21, and as there was no one at home, they left for parts unknown.

Most of the bee-keepers here are of the old-fashioned kind, and some of them feed their bees corn-bread. Mrs. R. R. Tritt.
Wright Co., Mo., Sept. 21.

Introducing Queens.

Without desiring to provoke further discussion in respect to the matter of love, hatred, or selfishness in the honey-bee (see page 538), I wish to say that it surprises me that any one should take seriously what was said on pages 405 and 406 respecting these attributes, and attempt to disprove my position. It was distinctly stated by me that neither position is fairly won, is my belief that such qualities belong to a higher order of beings. That love, hatred, generosity, selfishness, are all attributes which inhere to mankind, but not to any of the lower animals.

Then, so far as I am concerned, that matter is disposed of.

In regard to introducing a queen, it is no doubt true that an expert would succeed after taking the necessary precautions in running her into the entrance, but such practice is not in accordance with the instructions given in any work upon the subject which has come under my observation; yet, it doesn't follow that it can not be done; in fact, many things are done with bees out of the ordinary way with success. However, as was said before to the *beginner*, don't try any such experiment with a valuable queen. Wait until you have become better acquainted with the business. Follow the instructions given in the recognized works upon the subject. Wm. M. WHITNEY.

A Handsome, Helpful Book. "More Money From Your Hens" is the title of a new book issued by the Stratton Mfg. Co., of Erie, Pa., manufacturers of the well-known line of Dandy Green Bone Cutters. It is attractively printed in two colors, well illustrated, and goes into the question of making poultry profitable, in a very thorough manner. Of course it places special emphasis on the value of freshly-cut green bone as an egg-producer and growth promoter. There is no doubt in the minds of poultry-raisers that a little green bone added to the feeding ration is productive of the very best results in two ways; it not only saves in the grain bill, but it also makes the poultry more productive in every way. It is a double-headed money-maker.

The "Dandy" Bone Cutter has been on the market a number of years with increasing popularity. It has an automatic feeding device, is strongly and substantially built, has a large cutting capacity, and we know that numerous of our readers have demonstrated that it is a satisfactory machine in every way. You will be interested in the handsome book which they send free. Ask for it, and please mention the American Bee Journal when writing to them.

Handling Disease-Infected Tools.

Some have written us that, even after they had used the McEvoy treatment for handling foul brood, the disease broke out again. Many bee-keepers do not realize in spite of all that has been said, the importance of having everything that comes in contact with foul or black brood either burned up or shut up in a tight box or room where bees can not get at it. Metal tools, such as screwdrivers, pries, etc., should be put on a bed of live coals for a few seconds, not long enough to draw the temper, but to destroy everything in the way of microbes that may still be hanging about the articles. Smokers should be painted over with a strong solution of carbolic acid, and the fire-cup can be disinfected by making a good, hot, roaring fire in it. Division-boards and bee-feeders, and things like that, should either be immersed in boiling water and kept there for a time, or should be dipped in a strong solution of carbolic acid—one part of the acid to fifty of water. When I speak of the acid I refer to the crystals, and not to the solution that is ordinarily obtained at the drug-stores.

In burning old combs I would first make a good bonfire and get a lot of live coals; then lay the combs on top of the coals one by one. But do not put them on too fast; and as a further precaution (for the wax sometimes runs down into the ground without becoming sufficiently heated) I would bury the ashes and the ground under them. Put them so far below the surface that neither plow nor spade will ever dig them up.—Gleanings in Bee-Culture.

Shallow Frames for Comb Honey.

The tendency among expert bee-keepers is toward a shallower frame than the standard Langstroth. Some others prefer the Langstroth because it has always given good results. But the other class consider that the frame given us by the father of American bee-keeping is a little too deep. They desire a frame just shallow enough so that there will be no honey, or very little at best, stored in the brood-nest. Said Mr. Vernon Burt.

"With my shallow frames I often have no more honey in them than the size of a silver dollar; and I estimate that, if my colonies had all been in the shallow hive, I should have secured 20 pounds more per colony."

This is a strong statement, but Mr. Burt says he is ready to verify it by showing the piles of honey that have come off the shallow frames and the amounts that have come off the deeper ones. While he does not claim the bees would store any more honey in our hive than in another, if we include both the super and the brood-nest, yet he says that, in-

Extracted Honey For Sale

ALL IN 60-POUND TIN CANS.

Alfalfa Honey

This is the famous White Extracted Honey gathered in the great Alfalfa regions of the Central West. It is a splendid honey, and nearly everybody who cares to eat honey at all can't get enough of the Alfalfa extracted.

Basswood Honey

This is the well-known light-colored honey gathered from the rich, nectar-fallen bass-wood blossoms. It has a stronger flavor than Alfalfa, and is preferred by those who like a distinct flavor in their honey.

Prices of Alfalfa or Basswood Honey:

A sample of either, by mail, 10 cents, to pay for package and postage. By freight—two 60-pound cans of Alfalfa, 8 cents per pound; four or more cans, 7½ cents per pound. Basswood Honey, ½ cent more per pound than Alfalfa prices. Cash must accompany each order. You can order half of each kind of honey, if you so desire. The cans are boxed. This is all

ABSOLUTELY PURE HONEY

The finest of their kinds produced in this country.

Read Dr. Miller's Testimony on Alfalfa Honey:

I've just sampled the honey you sent, and it's prime. Thank you. I feel that I'm something of a heretic, to sell several thousand pounds of honey of my own production and then buy honey of you for my own use. But however loyal one ought to be to the honey of his own region, there's no denying the fact that for use in any kind of hot drink, where one prefers the more wholesome honey to sugar, the very excellent quality of alfalfa honey I have received from you is better suited than the honeys of more marked flavor, according to my taste.

McHenry Co., Ill.

C. C. MILLER.

Order the Above Honey and then Sell It.

We would suggest that those bee-keepers who did not produce enough honey for their home demand this year, just order some of the above, and sell it. And others, who want to earn some money, can get this honey and work up a demand for it almost anywhere.

GEORGE W. YORK & CO., 144 & 146 Erie St., Chicago, Ill.

stead of there being from 25 to 30 pounds of honey left in the brood-nest, which he does not want there, that amount all goes into the supers, where he does want it, and where he can command the very best market price obtainable. When I asked Mr. Burt if it was not desirable to have honey in the brood-nest, he said it was not, according to his practice. "I prefer," he said, "to sell my honey, when I do get it, at 12 and 15 cents, and then buy syrup at 3 or 4 cents; and I not only make a good trade, but I give the bees a much better feed. While good honey does very well most winters, yet there are occasional ones when the syrup-fed colonies come out much better. No, sir," said he, very emphatically, "I do not want any honey in the brood-nest in late summer. I prefer to feed sugar syrup, for then I know my bees have the very best food for winter."—Gleanings in Bee-Culture.

Some Points in Indoor Wintering.

Some that are of interest are given by Mr. Darling, in the Canadian Bee Journal. Formerly great stress was laid upon the covering in winter, so that the right amount of upward ventilation could be secured; but of late many are coming to the conclusion that Mr. Darling has reached, that it is not a matter of special importance how the air is introduced into the hive, only that there is enough of it, and if plenty of good air can enter below, the upper part may be as tight as a drum. Mr. Darling says:

In regard to packing, I have used sawdust and corkdust. I have not tried wintering outside at all; I live where it is too cold—too near the North pole—but for years I took off the propolized sheet and put on a cotton cushion filled with sawdust or corkdust (I brought the sawdust from the sawmill and the sash-factory), and I failed to see very much difference in their effect, only I thought the sawdust from the sawmill was not quite so warm, and the corkdust is a little drier. There is so much evaporation from bees that if you take a little piece of lath and leave it lying on top of the cushion, without any cover on at all, if you lift that piece of lath up any time after it has been there a few hours, there will be a wet spot on that cushion the size of that piece of lath. If nothing touches the cushion it is dry all winter long, and the sawdust is dry. Lift the cushion and put your hand under it and it is warm and cosy on top of the sheet, if there is a sheet underneath.

I had formerly tight bottom-boards, and that is the reason I took off the propolized sheet. Lately I have taken off the bottom-board, left the propolized sheet on, and put the cushion on; that allows no moisture to get through, but I raise up my hive at the front—I don't like going to the back to let them down—and I find that they winter just as well and better than they did without the propolized sheet, and with the bottom-board tight there is no danger of there being any dampness above, and my combs and bees are not as damp as they were when the boards were fastened.

Queens Fertilized in an Upper Story.

Our Mr. Wardell, the man who has charge of our 700 colonies, has evolved a system of having queens fertilized in upper stories, that is a perfect success. I do not speak of it because it may be new, but because it gives excellent results. He tried it to some extent last year, and now, after having tested it thoroughly the whole season with scarcely a failure, we are pleased to recommend it. By his plan he succeeds in getting three queens fertilized in one upper story at a time; that is to say, there may be three virgins, all of which will be fertilized within the usual time. The method is this:

He takes an ordinary Langstroth upper story, and divides it off lengthwise into three bee-tight compartments of equal size. On the under side of this story and a bee-space below the frames he tacks a sheet of wire-cloth. The partitions come in contact with

wire-cloth at the bottom, and the cover at the top thus making each little room separate and bee-tight. On two sides and one end are entrances, one entrance communicating with each compartment.

This super, as constructed, is now put on over a strong colony, wire-cloth down next to the bees. Into each of the compartments he puts two frames of bees, brood, and honey. He then inserts a queen-cell, or lets run into each a virgin queen. The cover is put on, and the bees are left to their own devices. He now has practically three 2-frame nuclei, each one with a cell or virgin queen right over a strong colony, the only separation being the wire-cloth. And right here is the feature that makes it a success: The old methods have used perforated zinc, while Mr. Wardell uses wire-cloth. Now for results:

These young queens fly out from the entrances from the upper story, are fertilized, and come back. If cool weather comes on it does not make any difference, because there is a large amount of heat from the cluster of bees below that rises up through the wire-cloth.

The great feature in favor of this method is that, in the fall, or at the close of the season, when it is desired to unite the bees, and the young queens have all been sold from the upper story, all one has to do is to remove the wire-cloth from the two stories, and let the bees run together. They all have the same scent, and there is no fighting.

This scheme has also another advantage: It economizes room in the yard, and brings the nuclei up to a nice height for the apiarist to work. We also make one colony do the work of three nuclei; and if honey is coming in, the colony can store just the same; but, of course, the frames of honey would have to be removed as fast as filled with honey. If one of the nuclei runs short of brood, all that is necessary is to remove the upper story for a minute or two, take out the empty comb from the nucleus, and substitute it for a frame of brood from the colony below. Set this, bees and all, into the nucleus, replace the upper story, and all will go on as before. There will be no fighting, because, understand, the bees are all of the same scent.—Gleanings in Bee-Culture.

WISCONSIN FARM LANDS.

The best of farm lands can be obtained now in Marinette County, Wisconsin, on the Chicago, Milwaukee & St. Paul Railway, at a low price and on very favorable terms. Wisconsin is noted for its fine crops, excellent markets and healthful climate. Why rent a farm when you can buy one much cheaper than you can rent, and in a few years it will be your own property. An Old Friend. Among the very first of the incubator and brooder concerns of the country to advertise in our columns was the "Reliable," of Quincy, Ill. Although a number of years has passed since their first advertisement appeared in our paper, there has not been a word since that first time when they have not been with us during the regular advertising season. It affords us, therefore, more than usual pleasure to state that they will advertise with us again this season, and their announcement appears on another page of this issue. Our relationship with these people has been most pleasant through all these years, and while we feel that our paper has been the means of doing them much good, we also know that they have done much good to our readers. The Reliable goods are reliable in work and as well as in name, and those of our readers who contemplate the purchase of machines of this class can do no better than to buy the time-tested old Reliable. Their 20th Century Catalog is, as usual, a work of great value. Write them today for a copy. Address, Reliable Incubator and Brooder Co., Quincy, Ill., and mention this paper.

HONEY AND BEESWAX

MARKET QUOTATIONS.

CHICAGO, Sept. 18.—No. 1 white comb honey is selling at 15c per pound, with occasionally a little more being obtained for fancy, the which does not grade No. 1 selling at from 13c to 14c, with the light amber at 12c to 13c; dark honey of various kinds, selling at 10c to 12c. Extracted in moderate demand at from 5c to 6c for the various grades of white; some fancy white clover and basswood bringing 7c; light amber ranging from 5c to 5 1/2 c; dark at 5c to 5 1/2 c. Beeswax firm at 26c to 27c. R. A. BURNETT & Co.

CINCINNATI, Aug. 10.—The honey market is rather dull on account of the warm weather. Extracted sells only to manufacturers from 5c to 6c; better grades alfalfa water-white from 6c to 7c; white clover from 8c to 9c. Fancy white comb honey sells from 13c to 15c. C. H. W. WEBER.

BOSTON, Sept. 27.—We quote our market as follows: Fancy white in cases, 1 lb., No. 1, 15c; No. 1, 14c. Extracted, white, 3 1/2 c; light amber, 3c; amber, 2 1/2 c to 3c.

BLAKE, SCOTT & LEE.

ALBANY, N. Y., Sept. 19.—We quote: Fancy white comb, 1 lb., No. 1, 15c; mixed, 13c to 14c; No. 1 buckwheat or amber, 12c to 13c; clover, 10c to 11c; light, 7c to 8c; dark, 5c to 6c. Beeswax, 28c to 29c. H. R. WRIGHT.

OMAHA, Aug. 8.—New comb honey is arriving by express in small quantities from Iowa and Colorado, and selling at \$3.50 per case in a retail way. California extracted honey is being offered at 10c to 11c per pound, from California shipping-points, but we have not heard of any sales having been made thus far. The production of extracted honey seems to be quite large this year in Colorado, Utah and California. PEYCKE BROS.

NEW YORK, Sept. 10.—Comb honey is now beginning to arrive in large quantities, and, as a rule, quality is fine. The demand is good, and we quote as follows: Fancy white, 14c to 15c; No. 1, 13c to 14c; and amber, 12c to 13c. Wheat is on the market as yet, but are expecting same within a week or so. Extracted is selling slowly, with plenty of supply, at 5c to 6c, according to quality, and amber, and sometimes at from 5 1/2 c to 6c per pound. Beeswax dull at 27c. HILDRETH & SEGELKEN.

DES MOINES, Aug. 7.—There is very little doing here in new crop of honey. Some small lots of near-by produced comb honey are on the market and selling in retail way at \$3.50 to \$3.75 per case. We do not look for much trade in this line before Sept. 1. Our market does not consume a great deal of extracted honey. PEYCKE BROS. & CHANEY.

DETROIT, Aug. 12.—Fancy white comb honey, 14c to 15c; No. 1, 13c to 14c; and dark, 12c to 13c. Extracted, white, 6c to 7c. Beeswax, 25c to 26c. M. H. HUNT & SON.

BUFFALO, Aug. 10.—Quite a good demand for fancy honey, 16c to 17c, and lower grades, 12c to 14c; old neglected. Advise moderate shipments only of new as yet. BATTERSON & Co.

SAN FRANCISCO, Sept. 4.—White comb, 10c to 12c; amber, 7c to 8c, dark, 6c to 7c cents. Extracted, white, 5c to 6c; light amber, 4c to 5c; amber, 3c to 4c. Beeswax, 25c to 26c.

Arrivals and spot offerings are of moderate volume, but there is as much or more on market than can be conveniently or advantageously placed. To secure liberal custom, prices would have to be shaded in favor of buyers. In a small way for especially desirable lots slightly higher figures than are quoted are obtainable.

KANSAS CITY, Sept. 14.—Up to the present time only small lots of new comb honey have been on the market, and these met with ready sale on the basis of 15c to 16c per pound for fancy white. For the next week heavier receipts are expected and quotations are issued at \$3.00 to \$3.25 per case for large lots, which would be quite about 14c to 14 1/2 c; the demand being equal to brisk, a firm market is anticipated. Inquiries for extracted are a little more numerous, but large buyers still seem to have their ideas too low. In a small way 5 1/2 c to 6c is quotable. PEYCKE BROS.

A New Bee-Keeper's Song—

"Buckwheat Cakes and Honey"

Words by EUGENE SECOR.

Music by GEORGE W. YORK.

This song was written specially for the Buffalo convention, and was sung there. It is written for organ or piano, as have been all the songs written for bee-keepers. Every home should have a copy of it, as well as a copy of

"THE HUM OF THE BEES IN THE APPLE-TREE BLOOM"

Written by

EUGENE SECOR and DR. C. C. MILLER.

PRICES—Either song will be mailed for 10 cents (stamps or silver), or both for only 15 cents. Or, for \$1.00 *strictly in advance* payment of a year's subscription to the American Bee Journal, we will mail both of these songs free, if asked for.

RED CLOVER QUEENS

BLACK ROCK, N. Y., Sept. 3, 1901.

FRIEND ERNEST:—I will try and tell you what you want to know about that queen. I got her of you in 1899 as a premium with GLEANINGS. I never saw a small colony of bees build up as that one did. In the spring of 1900 they came out in fine shape, wintered perfect. I raised them up in May and gave them 8 frames more so the queen would not want for room. I never saw such a colony of bees as they were in June, and they were actually storing honey when other bees in my yard were starving. No! they were not robbing. I never saw those two best colonies of mine trying to rob. THEY CERTAINLY WORK ON RED CLOVER. This is no guesswork, as I have seen them. As you know, the past two seasons have been very poor, and what honey my bees did get in 1900 candied soon after cold weather set in. I packed this colony in a chaff hive and left them out, thinking that such a strong colony would winter perfect. The snow came on the middle of November, and those poor bees never a fly until the last of March or the first of April. When warm weather at last came I thought they were dead, as they did not seem to be flying much, so I did not pay any attention to them until in June. I noticed they were working a little, so I opened up the hive and found them in the upper story. I took the lower story out and left them in the one body. The queen was laying nicely, and I thought they would make a good colony to winter. Along the last of July I noticed that they needed more room. I gave them super, 24 boxes, and in a few days they had it full. They have made 72 boxes of as nice honey as you ever saw, and are drawing out some starters now, Sept. 2.

Very truly yours,

GEO. B. HOWE.

MEMBERSHIP DUES, \$1.00 a year.

If more convenient, Dues may be sent to the office of the American Bee Journal, when they will be forwarded to Mr. Secor, who will mail individual receipts.

A Cellinoid Queen-Button is a very pretty thing for a bee-keeper or honey-seller to wear on his coat-lapel. It often serves to introduce the subject of honey, and frequently leads to a sale.

NOTE.—One reader writes: "I have every reason to believe that it would be a very good idea for every bee-keeper to wear one (of the buttons) as it will cause people to ask questions about the busy bee, and many a conversation thus started would wind up with the sale of more or less honey; at any rate it would give the bee-keeper a superior opportunity to enlighten many a person in regard to honey and bees."

The picture shown herewith is a reproduction of a motto queen-button that we are furnishing to bee-keepers. It has a pin on the underside to fasten it.

Price, by mail, 6 cents; two for 10 cents; or 6 for 25 cents. Send all orders to the office of the American Bee Journal.

Langstroth on... The Honey-Bee

Revised by Dadant—1900 Edition.

This is one of the standard books on bee-culture, and ought to be in the library of every bee-keeper. It is bound substantially in cloth, and contains over 500 pages, being revised by those large, practical bee-keepers, so well-known to all the readers of the American Bee Journal—Chas. Dadant & Son. Each subject is clearly and thoroly explained, so that by following the instructions of this book one cannot fail to be wonderfully helped on the way to success with bees.

The book we mail for \$1.25, or club it with the American Bee Journal for one year—both for \$1.75; or, we will mail it as a premium for sending us THREE NEW subscribers to the Bee Journal for one year, with \$3.00.

This is a splendid chance to get a grand bee-book for a very little money or work.

GEORGE W. YORK & CO.

144 & 146 Erie Street, CHICAGO, ILL.

—THE— The Bee-Keeper's Guide;

Or, Manual of the Apiary,

—BY—

PROF. A. J. COOK.

460 Pages—16th (1899) Edition—18th Thousand—\$1.25 postpaid.

A description of the book here is quite unnecessary—it is simply the most complete scientific and practical bee-book published to-day. Fully illustrated, and all written in the most fascinating style. The author is also too well-known to the whole bee-world to require any introduction. No bee-keeper is fully equipped, or his library complete, without **THE BEE-KEEPER'S GUIDE**.

This 16th and latest edition of Prof. Cook's magnificent book of 460 pages, in neat and substantial cloth binding, we propose to **GIVE AWAY** to our present subscribers, for the work of getting NEW subscribers for the American Bee Journal.

Given for TWO New Subscribers.

The following offer is made to **PRESENT** subscribers only, and no premium is also given to the two new subscribers—simply the Bee Journal for one year:

Send us two new SUBSCRIBERS to the Bee Journal (with \$2.00), and we will mail you a copy of Prof. Cook's book **FREE** as a premium. Prof. Cook's book alone sent for \$1.25, or we club it with the Bee Journal for a year—both for only \$1.75. But surely anybody can get only TWO NEW subscribers to the Bee Journal for a year, and thus get the book as a premium. Let every body try for it. Will YOU have one?

GEORGE W. YORK & CO.,

144 & 146 Erie Street, CHICAGO, ILL.

The Novelty Pocket-Knife.

Your Name and Address on one side—Three Bees on the other side.

(THIS CUT IS THE FULL SIZE OF THE KNIFE.)

Your Name on the Knife.—When ordering, be sure to say just what name and address you wish put on the Knife.

The Novelty Knife is indeed a novelty. The novelty lies in the handle. It is made beautifully of indestructible celluloid, which is as transparent as glass. Underneath the celluloid, on one side of the handle is placed the name and residence of the subscriber, and on the other side pictures of a Queen, Drone, and Worker, as shown here.

The Material entering into this celebrated knife is of the very best quality; the blades are hand-forged out of the very finest English razor-steel, and we warrant every blade. The bolsters are made of German silver, and will never rust or corrode. The rivets are hardened German silver wire; the linings are plate brass; the back springs of Sheffield spring-steel, and the finish of the handle as described above. It will last a last-time, with proper usage.

Why Own the Novelty Knife? In case a good knife is lost, the chances are the owner will never recover it; but if the "Novelty" is lost, having name and address of owner, the finder will return it; otherwise to try to destroy the name and address, would destroy the knife. (If traveling, and you meet with a serious accident, and are so fortunate as to have one of the "Novelties," your POCKET-KNIFE will serve as an identifier; and in case of death, your relatives will at once be notified of the accident.)

How appropriate this knife is for a present! What more lasting memento could a mother give to a son, a wife to a husband, a sister to a brother, or a lady to a gentleman, the knife having the name of the recipient on one side?

The accompanying cut gives a faint idea, but cannot fully convey an exact representation of this beautiful knife, as the "Novelty" must be seen to be appreciated.

How to Get this Valuable Knife.—We send it postpaid for \$1.25, or give it as a Premium to the one sending us THREE NEW subscribers to the Bee Journal (with \$3.00). We will club the Novelty Knife and the Bee Journal for one year, both for \$1.75.

GEORGE W. YORK & CO.

St., Chicago, Ill.

*Please allow about two weeks for your knife order to be filled.

ESTABLISHED IN 1861 THE OLDEST BEE-PAPER IN AMERICA

41st YEAR.

CHICAGO, ILL., OCTOBER 17, 1901.

No. 42.

No Foul Brood—A Correction.—On page 627, we called attention to a reported case of removing foul-broody hives, combs, etc., from Michigan to Clyde, Ill., near Chicago. The owner of the alleged diseased material, mistrusting that he was the one referred to, called at our office for an explanation of the matter. We told him that our authority for the statement made were the foul-brood inspector of Michigan, and another man in that State.

He stoutly denied that any foul-broody material had been shipped by him, and said that the goods were still in the railroad car at Clyde, the car being unopened on account of some question about the freight charges.

In order that there might be no further cause for disagreement, we suggested submitting the matter to Mr. N. E. France, the famous inspector of apiaries for Wisconsin. He was immediately sent for. He came at once, and the owner of the car of bee-material, with Mr. France and the writer, spent several hours in examining very carefully all that the car contained, and found no evidence of foul brood whatever.

It seems that there were some foul-broody combs, etc., in the apiary from which the carload was taken, but those were not shipped. Hence, the unfortunate error.

We make the above explanation for two reasons: First, because we do not wish to accuse any man unjustly in public print; and, secondly, to show how easy it is to be mistaken.

As we did not give the name of the bee-keeper in question in our first reference to the matter, of course we omit it now. The carload of hives, frames, etc., was shipped from Rapid City, Mich., instead of Evart, as was stated on page 627.

We are more than pleased to have the matter as it has, as doubtless will be all the bee-keepers in and about Chicago; for there is already enough foul brood in this vicinity without importing it from another State.

But, all the same, there should be a law in every State prohibiting the removal of any apiary, or part thereof, without first securing a State certificate granting permission, and also assuring that there is no disease.

Old vs. Young Queens for Breeders.—Editor Hutchings calls for the experience of his readers as to the comparative value of old and young queens as breeders. In view of

the fact that H. Edwards, of England, says that all queens making a record have been reared from the eggs of a comparatively old queen. One would naturally expect that the time of life at which the offspring of any mother would have the greatest vigor would be at the time when that mother herself is in the greatest vigor. A queen can do little toward making a record for herself, usually, during the same season in which she is born, for few queens are born before the swarming-time, and the season will be well over before the entire force of the colony consists of her offspring. Her record will not be made before the end of the second season, and after distinguishing herself in her second season she is used as a breeder in the third season.

So it comes about that those who select the best to breed from will use comparatively old queens, and this may go far to account for the fact that Mr. Edwards' best queens came from comparatively old mothers. But if he had reared queens from one of his breeders while she was yet in her first year, and as yet had established no reputation, might they not have been just as good as those she produced a year or two later?

Prevention of Early Swarms. says the Bee-Keepers' Review, is secured by some Ontario bee-keepers by using bottom-boards of wire-cloth, the abundant ventilation at least retarding swarming. Some might like this better than raising the hive on blocks.

Position for Bee-Escapes.—Almost universally they are put in the center of the escape-board. It was suggested in the Bee-Keepers' Review that one corner of the board is the better place, because when bees become excited about getting out of the super they run around the edges. Yet E. W. Brown, of northern Illinois, reports that in cool nights a cluster of bees would remain in the center all night if the escape was in a corner. Perhaps the best way would be to have an escape in the center and one in the corner.

Plurality of Eggs in a Cell is nothing very unusual when a prolific queen is in a limited brood-nest, but the cells containing more than one egg each are worker-cells. It seems, however, that exceptional cases occur in which a normal laying queen will lay the second egg in a queen-cell, according to the following from *Gleanings in Bee-Culture*:

A rule that I supposed without exception was that, if you found more than one egg in a queen-cell, you might be sure of laying workers. The other day I found two eggs in a queen-cell and a good laying queen present. "Bees do nothing invariably."

Thickness of Top-Bars.—S. T. Pettit champions in *Gleanings* in Bee-Culture top-bars less than $\frac{1}{2}$ inch thick. He quotes a correspondent who says:

"For a number of years I have been using a top-bar $\frac{1}{4}$ inch thick and $1\frac{1}{2}$ wide, and not a burr-comb on a single frame in eight years' use."

This agrees with Mr. Pettit's theory that the width of the top-bar and not the thickness is the essential thing to prevent burr-combs; although Mr. Pettit himself finds it necessary to use a thickness equal to $\frac{3}{8}$ to prevent sagging. Mr. Miller says he still wants thick top-bars even if they make no difference about burr-combs, because the thick top-bars make so great a difference between brood-combs and sections that the bees will not carry up black wax to darken the sections. Mr. Pettit thinks this point can be gained better by using queen-excluders. Editor Root thinks that $\frac{3}{8}$ top-bars gave more burr-combs in their apiary than $\frac{1}{2}$.

Prevention of Winter-Breeding.—An article from Wm. McEvoy, in the Bee-Keepers' Review, gives his way of preventing the bees from beginning to rear brood in January when wintered outdoors. He thinks that by preventing the bees from starting brood-rearing in January—a thing that often occurs with bees wintered outdoors—"we not only save stores, but the lives of many of our best colonies, which often dwindle down and end in spring from the large amount of brood-rearing that they do at a time when they ought to be at rest." His plan of prevention is to crowd each colony upon five combs about the first of October, each one of the five combs being sealed right down to the bottom. If any combs are unsealed, he feeds till the bees will take no more. This leaves no room for brood-rearing.

Cane vs. Beet Sugar.—Some discussion has taken place with regard to the propriety of using refined beet sugar for feeding bees, and some bee-keepers have felt uncomfortable because they had no means of determining whether granulated sugar was made from cane or beets. Bee-journals across the water have insisted that sugar made from beets was not safe food for bees. The following letter in *Gleanings in Bee-Culture* seems to teach that beet sugar is all right:

Mr. Huber Root called my attention to an article published in *Gleanings* Aug. 15, and asked me to read it and give my opinion of some of its statements. The writer, W. K. Morrison, seems to think that sugar made from cane is better than that made from beets. I do not know how he or any one can know when he gets granulated sugar whether it's made from cane or beet. Of course, if he

sees the name of a sugar-factory of Nebraska, Colorado, or Michigan, on the sack in which it comes, he knows that he has beet sugar, but otherwise there is no way of knowing, for, even though it be from the refineries of Havemeyer or Arbuckle, it may be from either source, for these refineries handle raw beet sugar from Germany, Belgium, Holland, France, Austria, and Russia, as well as raw cane sugar from Java and the Indies.

One of the statements of the writer is that cane sugar is sweeter than beet sugar, "just as Jersey milk is richer than Holstein milk, and for this reason alone it commands a higher price." In the first place, I will say that cane sugar does not command a higher price than beet sugar; for in determining the price of sugar there is no question of its source, but of its quality. In the next place, I will say that the sweetness of sugar, from whatever source, depends upon its polarization of purity of sugar. As the chemical formula of sugar from both sources is the same ($C_{12}H_{22}O_{11}$), and their physical characteristics are both the same, it results that neither one nor the other can be said to be sweeter. The simile can not hold for the reason that, while sugar is a fixed chemical compound of so many atoms of carbon, hydrogen, and oxygen, with certain physical characteristics resulting from the atoms of the molecule uniting in a certain way, milk, on the other hand, is a variable body, and this combination of many chemical compounds; and while the slightest variation in the component parts of the molecule of sugar would make it other than sugar, there can be a great variation in the composition of milk, and it would still be milk. It might contain more or less water, more or less casein, more or less fat, etc., and yet it is milk.

The writer of the article claims that Dr. Wiley says that beet sugar is cane sugar, and cane sugar is beet sugar. I do not think that Dr. Wiley could say that. He might say that they are identical, or that beet sugar is cane sugar, but not that cane sugar is beet sugar, for the reason that "cane sugar" is the common name of the article which is chemically known as "sucrose," just as "grape sugar" is the common name of the article chemically known as "glucose." The name "cane sugar" was given at a time when the only known source was cane; but since then it has been found in other grasses besides the cane, and in a number of roots, as the carrot, parsnip, turnip, and notably in the beet. The writer of the article further states that, by the "same process of reasoning, saccharin, which is 500 times sweeter than ordinary sugar, ought to be cane sugar also, but it is not." I should say it is not! Saccharin is not a sugar at all, having none of the characteristics of sugar except that in a dilute form it gives a sensation of sweetness to the tongue, while in concentrated form it would be very bitter, and it is, in no sense a food, as is sugar. I do not know what he means by "the same process of reasoning," but certainly no process of reasoning could class saccharin as sugar.

MEVIN R. GILMORE,

Supt. of Exhibit of the American Bee Sugar Association at the Pan-American Exposition, Buffalo, N. Y., Aug. 31.

It seems that after reading this letter one may feel easy about the matter, especially after the following assertion of Editor Root.

I will reiterate what I have repeatedly said in these columns, that beet sugar, such as we have used for the last 20 years for feeding our bees, has been eminently satisfactory.

The Best Hive Cover.—There has been some pleading for a hive-cover that would not leak, warp, or twist. A strong cleat at the ends will prevent warping, but it will not prevent twisting. Two thin boards with an air-space between them, the grain of the one board running at right angles to the grain of the other, the whole covered with tin or water-proof paper, will probably solve the problem, the air-space at the same time making the cover warmer in winter and cooler in

summer. The demand, however, for a cover of this kind is not as general as might be supposed. Gleanings in Bee-Culture says:

Some days ago Mr. A. Albert sent some samples of covers, such as I described, to a number of prominent bee-men, as well as dealers, located in various parts of the country. A good many of the replies have now been received; and nearly all favor a single-board cover in place of the double board with air-space. Indeed, the Excelsior cover with sides and ridge-board is considered quite good enough. This is a surprise, as it seems to us that a double cover would be better on all accounts.

Westward Ho!—Editor Root predicts that within 10 or 20 years the larger amount of honey will be produced west of the Mississippi; intensive agriculture making bee-keeping less and less profitable in the East, while in the great West there is much land that can never be cultivated, but will produce good crops of honey. We'll see.

Getting Combs Built to Bottom-bars. says J. C. Detwiler, in Gleanings in Bee-Culture, is easy with wired or unwired frames, by using them in S-frame hives in upper stories. That has been well known for a long time, but Editor Root might have taken space for a footnote to say that in most cases it would be inconvenient, and in some cases impossible to use such frames in upper stories, leaving the advocates for foundation-splints perhaps the only ones who can get combs directly built to the bottom-bar without sagging in a lower story.

Wanted—A Foul-Brood Law and Inspector.—An Illinois subscriber, who finds good reason to suspect that some serious disease is getting a foothold in his apiary, says that disease akin to foul brood is by no means uncommon in his locality, and adds:

"We, as well as the rest of the State, badly need a law and an inspector, the same as Wisconsin or Michigan has."

Some bee-keepers will not agree with him. One will say:

"I've been keeping bees 25 years and have never seen a case of foul brood, pickled brood, black brood, or any other kind of brood but healthy brood. What's the use of being to the expense of an inspector so long as the disease is not known in the State only in exceptional localities?"

To this it may be answered that one reason for the need of an inspector is the fact that without an inspector the source may exist and flourish for a considerable time in any given locality without its existence being generally known. It may be a great deal cheaper—undoubtedly it is a great deal cheaper to have some one constantly on the lookout to prevent the spread of foul brood, than it is to stamp it out after it has obtained a firm foothold. It is better to be at the expense of insurance than to run the risk of being burned out. Decidedly, our correspondent is right. Illinois ought to have the law and the inspector.

The Chicago Convention, to be held at the Briggs House, corner of Randolph St. and Fifth Ave., on Thursday, Dec. 5, promises to be something of a revival of the old Northwestern. It is hoped that all who can do so will arrange to attend.

Weekly Budget.

DR. C. C. MILLER, and his sister-in-law, Miss Emma Wilson, were in Chicago on Thursday of last week, attending the American Sunday-School Missionary Conference, where Miss Wilson read a most thoughtful paper on "Quarterly Examinations in the Sunday-School." Both Dr. Miller and Miss Wilson are enthusiasts along Sunday-school lines, and are already leaders in certain important things in that direction. They find that Sunday-school work combines well with bee-keeping. At any rate, both are successful in their devoted hands.

A MAGAZINE FOR COLLEGE MEN.—"The Business Side of a Great University," by President Harper, of the University of Chicago, is the opening article in the College Man's Number (Oct. 12) of the Saturday Evening Post, of Philadelphia, Pa. "Theodore Roosevelt, Harvard '80" is the title of an entertaining paper on the President's college life, by his friend, Owen Wister. Other strong features of this number are short stories by Max Adeler, Jesse Lynch Williams, and Frank Norris, and a page of droll "Nature Studies," by Oliver Herford. This number will be of unusual interest to all college men.

MR. N. E. FRANCE, of Grant Co., Wis., when here to make the inspection referred to on the previous page, of course called at our office. He reports about half a crop of honey in his apiaries this year. He also said that there would be less foul brood if all bee-keepers would read the bee-papers. Quite a testimonial to the value of such publications. Mr. France is doing excellent work in his position as inspector of apiaries, but labors under many difficulties. His pathway will have to be made easier, or he will decline to continue in the work. Wisconsin bee-keepers can never repay him for what he has done in their interest. Neither can they find another man who will be likely to do the work so well, and with so little friction all around.

Reviewlets from the Bee-keepers' Review.

A BUNCH OF GRASS put on top of the fuel in a smoker cools the smoke, and prevents the discharge of any sparks.

KEEPING A RECORD of each colony, the breeding of the queen, her age, the amount of honey stored, any peculiarities of the colony, etc., has its greatest use in enabling one to select the best stock for breeding purposes. Some use a book; the only objection to a book is that the leaves are likely to become stuck together with propolis. By using abbreviations, a great deal of information can be crowded into a small space.

CAPPINGS, at the J. B. Hall apiary, are allowed to fall into a wire-cloth basket of such a size that it just fits nicely into the solar wax-extractor, and when the basket becomes full it is put into the extractor and another used to catch the cappings. There is no need of waiting for the cappings to drain out together with propolis. By using thoroughly, as the honey is not lost when put into the solar. It is necessary, however, to shade the dish in which the honey and wax are caught, or the heat of the sun will discolor the honey.

Contributed Articles.

Quantity of Nectar in Blossoms—Water Used by Bees.

BY C. P. DABANT.

DO all the blossoms yield nectar that are visited by the bees for nectar? In other words, are the frequent visits of bees to blossoms out of which they secure no pollen an indisputable evidence that they are gathering nectar from these blossoms? This is a proposition just being debated between two progressive apiarists of France—L'Abbe Multier, president of the Association of Bee-Culture of Haute Marne, and G. Collot, the editor of the monthly "L'apiculture Pratique."

L'Abbe Multier holds that in his section of country, although the bees work faithfully upon the basswood bloom, they never or almost never harvest any nectar from this tree. He holds, that although the basswood blossoms attract the bees, they go there and remain, in a sort of drunken spree, for hours together, as the drunkard in a bar-room, while the bees that go to other blooms go back and forth, from the hive to the field, and vice versa, over and over without stop.

If the above-named gentleman had not in many instances shown his observing mind, one might be tempted to think that he misrepresented matters, but that is out of the question. He is not the first who has noticed that the bees may spend much time on blossoms without apparent results, for Editor Bertrand, of the "Revue Internationale," had, years ago, seen the bees eagerly at work upon the blossoms of the Eryngium Giganteum, and had ascertained that they secured nothing worth mentioning. He had marked some of the workers while upon these blossoms with a slight flour-dust, so as to be able to follow them in their flight, and had actually seen the same bee on the same bunch of blossoms, working faithfully and busily, for five consecutive hours. It is very evident that the quantity of nectar secured, though sufficient to keep up the life of the bee, was so insignificant as to leave its honey-sac unfilled. I mentioned this fact in my letters from Switzerland last year, in the American Bee-Journal.

When the Echinops Spherocephalus was accidentally discovered to be a valuable honey-plant (?), the gentleman who made the discovery noticed the numerous visits to the plant by the bees, and sat down to an experiment as did Mr. Bertrand, only, instead of marking a bee and watching it, he marked a blossom and watched it. It appeared, if I remember rightly, that the same blossom was visited some 1600 times by bees during the same day. This experiment, reported to the North American bee-keeper's congress, brought the Echinops before the public in the United States, and a general rush was made towards the production of this plant. But it was since ascertained that not only was this a noxious weed imported from France—a sort of dwarf thistle—but it was also found, that, although the bees were always upon it when in bloom, yet no apparent results were secured. At least this is the final verdict, as far as I have heard. Mr. Bertrand, through his experiments in Switzerland, had already come to this conclusion, and had discarded both the Echinops and the Eryngium as not worthy of cultivation.

In the case of the basswood, the accusation of uselessness is not to be considered, except in instances like the one I have mentioned, where the trees are not numerous, and the soil perhaps unfavorable. Many portions of America are plentifully supplied with basswoods, and show by their honey-crops that basswood honey is not a myth. Numerous towns, cities and counties in the United States are named after the basswood tree, and in many of these the crop of basswood is almost as regular as the crop of clover honey in others. And the odor of the basswood honey, as well as its taste, can not be mistaken for any other. It is stronger in flavor than the perfume of the blossom whence it is produced, and its smell is no longer a perfume, but a rank and almost disagreeable odor, which has caused its being classed as secondary in quality.

But the fact that the basswood bloom is evidently a useful honey-producer does not, after all, destroy the evidence, that in many cases the bees work upon blossoms

which attract them by their pleasant smell and retain their attention by probably supplying them with enough nectar to please their palate, without giving them a sufficiently remunerative quantity to make these blossoms desirable or entitle them to a place among our domesticated plants.

But plants and trees which furnish a supply of honey in certain localities under certain conditions, prove useless in other places, and it is for the apiarist to ascertain the resources of his situation and act accordingly.

DO BEES USE WATER TO COOL THE HIVE?

I see the above question put by J. A. Gerelès, page 566. In this article Mr. G. explains that he has lost a number of colonies from the combs melting down, and that he was told that the want of water by the bees was the cause of this. Let me give him our experience on the subject.

In 1878, if I remember rightly, we had established an apiary of some 80 hives of bees at the farm of an old French gardener, about six miles from our home. The hives were in the yard near the house, and only a few of them sheltered from the rays of the sun by apple-trees. A small number of the hives had roofs, the others (new hives) were not sheltered in any way, for we had never before experienced any loss from heat, and had no idea of the possibilities.

During that summer the crop was tremendous, and we were distressed by the bees. We could not put up our honey-boxes fast enough to keep the bees with room, and the combs were exceedingly heavy. I remember going to that apiary at one time with six or eight extracting supers, and being unable to give more than three or four empty surplus combs to each filled hive, and these combs were all filled at my next visit, a few days later.

These bees needed no water supplied to them artificially. There was a large creek in close proximity, and they have always gotten along finely at that place on their own resources in that line.

One day during the hot weather, I received word by a messenger sent by my old friend, the gardener, that something was wrong in the apiary, as the bees were in an uproar. I was unable to go there for two days, in spite of his warning, and when I arrived on the third day I found five hives entirely empty, and some 15 others with from one to five combs broken down. The bees in the partly damaged hives were already rebuilding combs over the mass of piled-up broken combs, mixed brood, pollen and honey. But the five hives that had broken down entirely had nothing left but a pile of debris, dead bees and rotting brood. Remember that all these hives had supers on, some one, some two—supers of our large-size Quinby, containing when full some 60 or 65 pounds, and the body of the hives probably contained as much. All this was gone, and very certainly the most of it had run into the ground.

It was at this time that we began using straw mats over our hives, that is, over the oil-cloth, at the top of the hive and under the cap, summer and winter, and it was on the suggestion of our old friend, the gardener, who had been used to straw mats all his life when gardening in Paris. He knew how to make them, and made for us a large lot; he said that in Europe they used them to keep away the frost, to shelter their plants from the heat of the noon sun, to cover their glass hot-beds on cold nights, and for many other purposes connected with gardening.

We have used these mats ever since. They not only keep off the heat of the sun in summer, but they retain the heat in the winter. They are good non-conducting shelters, and absorb moisture. We make them of what is known here as "slough-grass," "marsh-grass," the botanical name of which I believe to be "Spartina," a tall, wiry grass well known to any one who lives along the Mississippi. This material is stronger and tougher than straw, and mats made of it would last for ever if we could only bind them with indestructible twine.

We had made also, some of these mats, of large size, two feet high, by six or seven feet in length, and had used them to wrap up our hives for winter. But they were so cumbersome that we had to pile them up in a shed, and the rats and mice destroyed the cord with which they were made. I believe it would pay to keep such mats in a safe place so as to use them for wintering.

But the straw mat is not the only thing that we have used to prevent a recurrence of the accident above mentioned. Whenever the hives suffer from the heat, we raise them from the bottom-board so as to give plenty of ventilation. This we think is as necessary as the use of a shelter from the sun. We also use roofs (portable roofs made

of rough boards) over all of our hives, and since we have used these precautions we have not had any accidents of this kind to suffer.

Hancock Co., Ill.

Exhibit of Bees and Honey at a Fall Festival.

BY JOHN R. SCHMIDT.

A NOVEL and interesting exhibit in the Pure Food department of the Cincinnati Fall Festival was the display made by Mr. C. H. W. Weber.

In a tastefully decorated booth a complete line of bee-keepers' supplies, consisting of the latest hives, utensils, and everything of imaginable use in the pursuit of modern bee-keeping, together with a nice display of comb and extracted honey put up in a most inviting and catchy way, was shown.

The exhibition attracted such universal attention, and was so much admired by the thousands of visitors, that it might be well to go into details somewhat as to its make-up, thereby possibly enlightening some interested readers who may improve upon the same at the next fair or exhibition coming his way.

The display being in a corner of a building, the two white-washed walls were well hidden behind a mass of choice comb honey in cases, tiered up over five feet high. Between each tier of cases, bottled honey was arranged, showing the different sizes, and also the special registered labels, a distinct marking for that kind of honey only. If proven otherwise, a \$100 offer is yours, puts some significance into the meaning of these labels. The honey-cases and bottles were surmounted by numerous one-pound cartons colored a light lavender on two sides, and lettered in gold, signifying the contents a gilt-edged product.

Potted plants (natural palms) furnished by a florist, and well placed about the display, added much to the appearance and helped to enliven the exhibit; not to say a word about the bees, which made a "hot time" caused by the ever mischievous boy, this time with a sharp lead-pencil, which pried apart the wire meshes at the entrance and allowed bees to escape before being discovered. Luckily, only one souvenir was carried away.

The three well-known hives, viz.: 8 and 10-frame dovetailed, Danzenbaker, and the Langstroth portico, all complete and painted a spotless white, making them look as neat as a pin, were placed near the rear wall, where they showed up to good advantage. The Cowan extractor, comb foundation, supers, smokers, and many small articles too numerous to mention, made up what may be called the foundation of the exhibit. Last, but not least, each telephone subscriber was furnished with an extra instrument in his exhibit free of charge, thus establishing perfect outside communication with almost every booth in the building, through a miniature exchange, which was on exhibition and illustrated the working of this wonderful instrument. This highly appreciated convenience came in especially handy when the bees escaped, for it was telephoned instantly to the office, and help was soon on the scene.

The most conspicuous place of the exhibit—the front—was occupied by two small tables, one of which contained a model 8-frame dovetailed hive having four glass sides. This hive was perfection in the full sense of the word. It contained a full colony of plain 3-banded Italian bees upon 8 frames of comb, with brood, honey and everything just as you would find in any prosperous colony. The upper story consisted of a 4 $\frac{1}{2}$ x 4 $\frac{1}{2}$ x 1 $\frac{1}{2}$ plain section super, with fences partly cut away on either side to show the sections of honey in the various stages of completion.

In order that the queen might be seen at all times, a one-frame nucleus was shown, making it easy to keep track of this important individual.

Another nucleus illustrated the rearing of a queen-bee from the tiny egg to the matured product ready to begin her supreme reign, or be sent through the mails in one of the well-known cages. This was also shown and fully explained.

It may not be unwise to say that these observatory hives were very attractive in appearance, which was largely due to the perfect workmanship. Instead of being painted they were nicely varnished. The top, lower-story and bottom-board were held securely together with nickel-plated fastenings, giving the whole a handsome appearance. Double-weight glass on the sides and ends of the full colony, and on the sides of the nuclei, made things as plain as day, and revealed the mysteries of the bee-hive to hundreds

with their strange, and, many times, ridiculous questions.

Now, thoroughly aroused as to how bees "make" honey, the interested observer passed on to the other table, where a neat and polite young lady attendant was in charge of two large glass vessels of honey, distinct in quality and flavor, viz.: the famous Colorado alfalfa, and white clover honey. Each who wished to sample was provided with a small, flat piece of white basswood, which served as a spoon. After once used, the piece was done for, and dropped into a receiver. This method not only avoided a lot of mussy work, but was extremely sanitary, and many sampled the honey who otherwise would not have done so. Quite a number of orders were booked for delivery, not saying anything of the one-pound sections and the bottles sold every day at the exhibit. On an average about three gallons of extracted honey was consumed every day from the sample table. Each little stick held, at most, half a teaspoonful of honey (many times less), so it is easy to imagine how many dips were necessary to take away three gallons of honey.

After the first day it was found absolutely necessary to restrict some of the children "unaccompanied by parents" who were especially fond of honey, for they actually could not decide on which should be the last dip.

An unusual and unexpected coincidence developed in the form of a biscuit-baking booth next door, which advertised a well-known flour, and gave away hot biscuits and coffee. The hot biscuits and the honey soon developed a mutual attraction, to the tune of several hurry calls over the telephone for "More sample honey to the exhibits! Quick!" A fortunate misfortune which may be answered by yes and no.

The exhibit was a success in every way, and the howling success of Cincinnati's great annual show was largely due to the exhibitors taking such an interest in their exhibits, as this one did in his. May it only serve its purpose well, and help bring "more business" to the bee-keeping industry, as well as in other pursuits.

Hamilton Co., Ohio.

How I Managed a Swarm of Bees.

BY DR. E. GALLUP.

ON April 19, I caught a medium swarm of bees. Now I propose to tell, for the instruction of the beginner, how I handled those bees.

I hived them on six empty frames. After seven days I began to move the outside frames, one at a time, into the center of the cluster, so the queen would occupy it with eggs, and have the bees build all worker-comb. It had a young queen and probably was a second swarm. Bees left to themselves, especially with an old queen, usually build more or less drone-comb at the outside of the cluster.

On May 24 I had 14 frames all filled with worker-comb, and the queen had occupied them as fast as built.

On May 13 I moved the queen and two frames of brood into an empty hive, moved the old or first hive about the width of it to one side; set the hive containing the queen near enough to the position of the first hive so as to throw

OBSERVATORY HIVES AT THE CINCINNATI FALL FESTIVAL.

the most of the working force into the new hive; placed an empty frame between the two full ones, and adjusted the division-board. I sent for an Italian queen for the old hive.

Now, I have two boys, one 12 and the other 14; both are anxious to learn about the bees, so I have opened both hives three and four times a week, and sometimes twice a day, to take out the combs and show the bees at work, the queen depositing eggs, how the workers unload their pollen, etc.

The bees are hybrids. One scarcely finds a swarm that is not more or less crossed with Italians.

In examining those bees we have not used a bee-veil or one particle of smoke at any time. Now, if I should, as most bee-keepers recommend, puff smoke into the entrance, we should disturb them and stop their labors entirely for the time, but as we handle them, they keep right on at work, and they are not disturbed a particle. If every time we looked at them, we annoyed them with smoke, we should soon have them so cross that it would be dangerous for the children to go about them.

When I had 125 colonies about the house, I never had my own or the neighbors' children stung by them at all. We never open a hive too early in the morning, nor too late in the evening, when the weather is too cool.

I commenced this article some time in May, and it is now Aug. 3. It was mislaid and forgotten.

Always have your smoker ready in case of any mishap. But I could never see the necessity of the first thing puffing smoke in at the entrance, whether it is required or not. It looks to me like carrying your whip, and every time you approach your horse or cow, give them a good, smart cut with it for fear they will kick or hook. When I use smoke I use but a little at the top of the hive. Let the bees keep on at work, out and in at the entrance. By so doing we can keep them gentle.

I admit that there is occasionally a colony that one can hardly keep down, no matter how much smoke is used, but I will not keep a queen that produces such bees. It does not pay.

I now have 10 laying queens and a good, strong nucleus. All the combs have been built worker-comb except one that was built while the bees were rearing a queen. I had one colony given to me, one that I paid 25 cents for, and one that I paid 50 cents for. I have transferred about 10 frames full of ready-made worker-comb, all the rest having been made without foundation. Bees are yet sending out natural swarms. One went into the corner of a large fruit-packing house on July 21, between the outside and chimney. Being too much trouble to get them, I let them alone.

Bees that were in good condition have done remarkably well. The honey season is nearly over now. The loss in the three dry years that have passed has been very heavy in the mountain apiaries where there was no irrigation. They will work in the valley until into September.

Orange Co., Calif., Aug. 3.

Preparing Bees for Winter—A Conversation.

BY G. M. DOOLITTLE.

HELLO! what are you doing with the bees this morning? I supposed all work with them was over for this year."

"In this you are mistaken, Mr. Smith; for, in my opinion to reap the best results in wintering bees, September is the month in which they should be prepared for winter. This gives them a chance to get their stores for winter placed just where they wish them, so that, by the latter part of October, they are ready to go into that quiescent state which is always conducive to the best results."

"Well, this is something new to me, as I always thought November would do very well as to time to fix the bees for winter. But what do you do now by way of preparation?"

"The early preparation consists in opening each hive and seeing that each colony has a good queen, plenty of bees, and, most of all, plenty of stores."

"How much do you calculate for stores?"

"I allow 25 to 30 pounds for each colony, which should be in the hive from September 10 to 25."

"But suppose some colonies do not have that much."

"If there is not so much as this, feeding must be resorted to; and if we have to feed, it should be done in September, surely, in order that the bees may cap it over before cool or cold weather; for uncapped stores often sour and get thin during winter, thus causing disease. Multitudes of bees are lost yearly, where feeding is put off till

October and November, by being obliged to eat poor, thin stores, this causing bee-diarrrhea on account of the bees not being able to hold their feces, because they can not evaporate all the water out of their food, it being so thin."

"But suppose the bees are still getting honey from the fields."

"In places where fall flowers abound, so that the bees are storing at this time of the year, of course they should need no feeding if the apiarist manages rightly."

"Do you think if one needed feeding all would?"

"This is to be ascertained by looking them over, as you see me doing. If I find some colonies are heavy with stores while others are light, the light ones can be fed by taking from the heavy; and if there are some light in stores after so equalizing, then we feed what still remain without a sufficient supply."

"Having all fixed as to stores, etc., what next is to be done? I wish to learn."

"The next thing to do is to put on the quilt, where such is used, and over this the sawdust cushion, or whatever packing material is used, thus tucking them nice, snug and warm for the winter."

"Do you use common enameled cloths for quilts?"

"I do not during winter. Some so use, but the most of our practical bee-keepers prefer some porous substance, like woolen blankets, pieces of old carpet, or something of that kind. For colonies to be left on summer stands, I use chaff hives, which chaff is left on in the hives both winter and summer. Over the tops of the frames I prefer a quilt, as just spoken of, and on top of the quilt a cushion two or three inches thick, made of common factory cotton cloth, filled with corkdust, if possible; if not, then filled with dry basswood sawdust. Such cushions tend to keep the bees in better condition than anything else I am acquainted with. The corkdust allows the moisture to pass up through it and out at the top of the hive, while the basswood sawdust will absorb nearly its bulk in water, so that either keeps all dry, warm, and nice."

"Do you do anything else by way of preparation?"

"When winter sets in, a board about 8 or 10 inches wide should be set up slanting from the alighting-board to the hive, in front of the entrance, so as to keep out snow and cold winds, as well as to shade the front of the hive, where the hives face south, as they should during winter, so the bright rays of the sun shall not entice the bees out when it is too cool for them to fly."

"Do you winter all your bees outdoors?"

"No. I prefer to winter a part of the bees in the cellar, for I like the idea of 'mixed wintering,' as by this plan no extreme loss is likely to occur; for a winter which is severe on the bees out of doors is generally good for cellar-wintering."

"At what time do you set the bees in the cellar?"

"Somewhere about the middle of November. At any time between the 10th of November and the 1st of December, when the hives are dry, and free from frost, I set them in. If they have a flight along about this time I set them in the next day, if it does not rain, so the hives are wet; and I find that this can be done, even if the weather is quite warm, much better than it can on a cold morning when the hives come up from their stands with a jar from having been frozen down."

"Do you give each hive a separate stand when in the cellar, or set them on a plank which will hold several hives?"

"Neither. A cellar stand is made by nailing four pieces of six-inch boards together so they shall be of the right size for a hive to rest on. This raises the first hive six inches off the cellar bottom, and away from the damp air which is generally found right at the cellar bottom. The first hive is set on this stand, when hives are piled on top of the first till the floor is reached, so that each stand holds from three to five hives, according to the depth of the cellar. In this way the cellar is filled (if I have colonies enough), except a passageway through the center to the back end, through which I pass every two or three weeks to see if all is right so far as temperature, mice, etc., are concerned. Otherwise they are left undisturbed during the winter."

"At what temperature should the cellar be kept?"

"Here practical bee-keepers differ; but I have had the best success with a temperature of from 43 to 45 degrees, or as near that as can be had. With a cellar in a bank, separate from any building, the keeping of the temperature at this point is quite easy; but with a cellar under a room or building it is not so easily done, for the changes from the outside have more effect on the interior of the cellar than

they do where the cellar is wholly under ground in a bank or side hill. There are other things which might be said on this wintering subject; but with your consent we will leave them till December, when I am not so busy, when, if you will come over, we will talk them over more at length."

Burr-Comb With Honey Between Super and Brood-Frames.

I am a beginner in bee-keeping, having 16 strong colonies in hives having 8 Hoffman frames with $\frac{7}{8}$ -inch top-bars, with Ideal supers for section honey, and I am bothered very much with burr-comb full of honey being built by the bees between frames and supers; built so solid that it was impossible to take off supers without lifting the frames, although the bees had plenty of room in the supers for storing honey. What will prevent bees from building burr-comb and storing honey between frames and supers?

SUBSCRIBER.

ANSWER.—Is the space between each two top-bars and the space over top-bars $\frac{1}{4}$ inch or a shade less? If so, there should not be very much trouble with burr-combs. I hardly know what can be the trouble. Perhaps there was an accumulation of burr-combs over the top-bars from former years. If there are burr-combs over top-bars when you put on supers, you may be sure the case will not be getting better, but worse all the while. In any case, the burr-combs are there now, and if let alone will be there in worse condition next year. Before putting on supers next year, scrape the tops of the top-bars clean with a sharp garden-hoe. Put your foot on the top of the hive at one end, and hoe toward you. Let an assistant play the smoker to keep the bees down out of the way.

Foul-Broody Frames—Moving Bees a Long Distance.

1. Can frames from foul-broody colonies, after the wax and honey have been melted out in a solar extractor (the heat of which is so intense as to cook eggs hard), be safely used in the apiary again?

2. What is the best and safest way to prepare bees (in 8-frame hives) for moving by rail a distance of 500 miles, in April?

UTAH.

ANSWERS.—1. I think it would be safe to use such frames again, although very unsafe to use the honey again, and consequently unsafe to use the frames if any honey were left on the frames. That excellent authority on foul brood, Wm. McEvoy, tried to make it very clear to us at Buffalo that it was safe to use, without disinfecting, hives that had contained foul brood. Other authorities have insisted that it was unwise to use such hives, but the fact that under Mr. McEvoy's instructions at least 5,000 such hives have been used with no evil results, makes it seem practically safe to use them. So I conclude that frames with no honey on them might be used without harm. While I think it might be safe to use such frames, I do not think it advisable. Mr. McEvoy advises using the hives and burning the frames, of course saving the wax.

2. The two items in the preparation are to provide abundant ventilation, and to provide against moving of the frames. One way is to provide ventilation by means of wire-cloth to cover the entire top of the hive, having a frame two inches deep on which the wire-cloth is fastened. If fixed-distance frames are used, all that is necessary to fasten the frames in place is to put wedges between the dummy and the frames or side of hive. If loose-hanging frames are used, you may wedge, between the frames, sticks long enough to reach to the bottom of the hive and project above the top-bar. Or, you may fasten the frames in place

by driving small nails into each end of each top-bar, not driving the nails entirely in, but leaving them out enough so they may easily be drawn after the journey is over.

It will be well to study up what is said in your textbook on the subject.

Drones—Honey-Boards—Sweet Clover, Etc.

I have an apiary of 60 colonies that I am running for pleasure and a desire to study the nature, habits, etc., of the honey-bee. I have nearly all the standard books on apiculture, but can't solve many little things that develop, and therefore I have to apply to our best authority, and wish to ask:

1. Why is it that several of my colonies lately have turned out a full force of drones, after killing them off in July, as is their customary habit here and elsewhere?

2. I don't think I have seen a drone since some time in the latter part of July (it is now Sept. 23), and a few days ago I was strolling through my apiary, and all at once the peculiar note of a drone on the wing attracted my attention, and, on examining, I found the place alive with them, but they seemed to be confined most to certain box-hives, but are again being driven off by the bees. How do you account for this?

3. Some of my colonies are storing honey in their supers, while the majority of them haven't stored any after the principal flow closed, which is generally about the last of June here. I have tried baiting them, still they seem to be busily engaged, and carrying in pollen.

4. How would a piece of a crocus-sack do for a covering for supers to act as a honey-board? Is there any objection to it?

5. How do you prevent the honey-board being stuck to the top of the frames?

6. Suppose you use a piece of crocus-sack for a covering in place of a honey-board, would it be a good way to give the bees air to raise up the top by placing two cross-sticks under the top, raising it an inch or so? Would that interfere with comb-building?

7. Will yellow and white sweet clover yield nectar in this climate? If so, how long after sowing? When is the best time to sow it?

MISSISSIPPI.

ANSWERS.—1. I don't know. I may give a guess at it. It is possible that in your locality, as in many others, you suffered from the terrible July drouth, causing the bees to kill off their drones. Then when rains came and started up a moderate honey-flow, eggs were again laid in drone-cells. It must be remembered that each year about one queen out of three is superseded, and this superseding is usually done somewhat late in the season, so if a colony with a superseding turn of mind had been left by the July drouth without any drones, there would be nothing left for them to do but to rear some.

2. A difference in conditions accounts for the difference in behavior of different colonies. A colony with a young queen might be likely to rear no drones after July, while a colony with an old queen that it was trying to supersede would be sure to rear them. At the time you saw them the bees were probably killing off the drones for good, and at such times the drones being driven out of the hives make an unusual show of numbers.

3. I suppose you'd like to know why such difference. Well, there may be a difference in the industry of colonies. That of itself is answer enough. The condition of the brood-nest may also make a difference. One colony had an old queen which did not lay well, and instead of keeping its combs filled with brood in June filled them chiefly with honey. Then it superseded its queen, rearing a young and vigorous one which not only filled all the vacant cells with eggs, giving no chance for storing below, but obliged the bees to carry up some of the honey previously stored in the brood-chamber. Another colony had a queen that laid profusely during the first part of the season, allowing very little honey to be stored in the brood-nest. As the season advanced the queen let up in laying, and the vacant cells left by the hatching bees were largely filled with honey, leaving no honey to be stored above.

4. I don't know what a crocus-sack is, but it is likely some kind of cloth, so coarse that bees could pass through the meshes. Very likely the bees would spend a good deal of time trying to tear it down, and use a good deal of propolis upon it. A few years ago I discarded honey-boards altogether, having nothing whatever between the top-bars and the super above. You will probably be pleased if you

make such a change; but you must allow only $\frac{1}{4}$ inch or a shade less between the top-bars and the sections or frames in the super. It will also be a help to have only $\frac{1}{4}$ inch space between each two top-bars, which space you can secure by nailing strips on each side of your top-bars if they are too narrow, and most bee-keepers also think it desirable that the top-bars be from $\frac{3}{8}$ to $\frac{7}{8}$ inch thick or deep.

5. By having the space between top-bars and supers a scant quarter of an inch. You can also prevent it by doing away with honey-boards altogether.

6. Letting air directly into the super has the effect to make slower work in building comb wherever the air enters. So it is objectionable for comb honey, but is a good thing for extracted honey.

7. They are of such universal adaptation that almost certainly they will succeed with you. You may sow in fall or spring. They will grow the first year without blossoming; the second year they will begin blooming before white clover is over, and not stop entirely till hard freezing weather; and the following winter they will die root and branch.

* The Afterthought. *

The "Old Reliable" seen through New and Unreliable Glasses.
By E. E. HASTY, Sta. B Rural, Toledo, O.

THE HIRED MAN IN THE APIARY.

Homer Hyde, when he wrote that excellent article on the hired man in the apiary didn't think that he was encouraging some of us to push right square against Almighty God. Why, Homer, the man you describe is a man that will not be allowed to be a mere hired man for any great length of time—that is, as a general rule he will not. A power above, that oft condescends to steer our little barks, will not allow it. If you have such a one, consider that you have a treasure lent you for a very little while—and don't kick (as Jeshurun in the Bible kicked) when the little while comes to an end. But while, as a general rule, we have to get along with hired men who have serious flaws, it is nevertheless true that the right kind of a demand will in time have a tendency to bring the right kind of a supply. At least the supply can be discouraged and kept off by idiotic conduct on the part of employers. See the farmers and their men. The supply is scant of men that will take a load to town and come home without danger of getting drunk and letting the horses run away. I have felt just amazed to see how easily farmers accept the danger, and how little extra they will offer, either of cash or other inducements, for strictly sober men. The employments that *will* have sober men and no others get them somehow. Page 564.

HONEY AND HONEY CONSUMERS.

And so black mangrove honey from Florida, notwithstanding its high quality and flavor, stirred up suspicion when peddled in a distant State where no one ever tasted just such a taste. Apparently Mr. Wallenmeyer has struck an important general principle. The ordinary customer wants one of the honeys he has tasted before—and fears a swindle else.

But it isn't a general principle everywhere that consumers object to buying as much as three pounds at one time. Living within delivery distance of a city grocery does seem to stimulate the disposition to buy by dribbles, but the main cause lies elsewhere. Most consumers consider buying honey at all as a *piece of extravagance*. They dash in desperately to the depth of half a pound; but would consider it wicked to go much deeper. The remedies are obvious, if we are willing to use them. In retailing extracted honey I use a five pound package, and am seldom asked for less. If I remember rightly we have heard from brethren who sell mostly in a 20-pound or 25-pound package—to substantial farmers who live far from town, and who usually have money in their pockets.

"Useful when empty" is a very important phrase.

Shot in every new bottle to break out the shelly, thin glass. Sure!

Could wish that all the pictures had turned out clear like the first one, so that we might learn the *exact* manipulation.

Good wife that will non-colloquially get dinner with 500 pounds of honey encumbering the range!

No sin to adulterate with paraffine your own usings of wax, if it makes it better.

Sealing inside, directly on the hot honey, looks rather like a novelty. Pages 564—566.

PROPOLIZING SECTION-TOPS.

Dr. Miller's third answer to Indiana's questions will bear talking about. He is doubtless correct that bees often daub the top of sections the worse when an enameled cloth is laid on. Angles with a crevice in the bottom of the angle always have to have some propolizing, unless the bees are awfully busy at something more important. In doing this job they ram the material home forcibly, with the result that the section tops are soiled quite a distance from the edge. There is another side to the question, however. Well, it's pretty apt to come about in fine weather, when no honey is coming in, that our don't-want-to-be-idle little servants will bring propolis and surface all new wood—surface it in such a workmanlike way that it can not be scraped off as mere hurried chinking can. Something to cover section-tops which can not be lifted readily is the desideratum where sections are to stay on the hive any great length of time. Page 568.

THE "ONENESS" OF CLAREMONT.

Happy Claremont! One church, one literary club, one horticultural society! I don't know but such a town ought to pray never to grow any bigger. I'm sure they have a right to pray a little: "Lord, we thank thee that we are not in the sin of split-up-edness as other towns are." Page 569.

BRITISH COLUMBIA BEE-KEEPING.

And so in British Columbia one man says bees can not find supplies—has tried it—and another man gets 60 pounds of sections. Page 571.

* The Home Circle. *

Conducted by Prof. A. J. Cook, Claremont, Calif.

CORONADO.

There are three places that every visitor of Southern California should certainly see before he leaves this fairest part of our country. I hardly need to say that one of these is Redlands, with her incomparable "Smiley Heights," wealth of verdure, beautiful homes, and show of thrift everywhere. That one is Santa Barbara, with its lovely bay, its splendid climate, matchless combination of mountains and sea, and its incomparable suburb, beautiful Montecito. I have just spent Sunday at the third, beautiful Coronado. This is across the bay from San Diego. The climate here is wondrous even for California; never hot in summer, never cold in winter. San Diego and Coronado enjoy and rejoice in one perpetual summer.

Off San Diego are two long peninsulas. The outer, Point Loma, stretches southward, is some miles long, and high and precipitous. The inner, Coronado, stretches northward more miles, is often very narrow, and is low and level. All of Point Loma holds the ocean from the beautiful Harbor of San Diego. Only the south end of Coronado feels the pulse-beats of the great Pacific.

Coronado Hotel, and Coronado Tent City, mark the limit where the ocean sweeps this peninsula. So it is opposite the point of Loma. On one side the huge breakers thunder along the shore; on the other the long, quiet bay nestles, and is in striking contrast to the restless, resistless ocean just a few rods across the very narrow stretch of land. The great ocean steamers, or the more powerful war vessels that are wont to enter San Diego Harbor, must round the magnificent Point Loma, then pass northward in the narrow channel between the two peninsulas, then round the extreme northerly point of Coronado, when they may drop anchor in the ever peaceful waters of San Diego Harbor.

Coronado Hotel is one of the grandest in the world. Its prices are equally renowned, yet the moderate purse may still enjoy this wondrous bit of Nature's rarest tracery. The same company that controls the great and far famed hotel, are likewise proprietors of Tent City, where neat-floored and carpeted tents can be rented very reasonably. A fine tent for three can be secured for \$25 a month. In this are good beds, all the utensils for light housekeeping, gasoline stove, dishes, table, etc. Table and bed linen are also furnished. A good and very reasonable restaurant may be made to supplement

the home fare if one desires. A good literary and reading-room, with all the papers and magazines, is free to all. A very fine band discourses most beautiful music each evening. All kinds of bathing—surf, still water, or indoor warm water plunge bathing are at the command of all. All the attractions of the great hotel are shared with the occupants of Tent City. For one of my simple tastes, Tent City offers as inviting a menu as does the great hotel. I know of no place in California, or elsewhere, where as much can be had to gratify wholesome desires as at this beautiful retreat at delightful Coronado.

CULTURE.

At the pretty little hamlet of Chula Vista, on the mainland opposite the south end of Coronado peninsula, I had the pleasure of being entertained by Judge A. Haines for two days the past week. At the dinner table one evening, Judge Haines, who has a family of delightful and promising children, two of whom are making an enviable record in college, remarked upon the tremendous importance of the parents gaining and holding the fullest confidence and sympathy of the children. To do this we parents MUST be able to enter fully into the plans, thoughts and feelings of our children; must give heartiest sympathy to all that pleases and interests them. This, said the Judge, is the key to all right training in the home.

I was greatly interested in his further remark, that the best use of education was to make us able to extend these sympathies. Nothing, said the Judge, will help us so much to give and gain this fullest and best sympathy, as will rich culture. Thus education, broadest and best, will, as its best fruit, make possible such training as will result in grandest men and women. Such will most exalt our citizenship, and most bless the world. Judge and Mrs. Haines' own home and family are the best proofs that his philosophy is correct.

The Judge made one other remark: Anarchy, whose foul presence has struck such a cruel blow not only at us, but the world, feeds on sensation and superstition. Culture is the

arch foe to both these blots of character. Culture, then, should rid us of the dastardly presence, that so seriously menaces our peace and safety.

EVERGREEN TREES.

The mother-love is one of the most holy and sacred of instincts. It impels the motherbird to fashion her nest where the younglings will be most secure against discovery and harm. Thus the pine and other evergreens are most sought for purposes of nest-building. Thus on every home grounds we may well plant a group of evergreens. I have only two lots for my home at Claremont, yet down by the barn I have a vigorous Monterey pine, Lawson cypress, Norway spruce, silver cedar, giant sequoia, and graceful arbutus vitae. Already the birds have found my grove and appreciated it for nest-building. Thus this grove has three advantages: It gives real beauty, gives a touch of evergreen landscape, brings the cheering, beautiful presence of our feathered friends. Hurrah for the little grove of ever verdant conifers!

THE GARDEN.

Every bee-keeper, every rancher, should have a garden. What a superb place to give the children the needed wholesome employment! What a chance to give them responsibility and opportunity to earn money that shall be all their own! What a rich addition it gives to the family table as the best corn and peas are only known to him who raises them in his own well-cared-for garden. What a rich pleasure for the family as a whole, to plan, plant and glean in this little best corner of the home grounds. With what pride we note the growth of the luscious pie plant and vigorous asparagus. A friend—a very busy man of Escondido—a great bee-section, has just told me how he helps the purse by his garden. He has only three lots, all told, yet his monthly income is very helpful. One month it reached \$29.80. His cabbages sold readily for two cents per pound, when lemons sold for only one cent.

✦ REVERSIBLE WALL MAP ✦ — OF THE — UNITED STATES AND WORLD,

WITH SPECIAL INSET MAPS OF

China, Cuba, Porto Rico, The Philippines, Hawaii, and Alaska,

Especially prepared to meet the demand for a first-class map that will give a quick, general idea of location of events the world over, and particularly to the United States and our territorial possessions. **Very useful in every home and office.**

66 x 46 INCHES IN SIZE.

ELEVEN BEAUTIFUL COLORS.

**Best and Most Necessary Map
Ever Issued.**

**No Home or Business House
should be without it.**

The **XX** Plates

are works of art. The engraving is plain, bold, and decisive. The color work is elegantly contrasted, but not gaudy.

Perfection and Artistic Elegance

a salient feature of this map not approached by any similar publication.

It has been pronounced a **XXX**
Photograph of the World

One side shows a grand map of our great country, with **counties**, railroads, towns, rivers, etc., correctly located. The other side shows an equally good map of the world. Statistics on the population, cities, capitals, rivers, mountains, products, business, etc., a veritable photograph of the UNITED STATES AND WORLD.

The map is printed on heavy map paper and is mounted on sticks ready to hang. Edges are bound with tape.

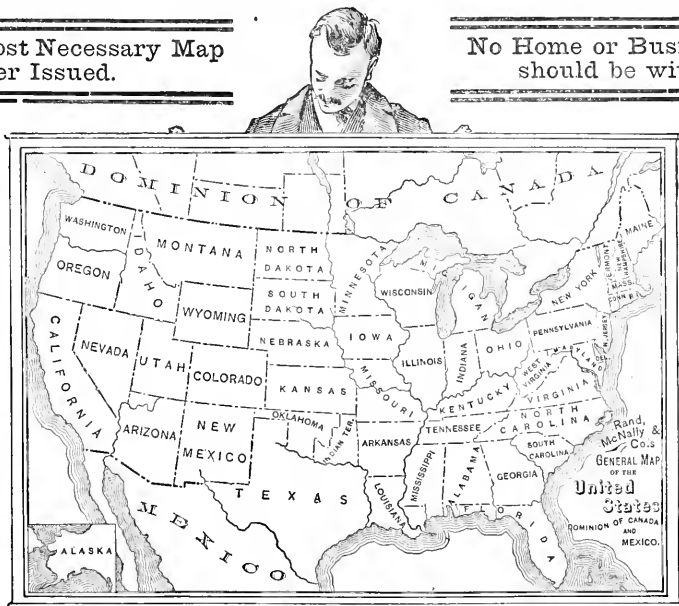

1901 EDITION.—Every reader should consult it every day. The plates show all the new railroad lines and extensions, county changes, etc. Especial attention is given to the topography of the country; all the principal rivers and lakes, mountain ranges and peaks are plainly indicated. The leading cities and towns are shown, special attention being given to those along lines of railroads. The Canadian section of the map gives the provinces of Ontario, Manitoba, and British Columbia, with nearly all of Quebec and New Brunswick, the county divisions being clearly marked. The southern portion of the map includes the Northern States of the Republic of Mexico, and the Bahama Islands.

On the reverse side is the Library Map of the World. The largest and most accurate map on Mercator's Projection ever produced. The political divisions are correctly defined and beautifully outlined in colors. The ocean currents are clearly shown and named. Ocean steamship lines with distances between important ports are given. A marginal index of letters and figures enables one easily to locate every country in the world. A series of short articles in alphabetical order is printed around the border of this map in large, clear type, containing valuable information concerning agricultural, mining, and manufacturing statistics, also the value of imports and exports in dollars. The area, population, form of government, and chief executive of every country in the world is given up to date, also the names of the capitals and their population. **The Inset Maps** are elegantly engraved and printed in colors. They are placed in convenient positions around the United States map, and will be invaluable to every person desiring a plain understanding of our possessions. An inset map of China on the World side of map adds to its value.

Two maps on one sheet, all for only **\$1.50**, sent by mail or prepaid express; or we will forward it free as a premium for sending us **Three New Subscribers** at \$1.00 each; or for \$2.00 we will send the Map and the American Bee Journal for one year. Address,

GEORGE W. YORK & CO.,

144 & 146 Erie Street, CHICAGO, ILL.

A **XXX** Marginal Index

is one of the invaluable features.

It gives an alphabetical list of countries, their location on map, style of government, population, a area, products, minerals, imports, exports, etc.

The 1900 Census **XX**
of the largest American Cities is given.

The Drone's Folks.

"The drone," says a straw in Gleanings in Bee-Culture, "is always a half orphan, for his father is always dead before he is born. He never has a full sister, for the father of his mother's female children is never his father. In fact, he never has any father except his grandfather, and he never lives to see any of his children."

In-Breeding.

The worst dangers of in-breeding are where two beings are mated that are of exactly the same blood, having the same father and mother. Fortunately, the bee-keeper need take no pains to avoid such close breeding; Nature takes care of that. A drone and a queen from the same mother are not full brother and sister, for the father of the queen is not father of the drone. The only way to mate two of exactly the same blood is to mate a drone to his mother, and the drone is born too late for that. —Gleanings in Bee-Culture.

Bees and Pear-Blight.

Regarding the bee and pear-blight question in central California, I am pleased to announce that many of the fruit-growers are coming to (or appear to be coming to) the conviction that the removal of the bees during the time the trees are in bloom will not materially abate the destructive effects of the pear-blight virus. It appears that the resolution passed by the bee-keepers in their convention, to move the bees out of the region of the pear-orchard during the time they were in bloom, required some rattling action on the part of the fruit men in filling out certain blanks. These blanks were laid before them some time ago, but nothing has been done. It is probably true that the pear-orchardists are not very sanguine as to the beneficial effects of the proposed removal, and many of them are fair men, and therefore disinclined to put the bee-keepers to this expense unnecessarily.

I talked with Prof. Waite (who, it will be remembered, originally declared the bees to be guilty), while in Buffalo, regarding this case. He was not sure the removal of the bees would bring about relief, owing to the presence of wild bees and numerous other insects that would, undoubtedly, spread the disease. He was sure, from extended experiments, that the bees were very necessary for the fertilization and proper maturing of the fruit, although he admitted that possibly conditions in California might be different. Prof. Waite is a careful, candid man, and a friend of the bees, and so much so that he deems it necessary to have a few colonies of them in his own pear-orchard, pear-blight or no pear-blight.

Taking everything into consideration, it appears how there will be no conflicting of interests between the bee-keepers and pearmen; and it is hoped that the matter will rectify itself when the pear-blight disease loses its hold or "runs out," as we sincerely hope it may. —Gleanings in Bee-Culture.

"Reviews" from the Bee-Keepers' Review.

BEE-SWAX is the last thing that I should think of using for a lubricant, yet when I took my spectacles to a jeweler because one of the joints turned so hard that it was difficult to move it, he simply rubbed beeswax around the joint and held it over a lamp until it melted and penetrated the joint. Since then it has worked all right. He says that when the hinge to a watch-case works hard he treats it in a similar manner.

EXTRACTING COMBS are better when they are thicker than the ordinary brood-combs. There is less capping for the bees to do, and less uncapping for the bee-keeper besides, it is easier to uncup a thick than a thin comb.

Tickets with longer limit at slightly increased rates. Three through trains daily. Chicago Passenger Station, Van Buren St. and Pacific Avenue. City ticket office, 111 Adams St., Chicago.

30—41A41

With thick combs there are fewer to handle. Most bee-keepers put one less comb in the super than in the brood-nest. With the Heddon hive Mr. J. B. Hall, of Ontario, uses only seven combs in a super, lacking thin strips of wood to the edges of the end bars to make them of such a width that seven will take the place of eight ordinary frames. If the frames are needed for brood-rearing, it is an easy matter to remove the strips of wood.

PACKING put around the bees in winter simply confines and retains the heat that radiates from the cluster. How it does this is well illustrated by the house that Mr. Jacob Alpaugh, bee-keeper like, built for himself, in Ontario. The walls are of matched lumber, packed between with dry sawdust, and lathed and plastered on the inside. The house is only one story high; and the spaces between the joists overhead are packed with dry leaves. For all the world, it is a big chaff hive. Storm windows and doors are used in winter. A little home-made furnace in the cellar warms the whole house, with a fire kept only part of the day—none at night—and sometimes it is necessary to open a door to cool off the rooms.

HAVE FAITH in your business, and stand by it. If you haven't faith in it, and will not stand by it through thick and thin, better get some business in which you have faith. Mr. Jacob Alpaugh of Ontario told me of an experience of his when the season was an entire failure, and colonies not fed died in September. Although already in debt, he went in still deeper by getting several hundred dollars' worth of sugar to carry his bees through the winter. There was a great loss of bees the next winter from lack of stores, but his bees came through in excellent condition. The next year proved to be one of the best. Prices were good, and there were only a few bees in the Province, and his bees not only put him out of debt, but left him with money in his pocket.

A STOUT STRING, or even a piece of wire, attached to the end of a stick, is a most efficient device for starting a screw-cap on a honey-can, or loosening a cover of a fruit-jar. Wind the string around the cover three or four times, draw up the slack so that the string will not slip, and then use the stick as a lever for starting the cover. Simple, isn't it? But had you ever thought of it? I saw this device at the home of R. H. Smith, of Ontario.

EQUALIZING COLONIES and contracting the brood-nests of old colonies just at the opening of the honey harvest is something that is not usually practiced, but A. E. Hoshal, of Ontario, says that with the Heddon hive he finds it an advantage. He looks over both cases of the brood-nest, filling one case with combs that contain the most brood, leaving this case upon the stand. The combs of honey are put away to be given the bees again after the harvest is over. The more populous colonies will contain more than one case of brood, while the weaker colonies will contain less than one case of brood; and, by the time that each colony is given one full case of brood, not much of any brood will be left. This method crowds the bees into the sections and curtails the production of bees at just about the right time.

PENGRETT QUEENS are something that may be found in the apiaries of Mr. Miller, of Ontario. For the last ten years he has kept a record of each colony, the breeding of the queen, the amount of surplus secured, etc. One colony, this year, made a spurt, and furnished ten supers of surplus. He hasn't looked up the breeding of the queen yet, but says he can trace it back ten years.

THE BEST COLONIES devoted to comb honey production, and the others to extracted honey, will allow the bee-keeper to require his yard from his most desirable stock; and the bees worked for comb honey will swarm, and thus furnish the queen-cells for use in making increase. This was suggested by A. E. Hoshal, of Ontario.

CUSHIONS are usually used on top of colonies that are wintered out-of-doors, but M. H. Hunt says that he prefers to lay a large piece

To make cows pay, use Sharps Cream Separators, Book "Business Dairying" & Cat. 212 Cream, W. Chester, Pa.

of cloth in the upper story, over the brood-nest, and pour the chaff into the cloth. He says that he can tuck the packing down more snugly at the corners than with the cushions. In the spring he can grasp the cloth by the corners, lift it out, and dump its contents into a box. The cloths can be packed away in a small space for the summer, and are easily protected from the ravages of mice.

A PORTICO, four or five inches deep, having a wire-cloth front, and large enough to cover the whole front of the hive, is the best thing possible with which to fasten in bees when moving them or shipping them. Nothing worries bees more or for some puts them into a ferment, than to find the entrance closed. While such a portico does not allow the bees to fly, it does not close the entrance, and allows the bees to cluster in it, off the combs. When hives are arranged in this way they can be stacked up without shutting off the ventilation. Jacob Alpaugh, of Ontario, has such porticoes as these for use in moving bees, and one of them can be fastened to the front of the hive in about five seconds by means of a hook made of wire. He had two colonies swarm once when being moved, and the porticoes were filled so full of excited bees that the latter disgorged the honey in their sacs and perished as a result.

DRAWN COMBS in sections can be very profitably secured near the close of the basswood by leaving on one super of partly finished sections, raising it up and putting beneath it a case of sections filled with foundation. By keeping close watch this case can be removed as soon as the combs are partly drawn, and before much honey has been stored in them, or the sections are scarcely soiled with propolis. If the draw continues longer, another case of sections can be put in the place of the one removed, and another set of drawn combs secured. Such supers of half-drawn combs are very valuable for use the next spring.

HIVES IN GROUPS of four is the arrangement in the apiary of J. B. Hall, of Ontario. The groups are named from the letters of the alphabet; thus there is group A, group B, and so on. The two north hives in group A face north, the two south ones face south. In group B the two west ones face west, the two east ones face east. In group C the hives face north and south the same as in group A. By this arrangement no two hives standing near each other have the same relative position, and there is little danger of a returning swarm getting into the wrong hive. When the bees are placed in the cellar in the fall, each hive is marked with a pencil on the front in such a way as to indicate its position; thus: "G-S-W" means that it is the southwest hive in group G. To order that the position of group G may not be forgotten, a big letter G is printed on a piece of section-box, and tacked to a tree just north of the group. Other groups are marked in a similar manner.

Standard Belgian Hare Book!

BY M. D. CAPPS.
THIS book of 175 pages presents a clear and concise treatise of the Belgian Hare industry: its growth, origin and kinds; the sanitation and construction of the rabbitry; selection of breeding stock; care of the young; feeding, diseases and their cures, scoring, marketing, shipping, &c. First edition of 50,000 copies was sold in advance of publication.

Price, in handsome paper cover, 25 cents, post-paid; or with the American Bee Journal one year—both for only \$1.10.

BEST Extracted Honey For Sale

ALL IN 60-POUND TIN CANS.

Alfalfa Honey

This is the famous White Extracted Honey gathered in the great Alfalfa regions of the Central West. It is a splendid honey, and nearly everybody who cares to eat honey at all can't get enough of the Alfalfa extracted.

Basswood Honey

This is the well-known light-colored honey gathered from the rich, nectar-laden basswood blossoms. It has a stronger flavor than Alfalfa, and is preferred by those who like a distinct flavor in their honey.

Prices of Alfalfa or Basswood Honey:

A sample of either, by mail, 10 cents, to pay for package and post-age. By freight—two 60-pound cans of Alfalfa, 8 cents per pound; four or more cans, 7½ cents per pound. Basswood Honey, ½ cent more per pound than Alfalfa prices. Cash must accompany each order. You can order half of each kind of honey, if you so desire. The cans are boxed. This is all

ABSOLUTELY PURE HONEY

The finest of their kinds produced in this country.

Read Dr. Miller's Testimony on Alfalfa Honey:

I've just sampled the honey you sent, and it's prime. Thank you. I feel that I'm something of a heretic, to sell several thousands pounds of honey of my own production and then buy honey of you for my own use. But however loyal one ought to be to the honey of his own region, there's no denying the fact that for use in any kind of hot drink, where one prefers the more wholesome honey to sugar, the very excellent quality of alfalfa honey I have received from you is better suited than the honeys of more marked flavor, according to my taste.

McIlenny Co., Ill.

C. C. MILLER.

Order the Above Honey and then Sell It.

We would suggest that those bee-keepers who did not produce enough honey for their home demand this year, just order some of the above, and sell it. And others, who want to earn some money, can get this honey and work up a demand for it almost anywhere.

GEORGE W. YORK & CO., 144 & 146 Erie St., Chicago, Ill.

The third book is by John Keys, of Bee Hall, near Penbrooke, 1796. Title: "The Ancient Bee-Master's Farewell." It tells about the selection, care, feeding, etc., of bees, describes the observatory hive, artificial swarming, honey-dew, how the queen-cage is made; diseases, thefts, wars, enemies of bees, extracting, etc. The engravings are excellent, showing the movable-frame hive to perfection.

I have the "A B C of Bee-Culture" and "Langstroth on the Honey-Bee." I believe we all are concerned about what we know about the busy little bees. After reading the modern works, and then the ancient, it sort of knocks the props out. We ought to give those old fellows some honor. I feel that we have borrowed it all, or almost all, from them. These books were loaned me by one of our most proficient and oldest bee-keepers, Mr. Charles H. Lake. He has quite a museum of old books, some of the very first experiments in hives in this country. With all the material and facts which Mr. Lake possesses, a most interesting history could be compiled.

CHAS. E. KEMP.

Baltimore Co., Md., Sept. 21.

CONVENTION NOTES.

Chicago.—The executive committee of the Chicago Bee-Keepers' Association has ordered that the next meeting be held all day and evening, Dec. 5, 1901, at the Briggs House club-room. This is arranged on account of the low rates to be charged for the International Live-Stock Exposition in Chicago at that time (Nov. 30 to Dec. 7, being one fare plus \$2.00 for the round-trip). This notice goes by mail to nearly 300 beekeepers near Chicago, and should result in the largest attendance we have ever had. Dr. C. C. Miller and Mr. C. P. Dadant have promised to be present. Let all come.

GEORGE W. YORK, Pres.

HERMAN F. MOORE, Sec.

Colorado.—The Colorado annual meeting promises to be a genuine success. The program has been made out for a number of weeks, and is almost ready for publication. It has come to be a privilege and an honor to read a paper before our Association, and so very few decline who are invited to write or speak for instruction. One paper is already in the hands of the secretaries. On our three nights a big magic lantern will illustrate talks by famous students of bees and the bee-industry. And then we are going to have an exhibition of the choicest hives in the United States made in Colorado (you know), and wax, with bees enough to show "how the thing is done."

If you want to know more, or have forgotten the dates (Nov. 18, 19, 20), write to the undersigned, box 453, Denver, Colo.

The "Successful" Branching Out.—Perhaps one of the strongest arguments in favor of the use of the Incubator, is the immense success and growth of some of the more successful firms. People would not buy Incubators as they have been buying them by the thousand, if they were not as nearly perfect as it is possible to make them. One of the firms who are deservingly getting a large slice of this success is the Des Moines Incubator with their famous "Successful" brand, and Brood Boxes.

This business is growing so rapidly that they have found it necessary to open a branch office at 101 and 105 Erie St., Buffalo, N.Y., to enable them to take care of the large Eastern market that is coming to them. Buffalo is chosen because of its central location, facilities for shipping, and low freight rates, all of which will materially benefit purchasers of Successful machines.

This office is in charge of Mr. Wm. C. Denny, who needs very little introduction to most of our readers. A master mechanic in the hatching and raising of poultry, as well as secretary and treasurer and pioneer organizer of the Buff Rock Club. He is at the same time a broad, "fourteen carat" business man. You eastern fellows will be taken care of in a way that will warm the cockles of your hearts when you visit the Successful plant at Buffalo, and you are invited to make this your headquarters when in Buffalo. If you are not planning to be in Buffalo in the near future, write Mr. Denny a letter. He will gladly supply you information you may want on the artificial hatching and raising of poultry.

Finally, let us say that the Successful machines for 1901-1902, are up to the high standards always set by this house, and are backed up by an unqualified and unequivocal guarantee. Write and let them tell you their story, not forgetting to say that you saw their advertisement in the American Bee Journal.

HONEY AND BEESWAX

MARKET QUOTATIONS.

CHICAGO, Oct. 10.—There is a very good trade in No. 1 comb honey at 15c per pound; that which will not grade No. 1 or fancy sells at from 13c-14c; some small lots of fancy have brought more than 15c; light amber selling at 12c-13c; the dark honeys of various grades range at from 10c-11c. Extracted sells well at 5 1/2c-6c for white, according to quality and flavor; white clover and basswood bringing 7c; light amber, 5 1/2c-6c; dark, 5c-5 1/2c. Beeswax steady at 24c. R. A. BURNETT & Co.

CINCINNATI, Aug. 10.—The honey market is rather dull on account of the warm weather. Extracted sells only to manufacturers from 5c-6c; better grades alfalfa water-white from 6c-7c; white clover from 8c-9c. Fancy white comb honey sells from 13c-15c-16c.

C. H. W. WEBER.

BOSTON, Oct. 12.—Fancy 1-pound honey in cartons, 16c; A No. 1 in glass or cartons, 15c; No. 1, 14 1/2c-15c; very little No. 2 being received. Light amber extracted, 7 1/2c.

BLAKE, SCOTT & LEE.

ALBANY, N. Y., Sept. 19.—We quote: Fancy white comb, 16c; No. 1, 15c; mixed, 13c-14c; No. 1 buckwheat or amber, 12c-13c. Extracted, white, 7c-7 1/2c; light, 6 1/2c-7c; dark, 5 1/2c-6c. Beeswax, 28c-29c. H. R. WRIGHT.

OMAHA, Aug. 8.—New comb honey is arriving by express in small quantities from Iowa and Colorado, and selling at 30c-35c in a retail way. California extracted honey is being offered carlots at 4 1/2c-4 3/4c per pound, f.o.b. California shipping-points, but we have not heard of any sales having been made thus far. The large production of extracted honey seems to be quite large this year in Colorado, Utah and California. PEYCKE BROS.

NEW YORK, Sept. 10.—Comb honey is now beginning to arrive in large quantities, and, as a rule, quality is fine. The demand is good, and we quote as follows: Fancy white, 14c-15c; No. 1, 13c-14c; No. 2, 12c-13c; light amber, 11c-12c. No buckwheat is on the market as yet, but are expecting same within a week or so. Extracted is selling slowly, with plenty of supply, at 5c-5 1/2c, according to quality. No dark honey in barrels at from 5 1/2c-6c per gallon. Beeswax dull at 27c. HILDRETH & SEGELKEN.

DES MOINES, Aug. 7.—There is very little doing here in new crop of honey. Some small lots of near-by produced comb honey are on the market and selling in a retail way at \$3.50 to \$3.75 per case. We do not look for much trade in this line before Sept. 1. Our market does not consume a great deal of extracted honey. PEYCKE BROS. & CHANEY.

DETROIT, Aug. 12.—Fancy white comb honey, 14c-15c; No. 1, 13c-14c; no dark to quote. Extracted, white, 6c-7c. Beeswax, 25c-26c. M. H. HUNT & SON.

SAN FRANCISCO, Sept. 4.—White comb, 10c-12c; amber, 7c-9c; dark, 6c-7c cents. Extracted, white, 5c-6c; light amber, 4 1/2c-5c; amber, 4c-5c. Beeswax, 26c-28c.

Arrivals and spot offerings are of rather moderate volume, but there is as much or more on market than can be conveniently sold at a generously placed. To secure liberal wholesale custom, prices would have to be shaded in favor of buyers. In a small way for especially desirable lots slightly higher figures than are quoted are realized.

KANSAS CITY, Sept. 14.—Up to the present time only small lots of new comb honey have been on the market, and these met with ready sale on the basis of 15c-16c per pound for fancy white. For next week heavier receipts are expected and quoted at \$3.00-3.25 per case for large lots, which would be equal to about 14c-14 1/2c; the demand being quite brisk, a firm market is anticipated. Inquiries for extracted are a little more numerous, but buyers still seem to have their ideas too low. In a small way 5 1/2c-6c is quotable.

A New Bee-Keeper's Song—

**"Buckwheat Cakes
and Honey"**

Words by EUGENE SECOR.

Music by GEORGE W. YORK.

This song was written specially for the Buffalo convention, and was sung there. It is written for organ or piano, as have been all the songs written for bee-keepers. Every home should have a copy of it, as well as a copy of

**"THE HUM OF THE BEES
in the APPLE-TREE BLOOM"**

Written by

EUGENE SECOR and DR. C. C. MILLER.

PRICES—Either song will be mailed for 10 cents (stamps or silver), or both for only 15 cents. Or, for \$1.00 *strictly in advance* payment of a year's subscription to the American Bee Journal, we will mail both of these songs free, if asked for.

RED CLOVER QUEENS

BLACK ROCK, N. Y., Sept. 3, 1901.

FRIEND ERNEST:—I will try and tell you what you want to know about that queen. I got her of you in 1899 as a premium with GLEANINGS. I never saw a small colony of bees build up as that one did. In the spring of 1900 they came out in fine shape, wintered perfect. I raised them up in May and gave them 8 frames more so the queen would not want for room. I never saw such a colony of bees as they were in June, and they were actually storing honey when other bees in my yard were starving. No! they were not robbing. I never saw those two best colonies of mine trying to rob. THEY CERTAINLY WORK ON RED CLOVER. This is no guesswork, as I have seen them. As you know, the past two seasons have been very poor, and what honey my bees did get in 1900 candied soon after cold weather set in. I packed this colony in a chaff hive and left them out, thinking that such a strong colony would winter perfect. The snow came on the middle of November, and those poor bees never a fly until the last of March or the first of April. When warm weather at last came I thought they were dead, as they did not seem to be flying much, so I did not pay any attention to them until in June. I noticed they were working a little, so I opened up the hive and found them in the upper story. I took the lower story out and left them in the one body. The queen was laying nicely, and I thought they would make a good colony to winter. Along the last of July I noticed that they needed more room. I gave them super, 24 boxes, and in a few days they had it full. They have made 72 boxes of as nice honey as you ever saw, and are drawing out some starters now, Sept. 2.

Very truly yours,

GEO. B. HOWE.

If more convenient, Dues may be sent to the office of the American Bee Journal, when they will be forwarded to Mr. Secor, who will mail individual receipts.

A Celluloid Queen-Button is a very pretty thing for a bee-keeper or honey-seller to wear on his coat-lapel. It often serves to introduce the subject of honey, and frequently leads to a sale.

NOTE.—One reader writes: "I have every reason to believe that it would be a very good idea for every bee-keeper to wear one of the buttons as it will cause people to ask questions about the busy bee, and many a conversation thus started would wind up with the sale of more or less honey; at any rate it would give the bee-keeper a superior opportunity to enlighten many a person in regard to honey and bees."

The picture shown herewith is a reproduction of a motto queen-button that we are furnishing to bee-keepers. It has a pin on the underside to fasten it.

Price, by mail, 6 cents; two for 10 cents; or 6 for 25 cents. Send all orders to the office of the American Bee Journal.

Langstroth on... The Honey-Bee

Revised by Dadant—1900 Edition.

This is one of the standard books on bee-culture, and ought to be in the library of every bee-keeper. It is bound substantially in cloth, and contains over 500 pages, being revised by those large, practical bee-keepers, so well-known to all the readers of the American Bee Journal—Chas. Dadant & Son. Each subject is clearly and thoroughly explained, so that by following the instructions of this book one cannot fail to be wonderfully helped on the way to success with bees.

The book we mail for \$1.25, or club it with the American Bee Journal for one year—both for \$1.75; or, we will mail it as a premium for sending us **THREE NEW SUBSCRIBERS** to the Bee Journal for one year, with \$3.00.

This is a splendid chance to get a grand bee-book for a very little money or work.

GEORGE W. YORK & CO.

144 & 146 Erie Street, CHICAGO, ILL.

—THE— The Bee-Keeper's Guide; Or, Manual of the Apiary, —BY— PROF. A. J. COOK.

460 Pages—16th (1899) Edition—18th Thousand—\$1.25 postpaid.

A description of the book here is quite unnecessary—it is simply the most complete scientific and practical bee-book published to-day. Fully illustrated, and all written in the most fascinating style. The author is also too well-known to the whole bee-world to require any introduction. No bee-keeper is fully equipped, or his library complete, without **THE BEE-KEEPER'S GUIDE**.

This 16th and latest edition of Prof. Cook's magnificent book of 460 pages, in neat and substantial cloth binding, we propose to GIVE AWAY to our present subscribers, for the work of getting NEW SUBSCRIBERS to the American Bee Journal.

Given for TWO New Subscribers.

The following offer is made to PRESENT subscribers only, and no premium is also given to the two NEW SUBSCRIBERS—simply the Bee Journal for one year:

Send us **TWO NEW SUBSCRIBERS** to the Bee Journal (with \$2.00), and we will mail you a copy of Prof. Cook's book FREE as a premium. Prof. Cook's book alone sent for \$1.25, or we club it with the Bee Journal for a year—both for only \$1.75. But surely anybody can get only **TWO NEW SUBSCRIBERS** to the Bee Journal for a year, and thus get the book as a premium. Let every body try for it. **WILL YOU have one?**

GEORGE W. YORK & CO.,

144 & 146 Erie Street, CHICAGO, ILL.

The Novelty Pocket-Knife.

Your Name and Address on one side—Three Bees on the other side.

(THIS CUT IS THE FULL SIZE OF THE KNIFE.)

Your Name on the Knife—When ordering, be sure to say just what name and address you wish put on the Knife.

The Novelty Knife is indeed a novelty. The novelty lies in the handle. It is made beautifully of indestructible celluloid, which is as transparent as glass. Underneath the celluloid, on one side of the handle is placed the name and residence of the subscriber, and on the other side pictures of a Queen, Drone, and Worker, as shown here.

The Material entering into this celebrated knife is of the very best quality; the blades are hand-forged out of the very finest English razor-steel, and we warrant every blade. The bolsters are made of German silver, and will never rust or corrode. The rivets are hardened German silver wire; the linings are plate brass; the back springs of Sheffield spring-steel, and the finish of the handle as described above. It will last a long time, with proper usage.

Why Own the Novelty Knife? In case a good knife is lost, the chances are the owner will never recover it; but if the "Novelty" is lost, having name and address of owner, the finder will return it; otherwise to try to destroy the name and address, would destroy the knife. If traveling, and you meet with a serious accident, and are so fortunate as to have one of the "Novelties," your POCKET KNIFE will serve as an identifier; and in case of death, your relatives will at once be notified of the accident.

How appropriate this knife is for a present! What more lasting memento could a mother give to a son, a wife to a husband, a sister to a brother, or a lady to a gentleman, the knife having the name of the recipient on one side?

The accompanying cut gives a faint idea, but cannot fully convey an exact representation of this beautiful knife, as the "Novelty" must be seen to be appreciated.

How to Get this Valuable Knife.—We send it postpaid for \$1.25, or give it as a Premium to the one sending us **THREE NEW SUBSCRIBERS** to the Bee Journal (with \$3.00). We will club the Novelty Knife and the Bee Journal for one year, both for \$1.90.

GEORGE W. YORK & CO.

St., Chicago, Ill.

*Please allow about two weeks for your knife to be mailed.

ESTABLISHED IN 1861 AMERICAN THE OLDEST BEE-PAPER IN AMERICA BEE JOURNAL

41st YEAR.

CHICAGO, ILL., OCTOBER 24, 1901.

No. 43.

* Editorial. *

"Too Previus" Unqueening.—Quite a number of beginners in bee-keeping make a big mistake when, after they have ordered queens from a dealer or breeder, they immediately kill the queens of the colonies where they wish to introduce the new queens when they arrive. This is a risky and unnecessary thing to do. Never destroy a reigning queen until the queen sent for is received. Very often queens can not be sent by return mail, even if so advertised. A breeder may be able to send by return mail almost invariably, but more than likely the bee-keeper who has been so hasty as to kill the old queen before the new one arrives is so unfortunate as to have the mailing of his queen unavoidably delayed several days or a week. Even a queen-breeder can not control all circumstances at all times. So the safest way is to wait until the new queen is on hand, then proceed to remove the old queen and introduce the new one according to directions.

Discrepancies of Apianar Writers.—There is not entire unanimity among the writers of bee-literature. Views are held that seem diametrically opposed. Sometimes they are really just as much opposed as they seem to be. Sometimes wrong views are held. Sometimes a difference of locality or a difference in conditions may give rise to opposite views, both views being right. Sometimes, however, a fuller understanding may show that there is really no discrepancy where discrepancy appeared.

A case in point is that of getting unfinished sections cleaned out by the bees. The Miller plan is to have the sections in a pile with an entrance so small that only one or two bees can pass at a time. The B. Taylor plan is to spread out the sections so as to allow the freest approach. One plan seems to be the exact opposite of the other, yet a little explanation will show that both plans have the same basis for action.

In a time of scarcity expose a single section of honey, and in a little while it will be so thickly covered with bees that no part of the comb can be seen, and the comb will be chewed up into little bits. If by any means it can be so managed that the bees shall not beat all crowded upon the comb, the bees will deliberately empty the honey without marring the comb.

The Miller plan says: Admit so few bees at a time that they will not be crowded upon

the comb. The Taylor plan says: Spread out so many sections that there will be no crowding. Each plan strives for the same thing—to prevent the bees crowding upon the comb. The Miller plan is safe in any case; the Taylor plan works more rapidly, but can be used only when 8 or 10 sections can be put out for each colony.

The Illinois Fair Premiums were awarded by C. P. Dadant this year. Secretary James A. Stone, of the State Bee-Keepers' Association, has sent us the list, which is as follows:

Display of comb honey—1st, J. A. Stone & Son, \$20; 2d, Chas. Becker, \$15; 3d, G. M. Rumlér, \$10.

Collection labeled cases containing 12 or more pounds of white honey from different flowers—1st, Chas. Becker, \$8; J. A. Stone & Son, \$5; G. M. Rumlér, \$3.

Collection labeled cases containing 12 or more pounds of amber or dark honey from different flowers—1st, Chas. Becker, \$8; 2d, G. M. Rumlér, \$5.

Case white clover comb honey, 12 to 24 pounds—1st, Aaron Coppin, \$4; 2d, Geo. A. Hunt, \$3; 3d, J. A. Stone & Son, \$2.

Case of sweet clover comb honey, 12 to 24 pounds—1st, Chas. Becker, \$4; 2d, J. A. Stone & Son, \$3; 3d, Aaron Coppin, \$2.

Case of basswood comb honey, 12 to 24 pounds—1st, Chas. Becker, \$4; 2d, J. A. Stone & Son, \$3; 3d, G. M. Rumlér, \$2.

Display of extracted honey—1st, Chas. Becker, \$20; 2d, J. A. Stone & Son, \$15; 3d, G. M. Rumlér, \$10.

Honey extracting on the grounds—1st, C. Becker, \$5; 2d, J. A. Stone & Son, \$3.

Frame of comb honey for extracting—1st, G. M. Rumlér, \$5; 2d, Chas. Becker, \$3; 3d, J. A. Stone & Son, \$2.

Display of candied honey—1st, C. Becker, \$20; 2d, J. A. Stone & Son, \$15; 3d, G. M. Rumlér, \$10.

Display of beeswax—1st, J. A. Stone & Son, \$15; 2d, Chas. Becker, \$10; 3d, G. M. Rumlér, \$5.

One-frame observatory hive of dark Italian bees—1st, G. M. Rumlér, \$4; 2d, C. Becker, \$3.

One-frame observatory hive of golden Italian bees—1st, Chas. Becker, \$4; 2d, G. M. Rumlér, \$3.

One-frame observatory hive of Carniolan bees—1st, J. A. Stone & Son, \$4; 2d, Chas. Becker, \$3.

Honey-vinegar, one-half gallon, with recipe for making—1st, G. M. Rumlér, \$4; 2d, J. A. Stone & Son, \$3; 3d, Chas. Becker, \$2.

Display of designs in honey or beeswax—1st, J. A. Stone & Son, \$12; 2d, Chas. Becker, \$8; 3d, G. M. Rumlér, \$5.

The Colorado Convention.—The 22d annual session of the Colorado State Bee-Keepers' Association will be held in Representatives Hall, State Capitol, Denver, Nov. 18, 19 and 20. The following program has been prepared by the program committee. The secretary, D. W. Working, says it is probable that there will be a few minor changes in the program, but nearly all the

papers have been definitely promised, and that a profitable and interesting meeting is assured.

In addition to the usual officers' reports, discussions of questions, etc., the following papers, addresses, etc., will be given:

Grading Honey—J. S. Bruce.
Summary of the Recent Discussions on Breeding—F. L. Thompson.

President's Address—R. C. Aikin.
Stereopticon Talk, Illustrating Bee-keeping in the United States and Canada—E. R. Root.

The Interests of Isolated Bee-Keepers—Frank Drexel.

Advice to Beginners—H. C. Morehouse.
Methods of Wintering Bees—L. F. Jouno.
A Good Honey-House—T. Lytle.

Abnormal Swarming-Fever—Mrs. A. J. Barber.

Stereopticon Lecture—The Anatomy of the Honey-Bee—Prof. C. P. Gillette.

Long-Tongued Honey-Bees—Prof. Gillette.
When to Produce Extracted Honey—A. F. Foster.

Extension of State Association Benefits—D. W. Working.

The National Bee-Keepers' Association—R. C. Aikin.

An attractive feature will be the exhibit of bees and bee-products. The premium list (a copy of which we have not seen) should attract a large and representative showing of the work of our little storers of sweets.

It is earnestly hoped that there may be a large attendance. The Colorado Association is practically the only rival of the National, both in membership and value to the bee-keeping industry of the United States. Some day we trust there may be others to claim such a distinction.

How Long are Brood-Combs Good?

—To this question a bee-keeper replies in Centralblatt, that at the most they should not be used more than three or four years, one reason therefor being that the queen shows her preference for new combs in which the bees are better developed. It would be very hard to convince the mass of bee-keepers that just as well developed bees do not proceed from combs 20 years old. And that queens prefer to lay in fresh combs is decidedly against the observations of many bee-keepers on this side.

Correct Use of Bee-Keeping Terms

is a matter of some consequence. It has been a matter of no little difficulty to have the use of "hive" for "colony" eliminated from our bee-literature. "Swarm" for "colony" was a quite common. Now that the tendency toward correctness in terms has become somewhat general, there seems to be a letting-up under the plea that several names for the same thing gives a pleasing variety. This is

much to be regretted. Variety secured at the expense of perspicuity can hardly be pleasing.

A reputable journal has so many times used the word "stand" when "colony" was meant that it can hardly be otherwise understood than that such use is approved. The word "stand" having a specific use in bee-keeping as designating the thing upon which a hive stands, its use in another sense serves just as much for confusion as for variety. Is there any argument for the use of "stand" when "colony" is meant, that will not equally support the use of "hive" in the same way? A single word for each idea, and a single idea for each word, gives a clearness of understanding for which no amount of variety will compensate. Two words for the same idea and two ideas for the same word are common enough, let us not add to the confusion.

Weekly Budget.

MR. WALTER R. ANSELL, of Ramsey Co., Minn., sent us the photograph from which was taken our front-page engraving this week. He had this to say about it:

"I enclose a photograph of a honey-comb I caused my bees to produce for the Minnesota State Fair exhibit. It took first premium for novel design. My little boy was placed by its side in order to show its relative size. The weight is about 40 pounds. With the aid of a glass my descriptive card can be easily read on the photograph."

The card attached contains the following information:

"CIRCUMAPOLIS."

"These concentric cylinders of honey-comb all rest on the same base, the inner one being 9 inches deep. When made by the bees, they occupied an inverted position, the present base then forming the cover of the hive."

MR. W. W. LATHROP, of Fairfield Co., Conn., writing us recently had this to say about "The Home Circle" department in this journal:

EDITOR YORK: Ever since Prof. Cook began his home circle papers I have intended to write and tell you how well I like them. If there was nothing else in the American Bee Journal I would still keep on taking it. They alone are worth a dollar a year to me. I hope some time they will be published in book form, for I should like to have such a book in my library.

I have had so much to say to my wife about Prof. Cook, and have read to her from his home papers at different times, until now, whenever I am cross and say or do something that I ought not to, she says, "Is that the Prof. Cook would do?" or "Come now, Prof. Cook, you have forgotten yourself." Of course, this stops further trouble. So you see, Mr. York, the home circle papers do good in one home, at least.

THE NOVEMBER DELINEATOR—A seasonal atmosphere rises from the various useful and valuable features of the November Delineator. The styles shown are those for early winter; the dress-making article tells about the making of coats; the fancy needlework article bears upon Thanksgiving and Christmas gifts; the crocheting articles are those of a winter character; the gardening article deals with the pruning and protection of rose-trees throughout winter. Every woman who wishes to get splendid value for her expenditure should buy the Delineator for itself. It in turn will help her to economize in household matters at every point. The Buffalo Convention.

Report of the Proceeding of the Thirty-Second Annual Convention of the National Bee-Keepers' Association, held at Buffalo, New York, Sept. 10, 11 and 12, 1901.

The 32d annual convention of the National Bee-Keepers' Association was called to order at 7:30 p.m., Sept. 10, by Pres. E. R. Root, of Ohio, who called on Rev. E. T. Abbott, of Missouri, to offer prayer. Mayor Diehl, of Buffalo, was then introduced to the convention and delivered the following

Address of Welcome.

I don't know as the Mayor can entertain you very long, but I wish to extend to you a most hearty welcome to our city, and I am sure that your deliberations will be of benefit to your-

PRES. E. R. ROOT.

selves, and not alone to yourselves, but to others. A small incident comes to my mind, which is no doubt very familiar to you, but to me, as a city man, it was very strange when I first saw it. Some twelve or thirteen years ago I happened to be in a small Alsatian village, and all of a sudden there was great consternation, and the word came that the bees were swarming. I had nothing else to do except to be—as any boy might be—ready to see anything that came along, and it amused me to see the farmers in this small village flock to where the swarm was alighting on a tree, and, with mittens on, gather the bees into baskets and carry them off with satisfaction. I inquired about it and told him I was from America, and he said, "I would like to show you something that your country is responsible for, and which

has been of great benefit to the people of Alsace." And he took me into an addition to his barn and showed me a large tin tub and showed me how the Americans had taught them to get the honey out of the combs by the centrifugal method, and it, of course, pleased me as an American citizen very much, and shows me that your meeting to-night must be of benefit to you and of benefit to everybody.

I hope that, in the interval between your deliberations, you may have an opportunity to see our beautiful Exposition, which will certainly show a large number of exhibits that will be of interest to you; and not alone the exhibits but the beauty, the advancement, so to say, of civilization, in our color schemes and everything that pertains to that; and, aside from that, I hope you will also, as time permits, see not alone the Exposition, but our beautiful city. I think we have the most beautiful city in the world; we certainly have as nice homes, more asphalt streets and the finest breakwater in the world; and our commerce will certainly be enhanced by all the advantages we now have, and which our good Government has done for the city of Buffalo by placing that very extensive breakwater before our city gates.

In closing, I wish to inform you that, having just heard from the President's bedside, I think I can safely tell you that the danger line has passed, and the President will get well. And now, extending to you all the courtesies of our city, and the freedom, I hope you will accept the same, so that when you return to your homes you may have a pleasant remembrance of our city.

Rev. E. T. Abbott, of Missouri, responded as follows to the Mayor's address:

Response to the Mayor's Address.

It is surely a source of exceedingly great pleasure to me to respond to such an address of welcome, on account of its significance. Bee-keeping has not always received the recognition that it should at the hands of Government, at the hands of the cities where we have held our meetings. I have thought sometimes that the citizens of the large cities were too indifferent to what I believe to be the most excellent work which we are doing, and when it was said that the mayor of a great city, like the city of Buffalo, was expected to stop his many duties and appear among the bee-keepers to welcome them to the city, I said there must be some mistake about it. I don't know that we have ever gotten such a recognition from any city government of this size

during all of my experience in attending the meetings of the National Bee-Keepers' Association, and I have attended all of them for a number of years, and I said this means well; but a remark by the Mayor has explained the whole matter to me. I understand why it is. The Mayor is of German descent, and the Germans are the best bee-keepers there are in America, and, notwithstanding the fact that America is in advance of Germany in bee-keeping, yet there is more enthusiasm in Germany with regard to the industry than in America, and there are more Germans who have a clear and intelligent conception of farm bee-keeping than any other class of people; there are more Germans who are making it profitable in connection with other agriculture—for I look upon it as a branch of agriculture.

And now I am glad that the people of Buffalo have had the good sense to elect to this high office the gentleman who was so closely in touch with Mother Earth—so closely in touch with the soil, from which all the wealth of the land, and out of which all the glory and beauty of this great city have been built. I say I am glad to know that the people of Buffalo have had the good sense to do a thing of that kind. It speaks well for the future of the country, for what is needed is to bring the country and the city in close touch which each other, to get the farmer to understand that he is not a "hayseed," to get the citizen of the great city to understand that all the brain doesn't walk abroad on asphalt pavements; to get these facts, these two facts, clearly before the American people will be worth a great deal; when commerce and trade and traffic join hands with the man who holds the handles of the plow, when rural pursuits and city commerce move hand in hand and co-operate with each other, then we will have reached what I believe to be the ideal nation.

I am not surprised, of course, that the Mayor welcomes us to the city. We are a great people and deserve to be welcomed! We may be farmers and ordinary professionals, a great many of us, but we are the sweetest people on top of God's earth. There isn't any sweeter people that walk the earth, men and women both, than the bee-keepers; they deal in the sweetest, purest, healthiest, noblest sweet that the world has ever known. It is distilled by the chemistry created by the Almighty alone; it is drawn out of the vital energies of the universe; it is made in a retort created by the hands of the Almighty and gathered by insects that has inhabited the world away back into geological ages, and stored away by them in a way that baffles the skill of man and defies the most expert scientific man to imitate. It is true we are told that they manufacture comb honey out of chips and fill it with glucose and sell it to the ignorant people of the city for the pure article, but we bee-people know that it is a newspaper canard. They do not do that. There isn't any manufactured comb honey. I hope that will get in print to-morrow in big letters. But I tell you what they do: The unscrupulous city man takes a little bit of real good honey and puts a great deal of real dirty, stinking mean glucose into it, and puts it into

a nice-looking bottle and labels it with a nicer-looking label, "Pure Clover Honey," and sells it to the people who are green enough to buy it, and this has greatly injured our industry.

Now, to get back to my original proposition, that I was glad the city government was taking notice of us. Here is where the city government can greatly aid us, here is where the national government can aid us, when they come to our rescue and make it impossible for a man to sell anything for what it is not. Here is a work that the government of the city of Buffalo can take in hand and make it a criminal offense to sell a man a spoonful of honey and four spoonfuls of glucose all for honey. Anybody who wants four spoonfuls of glucose mixed with a spoonful of honey has a right to buy it, but call it what it is, a mixture, and let people use it as a mixture, but the bee-keepers protest against having it sold for honey, for it is not honey; it is a fraud, that is what we call it out West.

Now, friends, I think I have said enough and have taken enough of your

EMERSON T. ABBOTT.

time. I think we all appreciate the words of welcome that have been extended to us, and I want to say to you, Mr. Mayor, that we will avail ourselves of them, we shall walk on your streets, we shall go out and see the great Pan American, and, of course, this has been the greatest exposition of the kind that has ever been held, except one we shall hold in St. Louis, in 1903, the Louisiana Purchase Exposition. We wish Buffalo Godspeed, and all success, but we now, in behalf of the great, large-hearted people of the great State of Missouri, invite you to come and receive our welcome in that State of Jesse James, if you please, but of intelligence, progress and virtue, in 1903. We will have an exposition that will astonish not only the United States, but the world, for they are coming from all over the world, just as you have them here. I thought Buffalo could never have an exposition like Chicago, but I want to say to Mr. York, who lives in Chicago, that when

he gets out to the Pan-American he will see that the last is the best; and it looks now as if we were going to get just as many bee-keepers together here, and if we don't get so many in number we will make up in enthusiasm for what we lack in numbers, and we will have the best North American meeting we have ever had in the history of this society. I thank you for your attention.

Dr. A. B. Mason, of Ohio—I notice here several Ontario Bee-Keepers' Association badges, and I am so well pleased with it that I am going to move you that we give to all the members of the Ontario Bee-Keepers' Association that are present with those badges on, the privileges of this floor, and to participate in all our discussions and answer questions, and to feel perfectly free and at home. I move you that we extend that privilege to them.

The motion was seconded by Mr. Abbott and carried.

Mr. John Newton, of Ontario, president of the Ontario Bee-Keepers' Association—in behalf of our Association I would thank you for your kindness to us, and this invitation to take in the discussions the same as your own members. I am sure that we will be pleased to do so, and I know that we will feel at home, just as we tried to make your society at home when we had you in our midst.

Pres. Root—We have no set program. We are trying the experiment of having just a question-box, and it possibly may be a failure, but we have some men here who, we know, if they have a mind to, can make it a grand success. A good supply of questions has been handed to the secretary, Dr. Mason, and as we have no committee on question-box, he will read the first one.

Dr. C. C. Miller, of Illinois—I think it would be well to mention in connection with this matter that any member is entirely at liberty to hand in any question that he wants discussed.

AN APIARY OF CROSS BEES.

Dr. Mason then read the first question, "What is to be done with an apiary of cross bees?"

Dr. Miller—I overheard a lady right here saying, "Kill them." If I had an entire apiary of cross bees I should want, first, to introduce some new blood of a kind that would be more gentle. This, however, is what will come in the experience of any bee-keeper who has any number of colonies; he will find after a time that he will go out some day and there will be a lot of cross bees after him, and if he takes pains enough to watch closely he will find that all those cross bees come from one or two colonies, and then all he needs to do is to kill one queen and introduce another queen; and a curious thing about that is, that a change in the disposition of the bees has seemed to be much more rapid than the change in the blood of the bees; that is, if I find one such cross colony and kill the queen and introduce another, within two weeks' time, although there would be no change yet in the bees, that is, the same bees would be there, there would be a very decided change in their deportment, and although it seems rather unreasonable to suppose such a thing to be

the case, it looks to me as if the simple presence of the queen had something to do with the disposition of the bees.

Pres. Root—Sometimes the cause suggests the remedy. Sometimes bees are very cross in an apiary under certain kinds of management. Speaking about cross bees, it seemed to me that the crossbees I ever saw were the bees in southern California. It seemed to me that they were trained to be cross; I could not get anywhere near the apiaries without protection, and sometimes if I was half a mile away they would come out to meet me. I fell to wondering why they were so cross. The great majority of beekeepers there produce extracted honey. Their hives are any old box, and they leave one or two inches of space between the extracting and the brood frames. When they separate the upper story from the lower one and get ready to extract they break all this comb, and it irritates the bees. The bees are what we would call a very good grade of hybrids, and they are not naturally very cross bees, but tearing the combs to pieces is apt to irritate them more or less.

N. A. Kluck, of Illinois—I have had a little experience with cross bees. In working around them, should they get cross, thoroughly smoke them and then kick the hives. I whip my bees when they are cross, and smoke them till they don't know anything.

W. L. Cogshall, of New York—I would not give them that treatment. I may kick the hives, but the bees are subdued before I kick the hive. I had a boy take off 80 top stories last Tuesday, and after the bees were subdued—you may have a wrong impression about the kicking—when the bees are subdued, they are just as peaceable as can be, and kicking them doesn't affect them; to kick off the top story wouldn't hurt anything.

Pres. Root—I have noticed that in cutting down a bee-tree, as soon as the tree falls the bees are apt to be very cross, but when one takes an axe and begins to chop away at the tree the bees seem to be demoralized. Severe smoking is liable to induce robbing.

SPRING DWINDLING AND THE REMEDY.

"Is spring dwindling a disease? If so, what is the remedy?"

Dr. Miller—How many think it is a disease?

Mr. Kluck—Old bees, is it not?

Mr. Abbott—What do you mean by disease?

W. Z. Hutchinson, of Michigan—My idea of spring dwindling is imperfect wintering. They need to have good food. Good food is the pivot of successful wintering. If you have good food and protect the bees you will not have spring dwindling. I think spring dwindling is the result of poor wintering. I would not call it a disease, unless an overloading of the system from confinement constitutes a disease.

Mr. Abbott—Doesn't a cold spring have something to do with it?

Mr. Hutchinson—I think it would have something to do with it.

Mr. Abbott—I would like to suggest that spring dwindling is frequently the result of foolish feeding. I have known a great many people to kill off their bees with feeding. Take the average farm bee-keeper and he is just as likely to cause spring dwindling by

feeding his bees as to do them any good, if he feeds them late in the fall. A great many bees are provoked to fly out in the spring by foolish feeding, when, if they were left alone, and not fed at all, would not break the cluster, and the result is they wear themselves out before it is time for the queen to lay any eggs. Some people wonder why it is, and say they followed the bee-books, but the man who isn't intending to use brains in connection with bee-books would be better off without them, especially when it comes to feeding. Farmers come to me and say, "I thought my bees were a little short, and I fixed them up some syrup and put it under the hive, and I have been feeding them for a long time," when the mercury was standing down below freezing all the time, and a man who feeds bees when the mercury is in that condition is simply producing spring dwindling; and if you should define disease as an abnormal condition, I should say it was a disease.

Pres. Root—As I understand Mr. Abbott, feeding in the spring has a tendency to cause the bees to fly out, and they become chilled and do not get back.

Mr. Abbott—Not only that, but the over-activity of the bee exhausts its vitality.

Mr. Hutchinson—I thought it was the result of imperfect wintering.

Mr. Abbott—I don't believe it.

Mr. Hutchinson—Mr. McEvoy, in Canada, has very good success in wintering his bees, and he crowds them down on five or six combs of solid honey, and does that so that they can not breed towards spring, and if those combs are not full of honey he feeds them till they are full, and will not take any more food. He feeds that in the fall.

Dr. Miller—I confess, to begin with, that I do not know what is the cause of spring dwindling. It is a matter of exceeding consequence sometimes to all of us, and I would like very much if we could get at what is the cause of it. In the first place, I think we all would be very likely to agree that it is not a disease. It is a condition. Not such a condition as would be called a disease, however, and the facts that have been started are all in the line with the observation of any one who takes pains to make any observation about it at all. It would be worth something to us if we could get down to find out what is the condition that is produced. Now, it may be true, for instance, that food of a certain kind brings about that condition, but what is that condition? Will feeding and making them fly out at inopportune times make spring dwindling? and is that all there is of spring dwindling? Is it simply the fact that a number of bees have flown out and become lost? That is not spring dwindling according to my observation. It is something more than that. I don't know that I know what that condition is, but I will say this much about it, that when you find spring dwindling I think you will almost always find that the number of bees present in the hive compared with the amount of brood is always small. Now, I would like to know, as a matter of fact, whether the observation of my friends here agrees with that. Is that the common thing? It has appeared to me to be the case that, whenever I

had a case of spring dwindling, there were too few bees in the hive to take care of the brood that was there. Now, if that is a common thing, I would like to know it.

H. L. Case, of New York—A few years ago, in the latter part of April and forepart of May, I lost 80 colonies of bees by what I called spring dwindling. The fall before my bees gathered a large quantity of honey-dew, and the winter was a severe one; it kept them in the hives perhaps four months without giving them a flight. Now, I believe the reason I had spring dwindling that winter, or that spring, was on account of improper food, and the conditions were improper for their prosperity; if they had had one or two good flights in the autumn, so that they could fly right out on a warm day, and have a good flight, I think it would have been better. I saved only 20 small colonies, and after the first good day that we had when the bees could fly out I didn't lose any more bees to speak of. Now, I agree with Mr. Hutchinson, that improper feeding and the conditions through winter, confining them to their hive and they consuming too much food, made them lazy, and they could not get out to relieve themselves, and the result was that I lost the 80 colonies.

Pres. Root—It is very evident that there are a good many causes that induce spring dwindling.

Mr. Kluck—Would the gentleman state the time when the bees gathered that honey-dew?

Mr. Case—It was the forepart of September. I went bee-hunting at the time. I spend some time in the fall hunting wild bees, and there was so much honey-dew on the forest leaves in my section that they would not pay any attention to honey. I could not get a bee to return to the box, and you could go into the forest and it would seem as if there was a swarm of bees, and they filled the hives full, from 25 to 30 pounds of that honey-dew in the course of, as I remember, five or six days, and they sealed it nicely, but I couldn't do much, and let it go, with the results that I have stated.

Pres. Root—How many have had experience with spring dwindling?

Dr. Miller—Now I wish, Mr. President, you would ask how many have had cases of spring dwindling in which little or no brood was present in the hive.

Pres. Root—If I understand the Doctor, he finds a condition which we sometimes find in our apiary along in March, when the bees evidently see that their numbers are small, and that they must have some brood to keep up the animal heat, and the queen lays a little more than they can take care of, and they spread out too much and die on the outside edges. I have seen the bees so spread out on the batch of brood that they would all die.

Dr. Miller—Further than that, I have had a number of cases where there were too few bees, and they have tried to cover the brood, and have apparently had a consultation and decided it was too much for them, and then all swarmed out.

J. S. Callbreath, of New York—I had a colony very strong with bees. I sent for a good queen and introduced her the next spring. I happened to be there so that I could watch, and I

looked on occasionally. I noticed, with that colony, that had so many old bees in the field, it began rearing brood much earlier than any of the others, and in a little while they were dead. It was a condition of exhausted vitality, as you have just said. They get in a hurry about rearing brood to see if they could not possibly save the colony.

Pres. Root—The remedy, it would seem, would be implied from the discussion. It would be protection, proper feeding, food given at the right time; and those are conditions that we can very well meet.

Dr. Miller—If there is anything like correctness in my diagnosis, then one thing in the remedy would be to have a large quantity of young bees in the fall, and anything that would tend to that—but I confess that I do not know whether my diagnosis is right.

Pres. Root—Proper feeding, proper protection, food properly given—and when I say protection I mean in double-walled hives or indoors, a proper indoor repository with sufficient ventilation. All these things may help to offset unusual conditions that we can not control in the way of weather, and the cause suggests the remedy.

J. S. Barb, of Ohio—I had experience in spring dwindling, and I find that double-walled hives are not very much better than single ones. As a general thing you will have a lot of old bees to start with in the fall, and that condition prevents them from rearing brood in the spring.

Pres. Root—I have noticed that the colonies were liable not to get in condition without protection. Last winter, by oversight, we left out 10 small colonies without double walls, and nearly every one of them got down to a handful. Those that were right alongside of them in double walls got through all right. It all depends upon what we understand by disease. If we take Mr. Abbott's definition of abnormal condition, then it is a disease.

Dr. Miller—Suppose you had a colony with nothing but drones in it, would you call that a disease?

Mr. Abbott—A bad one, worse than a convention with no women.

Dr. Miller—How many think that spring dwindling is a disease?

Pres. Root—Let us have a show of hands. How many think spring dwindling is a disease? Now, how many think it is not? Evidently the convention doesn't think it is a disease.

DISINFECTING FOUL-BROODY HIVES.

"Is it best to disinfect foul-broody hives?"

Dr. Mason—Yes, it is just as important to disinfect a hive as it is to disinfect food honey.

Wm. McEvoy, of Ontario—Why not burn it up?

Dr. Mason—It doesn't pay. It is cheaper to disinfect it. Understand me, the question is, "a foul-broody hive."

Pres. Root—The question as I understand it implies a diseased hive in which there have been bees that have had foul brood, that naturally was the intention of the question.

Dr. Miller—Whatever the intention may have been, I think that Dr. Mason raises a good point there, and there is a prior question to be answered. When

a colony of foul-broody bees has been in a hive, is that hive always a foul-broody hive? that is the point he wants raised.

Pres. Root—Is a hive that has contained bees that have had the foul-brood disease necessarily a foul-broody hive?

Dr. Mason—I can answer that just as easily by saying no.

Mr. Kluck—According to Mr. France, the foul brood inspector of Wisconsin, he claims that a foul-broody bee in a hive would make it necessary to disinfect that hive. He gave us to understand in our bee-convention of northern Illinois that that was so.

Mr. McEvoy—It is not possible. Understand, I have thousands of experience in the test cases for pretty nearly 25 years, and I have never had a single old hive disinfected in any way.

Mr. Abbott—Wouldn't it be a good idea if we would bring out exactly what foul brood is, and what is the nature of the disease, and where it manifests itself? If it is a germ, under what condition is that germ developed? That is, where do they locate?

We know that the germ of tuberculosis locates itself in some of the glands of the human body. Now, let us get an answer from Mr. McEvoy, or some one else that has had experience with foul brood. I never had any experience but once. I know from scientific investigation that it is a germ. Now, where is that germ developed? Let these people who do not understand the theory of foul brood see why it should not get into the hive.

Mr. McEvoy—This man has asked one of the most important questions that I have ever heard put in my life. Honey, to become diseased, must first be stored in the stain-marked cells, that is, a cell where the foul matter has dried down, or where the bees are making room for more honey, when they move the honey from an unfilled cell to cells not finished; but when honey is gathered from the fields and stored side by side with these stain-marked cells, the honey in the next cell is sound. It is the only possible way to spread it. Now, take combs from a diseased colony, I don't care how badly it may be affected, if the honey is stored in these new combs that never had brood in, and extracted, and the combs given back to the bees when they are clean, these combs can be used in any hive in the world and not give disease.

Mr. Abbott—Now, then, germs appear in two conditions, the active or germ condition, and the sporadic condition. A germ, when it is active, can be destroyed—I might say in the egg condition. Now, is the germ of foul brood in the egg condition in this dry cell, or is it in the sporadic condition and carried out with the honey and developed with the honey that is put into this cell when it is in that condition? Is it practically a germ dormant in that cell and can not carry or communicate itself to another cell, and can only be imparted to another cell by honey being put on to it, and such a condition created as will hatch the egg and thus spread it out?

Mr. McEvoy—Or that honey moved to another cell and spoil it. As far as I ever went, I know that the honey falling from these cells will give the disease.

Mr. Abbott—Now, then, if that spore, as the scientific men would call it, is placed in another cell, evidently it will develop. If that spore was lodged on the side of a hive, there would not be any possible condition by which that spore would develop on the side of the hive. If it would, why, then, you would have to change your answer?

Sidney S. Sleeper, of New York—Now, are these germs vegetable or animal? In speaking of spores, that would indicate that they were vegetable germs; in speaking of eggs, that would indicate that they were animal germs.

Mr. Abbott—I simply wish to say that I used the word egg so that those people who haven't spent 25 years studying science will know what I mean.

O. L. Hershiser, of New York—Can this dried matter move itself? What I mean is, that when the bees are moved from diseased cells, then one honey is diseasing the other; but as far as it going out from these cells through the hive to enter other cells, I do not think it is possible.

Dr. Mason—What do you mean by its going out?

Mr. Hershiser—What I mean is, that it would sort of rise and go through the colony.

Pres. Root—What he means is, whether the disease would pass through the hive from one cell to another.

Mr. McEvoy—It does not do that.

Dr. Mason—I don't believe it does.

Dr. Miller—I want to confess that the President at one time straightened me out on that. I had gotten it into my head that these things were animals, and that they were eggs.

Mr. Abbott—Germs are animals, sometimes.

Dr. Mason—Are foul-brood germs animals?

Mr. Abbott—I don't think anybody in the house knows.

Dr. Miller—I think if we talk of them as seeds there will be less danger of misapprehension. Suppose the spores had gotten upon the sides of a hive. Now, if those spores were there in connection with honey, and the bees would take that honey, then you might get the disease from that hive, but I can't conceive of it in any other way. If there are spores there on the sides of the hive the bees are not going to take them up in any way. I understand Mr. McEvoy to hold that view, and it seems to me that that ought to make it pretty clear; and I confess to you that I never saw it as clearly as I do tonight. It makes me see more clearly than I ever did before, why he insists upon it in opposition to the views of a great many practical men, that it is not necessary to cleanse the hive, because if the spores are there—if the bacilli are there—they are going to die, aren't they, Mr. Benton?

Frank Benton, of District of Columbia—Not necessarily; the spores might stay there and retain sufficient life to develop. But there is no bee going to take a spore from a dry hive and take it where it will grow.

Pres. Root—The spores are in an inactive state; the bacilli are in an active state.

Mr. Hershiser—I have frequently, in working around a hive, spilled a good deal of honey and it has run down the sides of the hive. Suppose these

spores were present and the bees would carry it into the cell where there was a larva. Isn't that a case where the disease could develop?

Mr. McEvoy—Certainly.

Mr. Hershiser—Sometimes we are working with a hive where we do not give them the opportunity to secure the honey. Suppose they take the honey that is running down the side of a hive, and take it into a cell where there is a larva, wouldn't that communicate the disease?

Mr. McEvoy—Ninety-nine parts out of a hundred of it are pure.

Pres. Root—As I understand Mr. McEvoy, where he speaks of a small portion of the honey being diseased his recommendation is that all the combs or wax be burnt. In order to be sure, he considers it safe to burn every comb.

Mr. McEvoy—Yes, sir, every comb. Mr. Mason—I have had a good deal of experience with foul brood, and I do not exactly agree with Mr. McEvoy because he is the best authority we have on earth. I do not consider it advisable, in my experience, to take foul-broody bees, combs, etc., out of a hive and use that hive without disinfecting. I would not do it. You may lift a frame out of there with the greatest of care and crush a bee with foul-broody honey in it and leave it there, and when it is so easily disinfected, I don't see why it should not be done; but if a hive has foul-broody honey on it, or in it anywhere, it is a foul-broody hive and needs disinfecting, and even Mr. McEvoy will admit that.

Dr. Miller—I want to ask Mr. McEvoy if he ever tried using a hive again that had foul-broody bees in it.

Mr. McEvoy—Oh, thousands of them.

Dr. Miller—I would like to know definitely. I want to know something definite in numbers. Did you ever have half a dozen hives used in that way, or how many? Give us something definite about it.

Mr. McEvoy—I don't know, I suppose I could put it safely at 5,000.

Dr. Miller—Of that 5,000 how many of them ever succeeded in giving the disease?

Mr. McEvoy—Not one, that I ever knew. Not a single case, that I ever knew.

Dr. Miller—Now, if in 5,000 cases that you have tried there has not been a single failure, I am willing to take what risk there is.

Pres. Root—After I had learned of Mr. McEvoy's experience, in which he had tested something like three or four thousand hives at that time, I concluded that we would try to cure the disease without boiling the hives, and ever since that time we have found that we could cure it just the same without boiling the hive. Some years ago, when we had the disease all through our apiary, we boiled all our hives, but we left about 10 of them and thought we would see what would result. I think that there were four or five out of the ten that we left that had the disease, but I have thought since that that experiment did not amount to anything, in view of what Mr. McEvoy says that he has tried it in 5,000 cases.

Mr. Hershiser—I would like to ask how many of those apiaries have been treated more than once, and how many times those apiaries have been treated that have had foul brood?

Mr. McEvoy—That is a close question, and it is all right. You know it is one thing to handle a disease and it is quite another thing to handle the men. Some men would make a perfect cure, others, again, you would have to go to several times, and it is just how they do the work. Some of them will blunder once in a while, but it isn't the hive; they don't do their work; they often put it like this, "Well, how long will I boil the hive?" Now, that depends upon how long you intend to boil the bees; surely, you are not going to do one without the other. Are you going to take these bees that have walked all over the putrid eggs, with their dirty little feet, without boiling them? If you are going to boil the

hive half an hour, I think you ought to boil the bees an hour! And I don't know a place in Ontario where they boil now.

Dr. Mason—Foul-broody hives need disinfecting just as surely as do foul-broody bees, and they can as surely, and more easily, be disinfected without boiling than can bees.

Pres. Root—Perhaps it ought to be stated in this connection that Thomas William Cowan, and quite a number of scientists across the water, feel that it is very necessary to disinfect the hives, but, as I have stated, we haven't disinfected our hives since, and we haven't had any trouble.

Dr. Mason—You haven't had foul-broody hives, then.

Dr. Miller—it seemed to me that it was a foolhardy piece of business for Mr. McEvoy to insist that there was no necessity for disinfecting, for it seemed to me there must be plenty of spores, but if you come to think about it, what is going to take those spores where they can do any harm? And the fact remains that if he has had so many cases, and *knows* that no evil results have come from them, we ought to be able to go on and do what he has done.

W. H. Heim, of Pennsylvania—I should like to know whether those are the only two remedies for the disease—by burning the combs or boiling?

Mr. McEvoy—Do you mean that you think that they can be disinfected?

Mr. Heim—Yes.

Mr. McEvoy—You can use the disinfectant till those combs will fairly smoke, and you try them over again and it will break out.

Pres. Root—I talked with Mr. Gemmill and one of the other inspectors, and asked if his experience coincided with Mr. McEvoy's, and he said it did.

A Member—Do I understand Mr. McEvoy that the combs should be burned up, or made into wax?

Mr. McEvoy—I think they ought to be all turned into wax, and if made into comb foundation it is all right, too.

Ants Fighting Bees—A Colorado Experience.

BY D. W. WORKING.

Small ants often make their nests about hives, to have the benefit of their warmth. They are annoying to the apiarist, but neither molest the bees nor are molested by them. —*Dadant's Langstroth, 1900 edition, page 176.*

YESTERDAY I went out to look at a bee-hive where I had often noticed black ants running about as if they were perfectly at home. There were the ants, as usual, going in and out of the hive and climbing up some other way—whether to help themselves to honey or just for the fun of the thing, I may not say. Possibly their object was to get the benefit of the warmth of the hive. The day was fairly warm and sunny for early October in this land of sunshine. Comparatively few bees were passing in and out of the hive. I went out to look, as I have said. I did more; I got down on my knees to watch, for there seemed to be some excitement.

Watching quietly, as is advisable when you are close enough to see bees and ants "shake their fists" at each other, I saw what made me feel sure of a thing I had be-

fore suspected—that everything you may read in a book is not absolutely true because it happens to be in that particular book. There were the ants actually molesting the bees. Of course the bees were not "molesting" the ants; for an uninvited and unwelcome intruder is not "molested" even when you kick him out of doors for trying to carry off your property. My bees evidently did not like the assurance of the ants, and it appeared to me as if they were trying to put them out of the hive.

Now, what do you suppose these visiting old-maid ants did when they were told at the door that it was not "company day" at that house? Did they make their apologies and go home? Not they. They actually insisted on going in, as if the hives were a post-office and not a private dwelling. When a bee opposed the entrance of one of these bold intruders, she would rise on her hind feet in offended dignity, as much as to say, "Would you get in the way of a lady?" And when the bee answered that the queen's house was to be entered only by those having special invitations, this six-legged Amazon actually attacked the guard and drove it back. The same ant would attack several bees in succession, never seeming to be afraid of the sting of the bees or of their buzzing or scolding. Indeed, it seemed that it was not possible for the bees to injure the ants.

Of course I did not like the insolence of these brazen females. To force their way into my bee-hive was to insult me. Indeed, I suspect that their purpose was robbery. So I picked up the hive and set it a foot or so away from its place. Then there was excitement in autumn. On the bare ground where the hive had stood was a pile of pupae (ants' eggs) looking like a handful of barley-grains, which the

ants immediately began to move to places of supposed safety. The terror of the ants did not soften my hard heart. Calling the chickens, I soon had the satisfaction of seeing a Brown Leghorn pullet begin the work of destroying the prospects of the colony of ants that had been making their home under my bee-hive. How she did seem to relish every fat pupa! And how quickly the other chickens learned to like ants' brood!

Now, this is not a very valuable contribution to bee-literature. Perhaps the black ants which fought my bees are not the "small ants" which "neither molest the bees nor are molested by them." At any rate, it seems worth while to report the fact. Perhaps the wise men will explain it. Perhaps they will tell me that I ought to have killed the ants long ago. At the risk of needlessly exposing an ignorance which is frankly confessed to be great, I venture to add that this particular hive became queenless during the summer, and that the colony failed to rear a queen, although supplied with two frames containing brood in all stages from the egg to the hatching bee, and that at one time there were two or three well-developed queen-cells in the hive. Is it possible that the ants might have robbed the queen-cells?

Arapahoe Co., Colo.

Working for Italian Bees—Pure Mating of Queens.

BY G. M. DOOLITTLE.

QUESTION—I have spent much time during the past summer to Italianize my bees, and think they are now all pure Italian. But my neighbors all about me have black and hybrid bees, many being kept in box-hives, so that hosts of drones are reared in these during the summer season. What I wish to know is, how I, rearing queens for my own use, can secure them purely fecundated.

ANSWER.—There are several plans for the pure mating of queens, but, up to this time, all are more or less faulty. The best of these plans are the following:

In the early spring, as soon as you can find colonies which can spare it, give capped brood to your drone-rearing colonies, and this, together with a little warm feed, given each day, will cause the desired queens to lay in the drone-comb early, through the stimulation given, thus giving you strong colonies with plenty of drones, before your neighbors' colonies rear any drones.

To secure the best results, one or more drone-combs should be placed in the center of the brood-nest at the time you give the sealed brood. As soon as any drone-brood has been capped from 3 days to a week, start to rear queens, and in this way you will have your queens ready for the first drones which appear. The main objection to this plan is, that such rearing of queens comes at a time when it is likely to interfere with your crop of honey; for in all queen-rearing the colony is thrown out of its normal condition; and whether the old queens are taken away from their colonies to give place for the desired queen-cells, or nuclei formed to take care of these cells, this interference comes at a time when all should be booming as much as possible along the line of rearing the bees in time for the honey harvest, which, as a rule, will be from 30 to 50 days ahead.

If I may be pardoned, I will say that I should consider impure stock, with a good yield of honey, very much more preferable than absolutely pure stock and little or no surplus honey.

Another plan is, to wait till fall about rearing queens, if you can preserve the desired drones, till all of your neighbors' drones are killed off, when, if there are no other drones except those you have, you will have every queen to mate with those you have.

To preserve drones, gather all the drone-brood you can find from the queens you have decided shall be drone-mothers, and mass this brood in one hive, tiering it up, if necessary, to accommodate this brood and an abundance of honey; for, the larger the hive and the more honey it contains, the better your chance of having the drones preserved in large numbers. When this drone-brood is massed, the queen should be taken away from the colony; and as often as a new queen commences to lay she should be taken away also, and this colony kept supplied with sufficient worker-brood to keep it in a prosperous condition, for on its prosperous condition depends the fecundity of the flight of the drones on every suitable day. If you wish all of the drones which your queens are to mate with to be strong, robust fellows, on some cloudy day when the bees are not flying so as to endanger robbing, look this hive over and hand-pick the drones, killing all which you think are not such as you would desire. To do this best, take out the first comb and pick out as above, when it is to be put into an empty

hive, set on the stand originally occupied; and thus when you have gone over every comb, and such drones as may cling to the sides and bottom-board to the hive, your colony is just where you want it, without any extra handling of frames.

You are now, in a measure, quite sure that the queens reared will come as near perfection as is possible along the line of right mating, and were it not that this plan requires much extra work, and care in feeding the queen-rearing colonies, so that fairly good queens may be reared out of season; and, also, that this late manipulation of colonies forfeits our chances of successful wintering, this would be the plan above all others to use. And with this plan I have reared queens which have proved of great value to me.

Another plan is to take a hive containing only the best hand-picked drones to some locality isolated 5 miles or more from all other bees, and as often as may be, take a load of nuclei, supplied with virgin queens from the best mother, these being from 3 to 5 days old, to this isolated place, leaving them there from 8 to 10 days, when they can be brought home with laying queens, which will, as a rule, be all mated with the desired drones. With a proper rack fixed on any light spring wagon, from 12 to 25 nuclei can be carried to and fro at one time, so that this is not so very laborious as it at first appears, and it has this advantage: The queens can be reared at a time when nearly every queen will be perfection itself, as in this way all can be reared in the height of the honey season, when the best queens can be reared with the least work.

Still another plan is to rear the queens and drones in the best part of the honey season, and, when ready, take the drone colony and as many of the nuclei as have queens of mating age, to the cellar, or some darkened, cool room, carrying them in before they begin to fly in the morning, and leaving them there till 4 o'clock in the afternoon, or till after all other drones have ceased flying for the day. If each nucleus and the drone colony are fed a little warm diluted sweet just before setting out, and the hives face the western sun, queens and drones will fly something as they usually do in the early afternoon, and the results will prove quite satisfactory.

Onondaga Co., N. Y.

* The Afterthought. *

The "Old Reliable" seen through New and Unreliable Glasses.

By E. E. HASTY, Sta. B Rural, Toledo, O.

"UNREADING" ONE'S SELF.

Yes, Mr. Weaver, it is sometimes a good plan for the beginner to "unread himself" and go in on his own hook. Bees differ very greatly as to their amenability to "drumming." There are some (and very provoking ones they are) that will all get in army formation and march out of the hive wherever they can get out, if you but manipulate their frames a little. Others are like yours. However, a beginner should take a watch along for such a job, and give them a reasonable number of *actual* minutes before unreading everything—otherwise his 10 minutes might be about 2 minutes. "All's well that ends well," but the main danger of your method is that the queen may keep your strips of old comb full of brood all the while. Even if zinc is used there is some danger of getting some new honey in very undesirable shape.

GLUCOSE CAN BE FED, BUT DON'T.

It is somewhat in the line of news to be told that one can feed a ton of glucose to his bees. Editorial, page 579.

MILLIONAIRE BEE-KEEPERS.

Want the names of millionaire bee-keepers, eh? Well, I'm one—own a million dollars' worth of independence and good hopes, and none of J. Pierpont Morgan's paper brings in larger returns. Few vocations have so large a proportion of *real* millionaires as ours. I take it. Page 574.

THE VIRGIN QUEEN SURVIVES.

It is an interesting bit of experience from C. Davenport, that when two colonies are lived together, one with a laying queen and one with a virgin, it is usually the virgin which survives. That would naturally be the case where the bees do not ball either of them, but just let them fight it out themselves—virgin too spry for heavy old dowager. Page 582.

HOW THE SICILIAN BEE-KEEPERS DO.

We have closed standing frame hives both with and without outer shells; but the Sicilians are unique in *plastering* on an outer shell upon movable standing frames. The plastering is to be repeated after each manipulation, I suppose. With a frame only 8x8 bees are not so anxious to curve the comb around as in frames horizontally long, so quite possibly a bamboo top-bar might need no comb-guide. Page 582.

CAUSES OF QUEEN-BEARING FAILURES.

And so Doolittle suspects that wrong moves in transferring the larvae are responsible for most of the failures—the quite moderate percent of failures—in rearing queens by the Doolittle method. It is a shrewd test experiment which he suggests—take out the larvae from some natural cells which the bees undoubtedly cherish and see if you can put others in successfully. Page 582.

HUGGING TO DEATH.

We know that the same facts can oft be read in different ways. We are pleased to hear (pleased in one sense of the term) that bees are not trying to worry the drones to death—only hugging them in the affectionate effort to dissuade them from suicide. And if, to dissuade Mr. Archibald from the suicide of extracting from combs with brood in them, just the right body would didactically and effectively hug him—well, it would be a good deed. Page 587.

POSITION OF NECTAR-GLANDS.

I think Prof. Shimek is hardly wise in his choice of words when he says that nectar-glands are concealed. The conditions of the case make it necessary that they be placed behind the spots which bees are being lured to touch unwittingly, and concealment comes in as an undesirable result. Page 588.

"ENJOYING LIFE"—SELFISHNESS.

I like the talk from Gleanings in Bee-Culture, on page 589, about the philosophy and plan of human occupation and life; but, still, I greatly wish some one could give, intelligibly and victoriously give, just a little different turn to the phrase "enjoying life." A man wrongly devoted to the enjoyment of life is a kitten running after its own tail. And in just that sort of a quest multitudes of well-bred, intelligent people make their lives into wrecks—make themselves unfit persons to be in any imaginable world which God is to stay in over night. We *must* have some banner before us which does not have "self, self, self," written all over it.

* The Home Circle. *

EDUCATION.

What a wealth of philosophy, and what a mine of truth, are to be found in the familiar scriptural adage, "It is the little foxes that spoil the vine." Is it not equally true that some little word, or apparently trifling event, makes a life a man? A fond teacher in my early boyhood—one of those rare persons who take by storm the love, respect, admiration of all whose lives they touch—said a word that aroused in me a quenchless ambition for that which else I would never have scented. That word was "College." She said, what I have seen illustrated in many lives since that time, "If you wish it hard enough, you can get a college education; a thorough education would be worth more than a gold-mine to you."

I wish some happy parent, or some fortunate teacher, or some other good angel, could blaze this truth into the mind of every bright boy and girl the country over. We should wish most fondly and most earnestly that all our children should covet the very best gifts. Certainly high among the best treasures of any life is a rich, broad culture of the mind. Only one thing transcends it, and that is a rich soul-culture.

Were I to be a ditcher, or a stone-crusher in the hot sun by the roadside, I should wish a good, thorough education to be my companion then and there. The education would not only somewhat lift me out of the ditch, and away from the stone-pile, but it would do even better, it would help me to enjoy the life with the spade and the hammer. One thoroughly educated can find real pleasure in the opening ditch or the break-

ing stone. Shakespeare was, as always, wise. Those with eyes to see can find books in the running brooks.

A good friend writes commending my "Home Circle" teaching, but wishes I could be brought to see that Saturday, not Sunday, was the sacred day. Another wishes I could be consistent and vote for prohibition. I have no retort for either. We may well remember Paul's word, "Some esteem one day better than another; some esteem all days alike." Paul did not follow this with a thrust at either. He said, "Be well persuaded in your own minds." That is very wise advice. Let us all study both these questions, and all others that divide public opinion as thoroughly as we may, then decide as carefully as we have studied, and then act upon our convictions. If we do this we shall please God, I am sure. If this results in our keeping Saturday, then well; if in keeping Sunday, then well. If it makes us vote prohibition, God will smile; if it makes us vote other tickets, God will also smile. God does not demand perfection of any of us. "Only one, your father in heaven, is perfect." He does demand earnest, honest study, as a requisite to right judgment. The good education makes the hard study easier, and the succeeding judgment more correct. The good education does, or ought to do, a better thing. It makes us charitable, tolerant towards others who also have studied and decided differently. It recognizes that all fail of deciding wisely and rightly at times; and instead of a word of condemnation to those who differ from us, we re-examine our own views, lest, perchance, we may be in error.

I keep Sunday, and generally vote the Republican ticket. I believe I please God in doing so. If my friends have studied as best they may, and have decided as conscientiously as the importance of the questions demand, then they, too, please God. God be praised for the best mind-culture. That not only helps us to right decision, but makes us kindly, charitable towards him who is led to different decision.

One of the most blessed things of our day is the greater tolerance which we give to those who think not as we do. Education, clarified and sweetened by the Christ spirit, is the glorious parent of this broader charity.

LANDSCAPE GARDENING.

In my institute work of late, I have been happy in being associated with a bright landscape gardener and floriculturist. In his lectures he gave three principles which he said should control in all laying out of home grounds, whether in the restricted city lot or in the more spacious environs of country.

First, "Avoid straight lines."

Second, "Preserve open lawn centres."

Third, "Plant in groups, not singly."

I have listened more pleasantly as we have followed two of these rules in our own landscaping. We have no straight lines in walk or drive, and I am glad curves are more pleasing than right lines. Our little white clover lawn is all the richer and more thrifty in having all to itself. A tree or shrub in a lawn almost always looks as if it felt out of place. Its foliage looks pale and sickly. My plants are isolated, and not in groups. They are not regular. On my small place I doubt if grouping would have given us more pleasure. Of course it would if more artistic, more after Nature's pattern. Is this true in such confined limits?

"DEAR DAUGHTER DOROTHY."

This is a charming story for the children. Like that fascinating book, "Captain January," it should be in all our home-circles where children abound. The book makes a child do impossible things, but in such a realistic way that we forget that it could not be realized in life. It is charming, too, to see how perfect is the union in thought and feeling between father and daughter. Such a picture of home life is beautiful to hang on memory's walls. I urge every home circle to get these two books, and read them aloud in the home circle. If the scene in "Captain January," where separation is proposed, brings tears, and raises the heart throatward, we shall be all the better for it.

I remember how our whole household, years ago, generated dampness under the eyebrows, when we read "Uncle Tom's Cabin" aloud in the old home. It was good to cry. Such scenes were common wherever this great classic was read. They were good tears, and were not without influence in the stormy days of the early sixties.

Queenie Jeanette is the title of a pretty song in sheet music size, written by J. C. Wallenmeyer, a musical bee-keeper. The regular price is 40 cents, but to close out the copies we have left, we will mail them at 20 cents each, as long as they last.

FOR GETTING NEW SUBSCRIBERS.

Red Clover Queens FOR 1902 Free

Long-Tongue Variety—Warranted Purely Mated.

We have already arranged with the queen-breeder who furnished Long-Tongue Red Clover Queens for us during the past season, to fill our orders next season. Although fully 95 percent of the untested queens he sent out were purely mated, next season all that he mails for us will be **warranted** purely mated.

We want every one of our present subscribers to have one or more of these money-maker Queens. We have received most excellent reports from the queens we supplied during the past season. And next year our queen-breeder says he expects to be able to send out even better Queens, if that is possible. He is one of the very oldest and best queen-breeders. His bees average quite a good deal the longest tongues of any yet measured. The Breeder he will use is direct from Italy, having imported her himself. Her worker-bees are large, of beautiful color, very gentle, scarcely requiring veil or smoke.

Orders for these fine, "long-reach" Warranted Queens will be filled in rotation—"first come, first served"—beginning as early in June as possible. It is expected that orders can be filled quite promptly (even better than the past season), as a much larger number of queen-rearing nuclei will be run. (But never remove the old queen from the colony until you have received the new one, no matter from whom you order a queen).

All Queens will be guaranteed to arrive in good condition, and will be clipped, unless otherwise ordered.

A Warranted Queen for sending us Only 2 New Yearly Subscribers

In order that every one of our subscribers who wants one of these Warranted Queens next season can easily earn it, we will book your order for one queen for sending us the names and addresses of **two new subscribers** to the American Bee Journal and \$2.00. FURTHERMORE, we will begin to send the Bee Journal to the new subscribers just as soon as they are received here (with the \$2.00), and continue to send it until the end of next year, 1902. So, forward the new subscriptions soon—the sooner sent in the more weekly copies they will receive.

This indeed is an opportunity to get a superior Queen, and at the same time help swell the list of readers of the old American Bee Journal.

We are now ready to book the Queen orders, and also to enroll the new subscriptions. Remember, the sooner you get in your order the earlier you will get your Queen next season, and the more copies of the Bee Journal will the new subscribers receive that you send in. We hope that every one of our present readers will decide to have at least one of these Queens. Address,

Had Good Honey-Flows.

My bees have done well this year. We had a good honey-flow the last of June and the first part of July from mesquite, catclaw, and alfalfa, and now have a good flow from alfalfa and wild flowers.

The American Bee Journal has been a great help to me in my bee-business. I do not see how I could have done without it.

Hairy Vetch as a Honey-Plant.

In response to the request for information regarding the hairy vetch as a honey-plant, I can say this:

About six years ago I received from the Agricultural Department at Washington a package labeled, "Sand or Hairy Vetch." I sowed a small plot with the seed, and it has grown there ever since, coming up every spring from seed grown there the year before, I suppose. It yields a fine forage, and blooms all summer beautiful blossoms, but I never saw a honey-bee on one of the blossoms in all these years. Bumble-bees and butterflies

To make cows pay, use Sharples Cream Separators. Book "Business Dairying" & Cat. 212 free. W. Chester, Pa.

Farming by Lottery.

The recent drought has emphasized the element of chance in farming under ordinary conditions, whereas on

AN IRRIGATED FARM

crops never fail or are damaged by bad weather in harvest. The yield is larger, quality better and prices of the products higher.

Our Irrigation Settlement Plan

affords an opportunity for securing a well-located, irrigated farm at half the usual prices, on easy terms, with ABUNDANT WATER, RICH SOIL, HOME MARKETS at good prices. Wheat yields, 50 bu.; oats, 100 bu.; potatoes, 300 bu.; alfalfa, 5 tons per acre regularly each year.

are frequently seen there, but never a honey-bee, although my apiary is within a few rods of there.

J. A. McDonald may refer to some other variety of the vetch, or his location may modify the length of the tubes of the blossoms. I think the vetch I have produces nectar, but the bees I have are unable to reach it. However, as I have recently purchased a long-tongued queen I am in hopes I can make a more favorable report for the vetch in a year or two. There are still a few vetch blossoms to be found, and I send you two herewith, and a spray of the leaves; also an alfalfa blossom for comparison.

It has been a poor honey season here, no surplus to speak of.

J. W. STEELE.

Merced Co., Calif., Oct. 7.

The Mulberry for Bees.

When we wrote before we had taken off 500 pounds of honey, and thought we would have about 150 pounds more. When we took it off we had 500, making 1000 pounds in all, from 11 colonies, spring count.

I see quite a good deal in the American Bee Journal about the mulberry for bees. I think if we had nothing else for them but mulberries we could keep any honey. We never see bees working on the mulberry only when they can't find anything else to do, then they will work on the white mulberry a little.

Dr. Peiro said, on page 605, we should insert cuttings in July or August. If we were to do that here, it would be very few trees we would get. We have hundreds of mulberry trees, and have bushels of berries every year. I bought a package of seed for 10 cents, and from these I raised 300 trees. I think this is the cheapest way to get mulberry trees. You can buy one-year-old trees from the nursery for about \$3.00 a 1000. There are male and female trees, and when they blossom the bees will work on the male trees, and get pollen from the blossoms, but those don't have any berries. If Dr. Peiro can find any cheaper way to get mulberry trees, we would like to hear from him again.

R. CHINN.

Dixon Co., Nebr., Oct. 4.

Quoting the Honey Market.

I wish to enter a protest against the statement made in the market report from Omaha and from Kansas City, and signed "Peycke Bros." They say Colorado and Utah shippers are offering honey for 10 cents per pound, and in the Bee Journal of Aug. 22, at \$2.40 per case. Now, as a matter of fact, the Honey-Producers' Association of Denver have been paying \$2.75 per case all the fall, and Peycke Bros. knew it, for their man has been at Denver and called at the Association rooms. Such statements are not only an injury to the beekeepers here, but also to the country, as having a tendency to lower the price of honey.

Peycke Bros. say in the same report that honey is selling in Kansas City for 16 to 17 cents per pound. Is not 4 to 7 cents per pound a pretty good profit?

We look to the American Bee Journal to help the beekeepers, not to injure them, and certainly such a report does them.

"COLORADO."

[The foregoing was not sent us for publication, but as we have not used the writer's name, we think he will not object to its appearance.

We certainly do not want our market columns to injure producers, and are indeed glad that "Colorado" has written to us. We imagine that the "10 cents" referred to was an error on the part of "Peycke Bros." Suppose we invite them to explain the matter. — EDITOR.

1901—Bee-Keepers' Supplies!

Development of the Queen.

In Gleanings in Bee-Culture, Dr. C. C. Miller discusses the matter of queen development. After considering the time from the laying of the egg to hatching, and to the sealing of the larva, he says:

The most important of the questions, from a practical standpoint, is, "How long from the laying of the egg to the emerging of the queen?" In the American Bee Journal, Vol. I., page 198, in a chapter of the able series of articles on the Dzierzon theory, by the Baron of Berlepsch, after detailing some experiments, he says:

"These experiments show that the opinion generally entertained, that the queens emerge between the 17th and 18th day after the eggs are laid, is correct."

The time of writing this, however, antedates the publication of the Journal, 1861; and elsewhere in general throughout the volume 10 days is accounted the proper time. Indeed, on page 266, Dzierzon gives a definite case in which the time was only 15 days. Sixteen days has of late years been accounted the orthodox term. I think, in general, in all the books excepting Cowan's, which gives 15 days. This year I thought I would refer to the two latter questions to the bees, so as to get a positive answer in at least one case. July 18, at 10 a.m., I took from No. 35 its brood, leaving in the hive foundation and one comb containing some sealed brood, this comb having been kept for more than a week where there was no possibility of a queen laying in it. Four days later I gave this comb to No. 35, after having removed from No. 35 its queen and brood. July 26, at 10 a.m., when the oldest brood could not have been more than eight days old, I found 20 sealed queen-cells on the comb, and seven unsealed. The proof is clear and positive that these 20 cells that were sealed contained larvae not any more than eight days from the laying of the egg. It is reasonable to suppose that the seven unsealed cells contained younger larvae. Desiring to save all the cells, I did not wait till any of the occupants were quite 15 days old from the laying of the egg, but opened the hive at 9:45 a.m., Aug. 2. I was doomed to disappointment, for seven young queens had already emerged.

In this case there could be no question. The cells were sealed in eight days; and allowing three days in the egg, there were five days of feeding; and the queens emerged in 15 days from the laying of the egg. These figures agree with those of Mr. Cowan. It should not for a minute be supposed that they admit of no variation. But it is probable that, under normal conditions, they may

BEST Extracted Honey For Sale

ALL IN 60-POUND TIN CANS.

Alfalfa
Honey

This is the famous White Extracted Honey gathered in the great Alfalfa regions of the Central West. It is a splendid honey, and nearly everybody who cares to eat honey at all can't get enough of the Alfalfa extracted.

Basswood
Honey

This is the well-known light-colored honey gathered from the rich, nectar-laden basswood blossoms. It has a stronger flavor than Alfalfa, and is preferred by those who like a distinct flavor in their honey.

Prices of Alfalfa or Basswood Honey:

A sample of either, by mail, 10 cents, to pay for package and postage. By freight—two 60-pound cans of Alfalfa, 8 cents per pound; four or more cans, 7½ cents per pound. Basswood Honey, ½ cent more per pound than Alfalfa prices. Cash must accompany each order. You can order half of each kind of honey, if you so desire. The cans are boxed. This is all

ABSOLUTELY PURE HONEY

The finest of their kinds produced in this country.

Read Dr. Miller's Testimony on Alfalfa Honey:

I've just sampled the honey you sent, and it's prime. Thank you. I feel that I'm something of a heretic, to sell several thousand pounds of honey of my own production and then buy honey of you for my own use. But however loyal one ought to be to the honey of his own region, there's no denying the fact that for use in any kind of hot drink, where one prefers the more wholesome honey to sugar, the very excellent quality of alfalfa honey I have received from you is better suited than the honeys of more marked flavor, according to my taste.

McHenry Co., Ill.

C. C. MILLER.

Order the Above Honey and then Sell It.

We would suggest that those bee-keepers who did not produce enough honey for their home demand this year, just order some of the above, and sell it. And others, who want to earn some money, can get this honey and work up a demand for it almost anywhere.

be relied upon as coming as near the average as anything that can be given. The question may arise, why it is that 16 days for the full development of a queen has so generally been agreed upon. Many of the observations have been made, not upon full colonies, but upon nuclei. Development will be retarded in nuclei. In the American Bee Journal, Vol. I, page 143, Father Langstroth reports a case in which a queen in a nucleus was 21 days in coming to maturity. In my early days of bee-keeping I knew no better than to have queens started in nuclei, and I had cases like that of Father Langstroth. But in full colonies I have had many, many incidental proofs that 15 days was the limit. Ought we not to change our belief from 16 to 15?

Hiving on Foundation.

Foundation, full sheets of it, is something that a newly hived swarm does not like; at least, Messrs. Hall and Abough of Ontario, Canada, assert that such is the case; that they are much more likely to swarm out when hived on full sheets. Mr. Abough says he believes that bees don't realize at first what foundation is for—that they don't comprehend at first that they can make combs of it. When they find themselves in a hive filled full of sheets of wax placed 1/4 inches apart, they get to themselves: "This is no place for us. There is no opportunity to build comb here with the space all divided in this way. Let's get out of it." Mr. Abough prefers to have in an empty box, which gives the bees an opportunity to cluster contentedly in a nat-

BEE-BOOKS

SENT POSTPAID BY

George W. York & Co.

Chicago.

Bees and Honey, or Management of an Apiary for Pleasure and Profit, by Thomas G. Newman.—It is nicely illustrated, contains 160 pages, beautifully printed in the highest style of the art, and bound in cloth, gold lettered. Price, in cloth, 75 cents; in paper, 50 cents.

Langstroth on the Honey-Bee, revised by Dadant.—This classic in bee-culture has been entirely re-written, and is fully illustrated. It treats of everything relating to bees and bee-keeping. No apiarist's library is complete without this standard work by Rev. L. L. Langstroth—the Father of American Bee-Culture. It has 520 pages, bound in cloth. Price, \$1.25.

Bee-Keepers' Guide, or Manual of the Apiary, by Prof. A. J. Cook, of the Michigan Agricultural College.—This book is not only instructive and helpful as a guide in bee-keeping, but is interesting and thoroughly practical and scientific. It contains a full delineation of the anatomy and physiology of bees. 460 pages, bound in cloth and fully illustrated. Price, \$1.25.

Scientific Queen-Rearing, as Practically Applied, by G. M. Doolittle.—A method by which the very best of queen-bees are reared in perfect health and vigor, the author's way. Bound in cloth and illustrated. Price, \$1.00.

A B C of Bee-Culture, by A. I. Root.—A cyclopedia of 400 pages, describing everything pertaining to the care of the honey-bees. Contains 300 engravings. It was written especially for beginners. Bound in cloth. Price, \$1.25.

Advanced Bee-Culture, Its Methods and Management, by W. Z. Hutchinson.—The author of this work is a practical and entertaining writer. You should read his book; 90 pages, bound in paper, and illustrated. Price, 50 cents.

Rational Bee-Keeping, by Dr. John Dzierzon.—This is a translation of his latest German book on bee-culture. It has 350 pages, bound in paper covers. \$1.00.

Bienen-Kultur, by Thos. G. Newman.—This is a German translation of the principal portion of the book called "Bees and Honey." 100-page pamphlet. Price, 25 cents.

Einenzucht und Honiggewinnung, nach der neuesten methode, German, by J. P. Egeder.—This book gives the latest and most approved methods of bee-keeping in an easy, comprehensive style, with illustrations to suit the subject. 50 pages, board cover. Price, 50 cents.

Bee-Keeping for Beginners, by Dr. J. P. H. Brown, of Georgia.—A practical and concise treatise on the honey-bee, giving the best modes of management in order to secure the most profit. 10 pages, bound in paper. Price, 12 cents.

Bee-Keeping for Profit, by Dr. G. L. Tinker.—Revised and enlarged. It details the author's "new system, or how to get the largest yield of comb or extracted honey." 80 pages, illustrated. Price, 25 cents.

Apiary Register, by Thomas G. Newman.—Devotes two pages to a colony. Leather binding. Price, for 50 colonies, 1.00; for 100 colonies, \$1.25.

Dr. Howard's Book on Foul Brood.—Gives the McEvoy Treatment and reviews the experiments of others. Price, 25 cents.

Winter Problem in Bee-Keeping, by G. R. Pierce.—Result of 25 years' experience. 30 cents.

Foul Brood Treatment, by Prof. F. R. Cheshire.—Its Cause and Prevention. Price, 10 cents.

Foul Brood, by A. R. Kohnke.—Origin, Development and Cure. Price, 10 cents.

Capons and Caponizing, by Dr. Sawyer, Fanny Field, and others. Illustrated. All about caponizing, and tells how to make the most money in poultry-raising. 64 pages. Price, 20 cents.

Our Poultry Doctor, or Health in the Poultry Yard and How to Cure Sick Fowls, by Fanny Field.—Everything about Poultry Diseases and their Cure. 64 pages. Price, 20 cents.

Poultry for Market and Poultry for Profit, by Fanny Field.—Has everything about Poultry business. 64 pages. Price, 20 cents.

nal manner, and then set a hive, furnished with sheets of foundation over the box. Gradually the bees clamber up on the foundation, discover its nature and their opportunities, and box below will be deserted—but sometimes not until quite a little comb has been built.—Bee-Keeper's Review.

Introducing Queens.

Mr. Alley has introduced thousands of virgin queens by the following method: The nucleus is kept queenless for three days—72 hours—then the entrance is closed with a plantain leaf, the bees given a dose of tobacco-smoke through the feed-hole in the top of the hive, and the queen immediately run in through the same place, and the hole is closed. By morning the leaf is dry enough to blow away, and offers no obstruction to the bees. He uses the leaf to keep the bees in, and so that they may not recover too quickly from the effects of the tobacco. He says failure is practically unknown. One of his plans for immediate introduction of a fertile queen is to remove the old queen, drive all the bees from the combs into the cover or box, drop the new queen into the cluster, and let the bees go back to the combs at their pleasure. Again, pick the old queen from the swarm, and let the new queen drop among the bees as they are entering the hive.—ARTHUR C. MILLER, in the Bee-Keeper's Review.

Prevention of Increase.

Although not prevention of swarming, it is given after this fashion in the Bee-Keeper's Review:

Hiving swarms so as to prevent increase, and secure good results in honey, is managed as follows by Mr. J. B. Hall, of Ontario: The first swarm is hived upon the old stand, and the bees are placed by the side of it. On the eighth day all the bees (queens and all, if any are hatched) in the old hive are shaken down in front of the swarm that was hived eight days before on the old stand; any remaining queen-cells are mashed down, and

Standard Belgian Hare Book!

BY M. D. CAPPS.

THIS book of 175 pages presents a clear and concise treatment of the Belgian Hare industry; its growth, origin, and kinds; the sanitation and construction of the rabbitry; section of breeding stock; care of the young, feeding, diseases and their cures, scoring, marketing, shipping, &c. First edition of 50,000 copies was sold in advance of publication.

Exact size of the Pen.

the next swarm that issues is hived on these combs of sealed brood. Mr. Hall says that a swarm won't stay if hived on combs of sealed brood, but that it will stay on combs of sealed brood. He says further, that swarms don't like full sheets of foundation.

Returning Swarms to Parent Stand.

Editor Root, in *Gleanings in Bee-Culture*, gives a modified plan which some may like, only it must always be borne in mind that there would be severe loss if enough bees did not promptly hatch out to take care of the brood, especially if a cool night should come. He says:

Our neighbor, Vernon Burt, has succeeded as usual in getting a good crop of honey. He returns all the swarms to the parent stand, giving the swarm a hive of empty combs, then putting the super from the old hive on top of the new one. If the weather is warm, he shakes or brushes all the bees off the combs of the parent hive, and then moves it to another location. Hatching brood will usually come out in time to take care of the young brood. In this way he gives the swarm all the strength it originally possessed; and by so doing he finds he gets the best working force possible. This plan is a combination of the return-swarm plan and of the Stachelhausen brush-swarm idea. But he says he is always careful to see there is hatching brood to make sure that the unsealed brood will not starve. He takes the further prevention of brushing only during hot weather. Of course, during the swarming season there will be no robbing, and no fear need be entertained from that source.

Rocky Mountain Bee-Plant Seed!

(*Cleome integrifolia*)

...FREE AS A PREMIUM...

The ABC of Bee-Culture says of it: "This is a beautiful plant for the flower-garden, to say nothing of the honey it produces. It grows from two to three feet in height and bears large, clusters of bright pink flowers. It grows naturally on the Rocky Mountains, and in Colorado, where it is said to furnish large quantities of honey."

We have a few pounds of this *Cleome* seed, and offer to mail a 1/4-pound package as a premium for sending us ONE NEW subscriber to the *American Bee Journal*, with \$1.00 or 1/2 pound by mail for 40 cents.

GEORGE W. YORK & CO.

CONVENTION NOTICES.

Chicago.—The executive committee of the Chicago Bee-Keepers' Association has ordered that the next convention be held all day and evening, Dec. 5, 1901, at the Briggs House club-room. This is arranged on account of the low rates to be in force then for the International Live-Stock Exposition, Chicago, at that time. Nov. 30 to Dec. 7, being one fare plus \$2.00 for the round-trip. This notice goes by mail to nearly 300 bee-keepers near Chicago, and should result in the largest attendance we have ever had. Dr. C. C. Miller and Mr. C. P. Dant have promised to be present. Let all come.

HERMAN F. MOORE, Sec.

GEORGE W. YORK, Pres.

Colorado.—The Colorado annual meeting promises to be a genuine success. The program has been made out for a number of weeks, and is almost ready for publication. It has come to be a privilege and an honor to read a paper before our Association, and so very few decline who are invited to write or speak for instruction. One paper is already in the hands of the secretary. On two or three nights a big magic lantern will illustrate talks by famous students of bees and the bee industry. And then we are going to have an exhibition of the choicest honey in the United States made in Colorado, you know, and wax, with bees enough to show "how the thing is done."

If you want to know more, or have forgotten the dates, Nov. 18, 19, 20, write to the undersigned, box 42, Denver, Colo.

D. W. WORKING, Sec.

HONEY AND BEESWAX

MARKET QUOTATIONS.

CHICAGO, Oct. 19.—There is a very good trade in No. 1 comb honey at 15c per pound; that which will not grade No. 1 or fancy sells at from 12c-14c; some small lots of fancy have brought more than 15c; light amber selling at 12c-13c; the dark honeys of various grades range at from 10c-11c. Extracted sells fairly well at 5 1/2c-6c; for white, according to quality and flavor; white clover and basswood, including 7c; light amber, 5 1/2c-5 3/4c; dark, 5c-5 1/2c. Beeswax steady at 20c. R. A. BURNETT & Co.

CINCINNATI, Aug. 10.—The honey market is rather dull on account of the warm weather. Extracted sells only to manufacturers from 5c-6c; better grades alfalfa white-white from 6c-7c; white clover and basswood, 5c-6c. Fancy white comb honey sells from 13 1/2c-15c.
C. H. W. WEBER.

BOSTON, Oct. 12.—Fancy 1-pound honey in cartons, 16c; A No. 1 in glass or cartons, 15c; No. 1, 14 1/2c-15c; very little No. 2 being received. Light amber extracted, 7 1/2c.

BLAKE, SCOTT & LEE.

ALBANY, N. Y., Sept. 19.—We quote: Fancy white comb, 16c; No. 1, 15c; mixed, 13c-14c; No. 1 buckwheat or amber, 12c; honey extracted, white, 7c-7 1/2c; light, 6 1/2c-7c; dark, 5 1/2c-6c. Beeswax, 20c-21c.
H. R. WRIGHT.

OMAHA, Aug. 8.—New comb honey is arriving by express in small quantities from Iowa and Colorado, and selling at \$3.50 per case in a retail way. California extracted honey is being ordered carlots at 12c per pound, l.o.b. California shipping-points, but we have not heard of any sales having been made thus far. The production of extracted honey seems to be quite large this year in Colorado, Utah and California.
PEYCKE BROS.

NEW YORK, Oct. 18.—Comb honey is in good demand and finds ready sale at the following quotations: Fancy white, 15c per pound; white, 13c-14c; amber, 12c; buckwheat, 10c-11c. Extracted rather quiet at 6c-6 1/2c for white, and 5 1/2c-6c for amber. Beeswax rather quiet at 20c-21c.
HILDEBRATH & SPOKLEN.

DES MOINES, Aug. 7.—There is very little doing here in new crop of honey. Some small lots of near-by produced comb honey are on the market and selling in a retail way at \$3.50 to \$3.75 per case. We do not look for much trade in this line before Sept. 1. Our market does not seem a great deal of extracted honey.
PEYCKE BROS. & CHANEY.

DETROIT, Aug. 12.—Fancy white comb honey, 14c-15c; No. 1, 13c-14c; no dark to quote. Extracted, white, 6c-7c. Beeswax, 20c-21c.
M. H. HUNT & SON.

SAN FRANCISCO, Oct. 9.—White comb, 10c-12c; amber, 7c-9c; dark, 6c-7c. Extracted, white, 5 1/2c-6c; light amber, 4 1/2c-5c; amber, 4c-5c.

Of late of both comb and extracted, especially of other than most select qualities, are ahead of the immediate demand at full current rates. There is little selling pressure, however, and market is ruling steady as to values.

KANSAS CITY, Sept. 14.—Up to the present time only small lots of new comb honey have been on the market and they are now ready for sale on the basis of 15c per pound for fancy white. For next week heavier receipts are expected and quotations are issued at \$1.00-1.25 per case for large lots, which would be equal to about 14c-14 1/2c; the demand being quite brisk, a firm market is anticipated. Inquiries for extracted are a little more numerous, but large buyers will have to wait as the bees too low. In a small way 5 1/2c-6c is quotable.

A New Bee-Keeper's Song—

"Buckwheat Cakes and Honey"

Words by EUGENE SECOR.

Music by GEORGE W. YORK.

This song was written specially for
the Buffalo convention, and was sung
there. It is written for organ or piano,
as have been all the songs written for
bee-keepers. Every home should have
a copy of it, as well as a copy of

"THE HUM OF THE BEES in the APPLE-TREE BLOOM"

Written by

EUGENE SECOR and DR. U. C. MILLER.

PRICES—Either song will be mailed
for 10 cents (stamps or silver), or both
for only 15 cents. Or, for \$1.00 *strictly*
in advance payment of a year's sub-
scription to the American Bee Journal,
we will mail both of these songs free,
if asked for.

RED CLOVER QUEENS

BLACK ROCK, N. Y., Sept. 3, 1901.

FRIEND ERNEST:—I will try and tell you what you want to know about that queen. I got
her of you in 1899 as a premium with GLEANINGS. I never saw a small colony of bees build up
as that one did. In the spring of 1900 they came out in fine shape, wintered perfect. I raised them
up in May and gave them 8 frames more so the queen would not want for room. I never saw such
a colony of bees as they were in June, and they were actually storing honey when other bees in
my yard were starving. Not! they were not robbing. I never saw those two best colonies of mine
trying to rob. THEY CERTAINLY WORK ON RED CLOVER. This is no guesswork, as I
have seen them. As you know, the past two seasons have been very poor, and what honey my
bees did get in 1900 candied soon after cold weather set in. I packed this colony in a chaff hive
and left them out, thinking that such a strong colony would winter perfect. The snow came on
the middle of November, and those poor bees never a fly until the last of March or the first of
April. When warm weather at last came I thought they were dead, as they did not seem to be flying
much, so I did not pay any attention to them until in June. I noticed they were working a
little, so I opened up the hive and found them in the upper story. I took the lower story out and
left them in the one body. The queen was laying nicely, and I thought they would make a good
colony to winter. Along the last of July I noticed that they needed more room. I gave them
super, 24 boxes, and in a few days they had it full. They have made 72 boxes of as nice honey as
you ever saw, and are drawing out some starters now, Sept. 2.

Very truly yours,

GEO. B. HOWE.

MEMBERSHIP DUES, \$1.00 a year.

If more convenient, Dues may be sent to the office of the American Bee Journal, when they will be forwarded to Mr. Secor, who will mail individual receipts.

A Celluloid Queen-Button is a very pretty thing for a bee-keeper or honey-seller to wear on his coat-lapel. It often serves to introduce the subject of honey, and frequently leads to a sale.

NOTE.—One reader writes: "I have every reason to believe that it would be a very good idea for every bee-keeper to wear one of the buttons as it will cause people to ask questions about the busy bee, and many a conversation thus started would wind up with the sale of more or less honey; at any rate it would give the bee-keeper a superior opportunity to enlighten many a person in regard to honey and bees."

The picture shown herewith is a reproduction of a motto queen-button that we are furnishing to bee-keepers. It has a pin on the underside to fasten it.

Price, by mail, 6 cents; two for 10 cents; or 4 for 25 cents. Send all orders to the office of the American Bee Journal.

Langstroth on... The Honey-Bee

Revised by Dadant—1900 Edition.

This is one of the standard books on bee-culture, and ought to be in the library of every bee-keeper. It is bound substantially in cloth, and contains over 500 pages, being revised by those large, practical bee-keepers, so well-known to all the readers of the American Bee Journal—Chas. Dadant & Son. Each subject is clearly and thoroly explained, so that by following the instructions of this book one cannot fail to be wonderfully helped on the way to success with bees.

The book we mail for \$1.25, or club it with the American Bee Journal for one year—both for \$1.75; or, we will mail it as a premium for sending us THREE NEW subscribers to the Bee Journal for one year, with \$3.00.

This is a splendid chance to get a grand bee-book for a very little money or work.

GEORGE W. YORK & CO.

144 & 146 Erie Street, CHICAGO, ILL.

—THE— The Bee-Keeper's Guide; Or, Manual of the Apiary, —BY— PROF. A. J. COOK.

460 Pages—16th (1899) Edition—18th Thousand—\$1.25 postpaid.

A description of the book here is quite unnecessary—it is simply the most complete scientific and practical bee-book published to-day. Fully illustrated, and all written in the most fascinating style. The author is also too well-known to the whole bee-world to require any introduction. No bee-keeper is fully equipped, or his library complete, without THE BEE-KEEPER'S GUIDE.

This 16th and latest edition of Prof. Cook's magnificent book of 460 pages, in neat and substantial cloth binding, we propose to GIVE AWAY to our present subscribers, for the work of getting NEW subscribers to the American Bee Journal.

Given for TWO New Subscribers.

The following offer is made to PRESENT subscribers only, and no premium is also given to the two NEW subscribers—simply the Bee Journal for one year:

Send us TWO NEW SUBSCRIBERS to the Bee Journal (with \$2.00), and we will mail you a copy of Prof. Cook's book FREE as a premium. Prof. Cook's book alone sent for \$1.25, or we club it with the Bee Journal for a year—both for only \$1.75. But surely anybody can get only TWO NEW SUBSCRIBERS to the Bee Journal for a year, and thus get the book as a premium. Let every body try for it. Will YOU have one?

GEORGE W. YORK & CO.,

144 & 146 Erie Street, CHICAGO, ILL.

The Novelty Pocket-Knife.

Your Name and Address on one side—Three Bees on the other side.

(THIS CUT IS THE FULL SIZE OF THE KNIFE.)

Your Name on the Knife.—When ordering, be sure to say just what name and address you wish put on the Knife.

The Novelty Knife is indeed a novelty. The novelty lies in the handle. It is made beautifully of indestructible celluloid, which is as transparent as glass. Underneath the celluloid, on one side of the handle is placed the name and residence of the subscriber, and on the other side pictures of a Queen, Drone, and Worker, as shown here.

The Material entering into this celebrated knife is of the very best quality; the blades are hand-forged out of the very best English razor-steel, and we warrant every blade. The bolsters are made of German silver, and will never rust or corrode. The rivets are hardened German silver wire; the linings are plate brass; the back springs of Sheffield spring-steel, and the finish of the handle as described above. It will last a lifetime, with proper usage.

Why Own the Novelty Knife? In case a good knife is lost, the chances are the owner will never recover it; but if the "Novelty" is lost, having name and address of owner, the finder will return it; otherwise to try to destroy the name and address, would destroy the knife. If traveling, and you meet with a serious accident, and are so fortunate as to have one of the "Novelties," your Pocket-Knife will serve as an identifier; and in case of death, your relatives will at once be notified of the accident.

How appropriate this knife is for a present! What more lasting memento could a mother give to a son, a wife to a husband, a sister to a brother, or a lady to a gentleman, the knife having the name of the recipient on one side?

The accompanying cut gives a faint idea, but cannot fully convey an exact representation of this beautiful knife, as the "Novelty" must be seen to be appreciated.

How to Get this Valuable Knife.—We send it postpaid for \$1.25, or give it as a Premium to the one sending us THREE NEW SUBSCRIBERS to the Bee Journal (with \$3.00). We will club the Novelty Knife and the Bee Journal for one year, both for \$1.90.

GEORGE W. YORK & CO.

St., Chicago, Ill.

*Please allow about two weeks for your knife order to be filled.

ESTABLISHED IN 1861 AMERICAN THE OLDEST BEE-PAPER IN AMERICA BEE JOURNAL

41st YEAR.

CHICAGO, ILL., OCTOBER 31, 1901.

No. 44.

* Editorial. *

National Association Elections are held annually in December, that is, the election of general manager and the successors to three members of the board of directors, whose terms expire with the end of each year. The executive committee (composed of the president, vice-president and secretary) are elected at the annual meeting of the organization.

Referring to this subject, though more particularly to nominations in advance of the election, Editor Hutchinson said this in the Bee-Keepers' Review:

Nominations in advance of the election of a general manager, and the directors of the National Bee-Keepers' Association, would be very desirable. As it is now, when a member receives a voting-blank, he does not know for whom any other member will vote. In his desperation he votes for the man whose term of office is about to expire. As a result, each officer succeeds himself, year after year. Should it ever become desirable to elect a new man, it would be well-nigh impossible with the present system. This question was discussed by the directors, present at Buffalo, but they were unable to devise a plan that seemed wholly satisfactory, and it was finally decided to have the matter taken up in the bee-journals for discussion.

The foregoing was sent to E. R. Root, one of the directors, for his criticisms or suggestions. He considered it brief and to the point, and passed it on to Bro. Abbott, who is chairman of the board of directors. He penciled on the back of the sheet the following:

"While it is desirable to keep the same parties in office as long as they attend to business, and give satisfaction, yet it is important not to have too many directors in one locality, and to place in office men who will attend the annual meeting as often as possible."

The suggestion that we put in directors and a general manager who will attend the annual conventions as often as possible, is worthy of consideration. At the Buffalo convention six of the directors were present, one more would have given us a quorum, and we did more business than could have been transacted in weeks or months of correspondence. There is nothing like a face to face discussion of a knotty question. Other things being equal, we should give our preference to those men who are usually present at the annual convention.

This is a matter that we fear will never be satisfactorily arranged. To nominate a certain man (or men) in the bee-papers in advance of the election will hardly do. Who will name them? How many nominations are there to be? Suppose a hundred members nominate as many different candidates, what is to be done?

We noticed last year that some of those

whose terms of office did not expire at that time received quite a number of votes. This, of course, was useless. It might be well to print the list of holdover directors, and above them put this:

"Don't vote for any of the following, as their terms of office do not expire this year."

Nothing need be said about those whose terms do expire—not even mentioning their names; then let the members vote for whom they please.

It might not be a bad idea for each annual convention to nominate three candidates for general manager, and nine candidates to succeed the three whose terms expire with the following December. Then these nominations could be announced to the members when sending out the voting blanks. Of course, any others could be voted for if preferred, but very likely one of the three would be elected general manager, and three of the nine would be elected directors.

We commend the foregoing suggestion to the consideration of the membership of the Association, to be acted upon next year, if thought best. Of course it is too late to make use of it this year. The old method will likely have to prevail once more.

We feel perfectly free to speak out on this subject, as we are not now an officer, nor are we seeking any office in the Association, believing that the more prominent and wiser ones should manage its important affairs.

Long Tongues Per Se.—In the Bee-Keepers' Review for September, F. B. Simpson disclaims the intention of teaching that long tongues are of no value *per se*. It was said on page 451 of this journal that it was doubtful if he meant to teach just that thing. But his words—"I believe the long tongues are of no value only so far as they represent an increase of vigor"—*seem* to teach just that thing, at least a *Straw* in Gleanings in Bee-Culture, and an "Afterthought" in this journal, show that others so understood. But a man who is doing as good work as Mr. Simpson may easily be forgiven for failing in a single case to make himself rightly understood.

Deficiencies of Bee-Books—Every now and again the novice makes the charge against his text-book that it lacks the very thing he most wants to know. The text-book on bee-culture that is perfect is yet to be written, and the probability is that it will never be written. Yet it is doubtful that more truth about bee-keeping could well be gotten into the same space. It must be remembered that no matter how full and complete a bee-book may be within the limit of a

certain number of pages, there can not of necessity be full minutiae upon all points that may arise. New complications will always be arising that will raise questions which can only be answered by some one of experience, and for the very purpose of answering such questions a department in the American Bee Journal and in some other journals is constantly maintained. The readers of this journal need never hesitate to make free use of the department of "Questions and Answers." Especially are questions allowed, and even solicited, from our regular subscribers who have made careful study of the text-books.

Study carefully your text-book, and become familiar with it; for the question department is not intended to take the place of the text-book, and after you are familiar with the contents of any good work on bee-culture, you will ask intelligently questions whose answers will be useful to many others. But don't ask too much of the text-books, and don't expect a study of them ever to leave you without some question that needs answering.

Warning Combs.—When Wm. McEvoy gives additional combs of honey in the spring, he takes the precaution to have these combs warmed before being put in the hive, by keeping them in a *very warm* room until they are warmed clear through, as he relates in the Bee-Keepers' Review. If one stops to think, this will appear a rational proceeding. The combs in the hive, whether full or empty, will be of about the same temperature as the cluster of bees, so far as the combs are included in the cluster or touching the sides of cluster. Now suppose the cluster is divided to receive a fresh comb of honey, or even if it be placed close up against the cluster, it is easy to see that the bees would be thereby chilled, and perhaps serious damage done. Mr. McEvoy is doing a wise and paying thing to warn the combs that he gives. Of course these combs are given in the evening, and then there will be little fear of robbing.

Hairy Vetch was mentioned on page 611 as a possible new honey-plant. Mr. M. M. Baldridge, of Kane Co., Ill., called recently and brought with him a sample of the vetch, which was still in bloom. It is a sort of trailing or vine-like plant, growing as much as four feet in length, and has long, purple flowers. He has not seen a bee on the bloom, so is inclined to doubt its value as a honey-plant in his locality.

Mr. Baldridge says the vetch is the same plant as tares referred to in the Bible as having been sown among the wheat by the Evil One. It is almost impossible to separate the

tures (vetch) from the wheat without destroying the latter.

Vetch is usually sown with timothy or some other tall-growing plant which aids it to stand up.

If any of our readers know vetch to be a netter-yielder in their locality, we should be pleased to have it reported; also time of sowing, and how to grow it successfully.

Introducing Queens with Tobacco. Editor Hutchinson says, has resulted in occasional failures, and he adds: "I am beginning to think that we will never find an infallible method. There will always be some bunglers in the ranks."

Weekly Budget.

MR. R. A. HENDERSON'S APIARY is shown on our first page this week. He is in this (Cook) county. He began last spring with 11 colonies, and he says: "With the American Bee Journal and 'A B C of Bee-Culture' as my guide, I increased to 45 colonies, by rearing and buying queens; and took off 1500 nice, finished sections." Mr. Henderson succeeds because he puts sense and enthusiasm into his work with bees. Of course, his good location makes up the rest, as nothing else could replace the lack of that.

MR. A. L. BOYDEN, of the A. I. Root Co., is soon to visit the West Indies—Barbados, Jamaica, Cuba, Trinidad, etc. Also Rambler (John H. Martin) is to "trip it" through Cuba with bicycle, camera, etc. There is no more enterprising concern on the continent than the publishers of *Gleanings in Bee-Culture*. And that elegant periodical shows the wonderful amount of work and expense constantly bestowed upon it. It richly deserves all the success with which it is meeting these autumnal days.

MRS. CLARA WEST EVANS, one of the subscribers of the American Bee Journal, has been nominated as a candidate for superintendent of schools for Althamake Co., Iowa. The local newspaper, where she lives, besides giving an excellent picture of the nominee, has this to say among other endorsements:

"Mrs. Evans has the health, energy and ability which fit her for the duties of superintendent of schools, and if elected would do her best to meet the requirements of that office. As a business woman she is thorough, honest and reliable. After the death of her husband, three years ago, she assumed the management of his business, and by reason of study and close application, ranks to-day as one of the most successful apiculturists in the State of Iowa. She has held various offices of trust and responsibility in church and lodge wherever residing."

Some people don't believe in women going into politics. Neither do we in the kind of politics most in evidence to-day. But some day politics will be cleaner. It would be cleaner now if only men and women of the stamp of Mrs. Evans were allowed to have official power. What is needed is less politics and more manhood and womanhood in our officials—less party blindness and more righteousness in the voters.

The Buffalo Convention.

Report of the Proceedings of the Thirty-Second Annual Convention of the National Bee-Keepers' Association, held at Buffalo, New York, Sept. 10, 11 and 12, 1901.

(Continued from page 680.)

FUMIGATING COMBS WITH BISULPHIDE OF CARBON.

"How soon may combs that have been fumigated with bisulphide of carbon be given to bees without killing the bees?"

Mr. Benton—I have frequently used bisulphide of carbon and used the combs an hour after that; but if you put a whole colony of bees in, there would be a chance of killing the bees. I don't think there is any danger in a few hours. It evaporates very rapidly.

Mr. Abbott—I don't think that bisulphide of carbon would affect anything in 3 minutes after if it is not confined. Bisulphide of carbon won't affect anything if it is not confined, and you can pour all the bisulphide you please on a comb in the open air and it will all be gone in three minutes, and I don't see how you could kill the bees without it being confined.

Mr. Benton—The odor would be disagreeable; I don't think it would kill them.

Mr. Abbott—I use it for keeping the moth from eating up the paste that I paste my papers with. I pour a little in a saucer and in a few minutes the moths are all killed. I do not hesitate to open the can and breathe it, but if it was confined I wouldn't want to stay there.

Dr. Miller—I would like to ask this question: Does bisulphide of carbon kill the eggs of the bee-moth?

Mr. Benton—I think it does. I never have had them develop in combs that were thoroughly subjected to bisulphide of carbon. I would stack up eight or ten hives and put half a pint of bisulphide in there and let it stand several days; some of those combs that had stood two or three months in hot weather; there were eggs there I know because other combs developed.

Dr. Mason—I had some extracting-combs that I noticed the worms working in, and I piled them up and put a teaspoonful of bisulphide of carbon in a dish on top of the frames, and in two or three days when I examined them there wasn't a sign of any worms but dead ones.

Dr. Miller—We have been using sulphur, and now we are told bisulphide of carbon is better, and we want to know about how much better. Now, in using sulphur, if the combs have in them the larvae of the bee-moth, I wish Mr. Benton would tell us a single word that we can use. At any rate, these worms, when they have attained any size—say if they are half an inch or an inch long—you may sulphur them so thoroughly that you will have everything green, and those big fellows will still be alive and happy after they come

out again. Now, will the bisulphide kill those old chaps?

Dr. Mason—It will kill every one of them, every time. I overlooked a hive this summer that had wormy combs in it, and when I discovered it they were great big fellows, and in an hour's time after using the bisulphide every one of them was dead.

Mr. Barb—I would like to ask Mr. Benton whether he applies that bisulphide above or below.

Mr. Benton—On the top, because it is heavier than the atmosphere. I put an empty super there and set a little tin can in there—perhaps half a pint, or teacupful, for quite a stack of hives.

Mr. Abbott—Did I understand Dr. Miller to say that sulphur gas will not kill the big worms? I have never seen anything that I could not kill by sulphur gas. Seriously, I think you are laying down a proposition that seems to be contrary to all scientific investigation. If there is anything that breathes that can live in sulphur gas, I have yet to see it. I used to be in the patent medicine business, and we had a vat in which if you had hung anything from an elephant down to a mosquito it would kill it.

Dr. Miller—I don't know of any way to get it sufficiently strong by ordinary means.

Mr. Case—My business down in Ontario County a few years ago was raising hops. I found a colony of bees one time, when I was drying hops, that the worms had destroyed, and I says, "Now I have a chance to fix you." So I took the combs that were a mass of worms, and put them into a small sack and put them into that kiln which was perhaps 20 feet square, where we burn all the way from 25 to 50 pounds of brimstone in about three or four hours, and I took pains to hang them on the wall with a stick so that I could get them up as near as possible to the ceiling to get the benefit of the brimstone; and I left them there all night and burned the brimstone myself, and when I took them out in the morning the worms were alive.

Mr. Abbott—Was that kiln air-tight?

Mr. Case—There is ventilation at the bottom, but the air is full of brimstone.

Mr. Hutchinson—Has any one used gasoline for killing moth-larvæ?

Pres. Root—We have used it for killing ants. We made holes in the nests and poured gasoline in instead of bisulphide of carbon to kill ants.

Dr. Miller—The statement was made in an obscure (?) journal. (I think it is called *Gleanings*), the statement was made that it had been used to kill the larvae of the bee-moth, and in connection with that the editor stated that he had used it to kill ants.

Dr. Mason—Will the sulphur fumes kill the eggs?

Dr. Miller—No, sir.

Dr. Mason—Well, the bisulphide will, and there is no sense in using sulphur when you can get the bisulphide. Now I pile up the hives as high as I can reach, eight or nine. I don't think I poured over two teaspoonfuls in, and it killed every worm.

W. J. Craig, of Ontario—I have been making some experiments with the bisulphide, and have piled the hives up in the same way, but I found that the eggs developed into a grub inside of a week, while it killed the larger larvae. At the same time, when I used the drug in an air-tight vessel it killed the grubs and destroyed the vitality of the eggs as well, but with piling the hives up I find that only the grubs were destroyed.

Mr. Benton—Of course, it would be better to be absolutely air-tight.

Mr. Craig—I am sure that I used two ounces of the liquid to ten supers, and I put it top and bottom.

Pres. Root—Then you probably had only an ounce on the top, if you divided the amount. That would hardly be sufficient, would it, Mr. Benton?

Mr. Benton—I think it would be, if of good quality.

Pres. Root—We have found a good deal of difference in the quality of the bisulphide. Sometimes we have had it good and sometimes bad.

Mr. Benton—I would like to state that it is extremely explosive, and if this were used in a room one should never go into the room with a lighted lamp, or candle, or pipe, or any fire whatever. It is to be handled with great caution. I called attention to it in a publication of the Department of Agriculture about five or six years ago. I would like to know whether it had been mentioned before for this purpose.

Pres. Root—I don't remember seeing any mention of it.

On motion the convention adjourned until 9 a. m. the next day.

SECOND DAY—WEDNESDAY FORENOON.

The meeting was called to order by Pres. Root at 9 o'clock.

ANNUAL PROCEEDINGS IN PAMPHLET FORM.

"Should the proceedings of the National Bee-keepers' Association be published annually in pamphlet form for distribution to its members?"

Mr. Hershiser—I feel very much interested in the work of the Association and the extension of its membership, for the reason that in order to carry out its aims it is necessary to have a fat treasury, and be able to have funds on hand to use when necessity requires. In order to get members it is necessary to show them that they get something. Almost everybody when approached to join an association like this, the question immediately occurs to them, What is there in it for me? Now, there are a great many bee-keepers in the country districts that should be members of the Association, but they are not members simply because they do not see that they are going to get anything out of it. They don't expect to be prosecuted for keeping bees. The chances are very remote for people living in country districts to be prosecuted; it is only in the case of

some difficulty arising between neighbors. Now, if you can show a bee-keeper that he is going to get something out of it, it is very much easier to get him to join the Association; and anticipating that these proceedings might be published in pamphlet form, I have induced seven or eight people to join the Association with the idea that they were going to get something valuable. A discussion of these questions of bee-keeping by the different bee-keepers from the different parts of the country are very valuable if the bee-keepers can get them. I think that it would be a good idea to have these proceedings published in pamphlet form, and every member to get a copy, and, if that is the case, I think that that is the best means of extending the membership and making the Association strong, and getting the two or three thousand members that so many of us ardently desire.

Franklin Wilcox, of Wisconsin—I in addition to what has just been said, I might say that I think that every member of the Association that pays his dues is entitled to a knowledge of all the proceedings of the Association. He should have it in some form. The question as to whether it should be published in pamphlet form is the question in my mind. If it is published, as heretofore, in the American Bee Journal, or any other journal, and each member of the Association furnished with a copy of that journal, whether a subscriber or not, it covers all the requirements, in my mind, and would save some expense. The expense of publishing it in pamphlet form is the only objection.

Mr. Hershiser—I would say in answer to the question of expense, that it is for that reason we want to go to the expense. If it is profitable to go to the expense, then we want to go to that expense.

Pres. Root—As I understand, the American Bee Journal containing the copy of the report has heretofore been sent to every member.

Mr. Wilcox—That covers all the requirements, as far as I can see.

C. J. Baldridge, of New York—Last year I didn't get the American Bee Journal.

George W. York, of Illinois—I think last year I offered to send all the copies of the American Bee Journal containing the report upon receipt of 10 cents. Perhaps some of the members didn't get notice of it.

Mr. McEvoy—I think that would cover all—ten cents—and have it published in the American Bee Journal; and those who aren't members could get it for 10 cents.

Mr. York—I had no idea when I made the offer that the proceedings would run through so many numbers. I wouldn't care to make such an agreement again. I might say that I agree with Mr. Hershiser, that it ought to be published in pamphlet form, and I know that the expense would not be any more than the Association could stand. It is much nicer to have a pamphlet with the proceedings to hand to a new member, than to try to get copies of a bee-paper with the report. For instance, six months from now, if you had this report in pamphlet form, the secretary could mail a copy to a new member. I think that the proceedings published alone, as they were

published after the World's Fair convention in 1893, would be much more satisfactory. I think it would be for the best interest of the Association to get it out in pamphlet form, and have extra copies so that every new member could receive one during the year. You then have something to offer to new members, otherwise you have simply nothing until they get into trouble, or see that they are helping the general cause of bee-keeping by paying their dollars.

Pres. Root—Of course, you understand that this discussion is advisory for the Board of Directors.

Dr. Mason—I may say that heretofore the Association has shared the expense of the stenographer with the American Bee Journal, but at the Philadelphia convention the bill was paid by Mr. York alone, and this year also he pays the stenographer. If the Association expects to get any of it outside of what he puts in the American Bee Journal, I suppose the members will have to pay for it.

Mr. Abbott—I wanted to say that I have felt all the time that we were making a blunder by not publishing the reports in pamphlet form independent of the American Bee Journal. I believe that such reports give tone and character to a society. I have felt all the time as though we were a kind of Cheap John affair, simply because we trusted to the papers to circulate our literature, as though we were not able to stand alone. I have intimated as much to the general manager, but he and some of the Board of Directors seem to think that a Cheap John arrangement is just as good as any other arrangement. There are some bee-keepers who are keeping bees according to the old methods that prevailed 50 years ago, and 50 years ago we would not have needed any report of that kind in order to promulgate our interests, but the time has come now when we need a report, bound and separate, independent and distinct from any paper, any journal or anything else, and as a newspaper man I know that there can be enough advertising put in the back of the pamphlet, if necessary, to pay for issuing the pamphlet; in fact, I am not so sure but I can find an advertising solicitor who will undertake to issue the pamphlet for the sake of the advertising that he can get in it. I understand that we are near the thousand mark in membership, and we are going to pass it at this convention, and if you have not given your dollar to help pass this thousand mark, we would be glad to have you do it now. I am glad that this matter has been brought up. We can get character and influence outside of the bee-keeping fraternity by having a thing of this kind. For instance, a man down in Kansas City is adulterating honey. I want to sit down and write to him with regard to it. I say to him: "Dear Mr. Smith, I mail you today under another cover a copy of the proceedings of the last National Bee-keepers' Association. It includes the names of officers, and the constitution, and explains our aim and purpose, and shows what we are trying to do. Now, we don't want to make any warfare on your business, but you will notice that we are a thousand strong, and unless you stop your adulterating we shall have to bring the law to bear

on you." A business man sometimes is known by a letter-head. If I get a letter from a business house on a Cheap John piece of paper I generally chuck it into the fire and pay no attention to it. But if I get a neat letter, printed nicely, on good paper, written in a business way, I say, "There is a firm that stands for something," and I write to them. These things tell in the world, and we want to use the things that are used by other business men. The spending of a few dollars for a report will do more, in my opinion, to help the bee-keepers of the United States than anything else we can possibly do.

Dr. Miller—I am convinced by some of the arguments presented now, as well as some other things, that the use of such a report might be an excellent investment; that, even if it does cost something, it will bring in more than goes out, and on that same line I endorse the thought that we don't want it on the Cheap John line. We have taken in the money and can get out a clean report. I believe if we are going to go on the dignity order, we would better keep it clear of everything but the reason.

Dr. Mason—Mr. York informs me that a thousand copies of the proceedings can be published in pamphlet form, and a copy mailed to each member, for \$100.

N. D. West, of New York—If we get the pamphlets printed, would it not be a good plan to have more printed than our membership, so that others could obtain them for a certain stated price, the amount to be thrown into the treasury to help maintain this organization? And notwithstanding the report is printed in pamphlet form, we would expect it and want it in the American Bee Journal just the same. In regard to the advertising in the back part of the book, I do not see that that would materially injure our pamphlet, if it was gotten up in a neat and attractive shape. It is necessary for us to save all the expense we can in regard to these things, and yet we do not want to do anything that would be any injury or injustice to the pamphlet itself; but there are a great many not here today that would like a pamphlet that belong to this Association, and which might be an encouragement to get others to join the Association later on.

Mr. Hershisser—I move that this convention request the Board of Directors to print the proceedings of this convention in pamphlet form, and to issue a sufficient number to supply each member with a copy, and such additional number as they may think best.

Dr. Miller—I second that motion.

The motion was carried.

Dr. Lee H. Smith, President of the Buffalo Society of Natural Sciences, was then introduced to the convention, and gave the following address of welcome:

Dr. Smith's Address of Welcome.

Mr. President, Ladies and Gentlemen—I trust you will continue to remember me as plain Smith, not the one who adulterates honey, but the one who is doing all he can for the advancement of information and of science in the city of Buffalo. It was with very great pleasure that we received information from the National Bee-Keepers' Association that they would meet in

Buffalo, as we desired very much to entertain this organization, and hence we wish to state to you that these rooms are yours during your stay here. We have this meeting room, and also several other rooms in connection therewith, in which your directors and committees may meet, and, of course, anything that we can do to render your stay here agreeable and pleasant we will be very happy to do.

Nearly 20 years ago the citizens of Buffalo subscribed nearly three quarters of a million of dollars for the erection of this building. It was to be the home of the Public Library, of the Academy of Arts, of the Historical Society, and of the Society of Natural Sciences. Since then the Fine Arts have outgrown the limits of the building, and a public-spirited citizen of Buffalo, Mr. Albright, has provided them with a very beautiful building, which you will notice as you enter the Pan-American grounds. This will be the headquarters of the Fine Arts. Their place in this building has been taken by the Public Library, which was formerly supported entirely by private subscription and membership, but within the last ten years it has grown so great that the city has fathered it, and now devotes nearly \$75,000 per year for its maintenance. The ground upon which this building stands was donated by the city.

Of course, this is simply an idea of what the spirit of the citizens of Buffalo is in regard to educational and scientific work. Everything is being done by the city that they can to favor and further the work of such organizations as this. The presence of the bee-keepers is simply another step in the interest that is felt in this city in the subject of bees. Nearly ten years ago one of our most lovely members, the Hon. David F. Day, a man of great learning and of ability, a botanist, perhaps without equal in the United States and in the world, suggested that it would be a very interesting and valuable thing if the subject of the honey-bee could be brought more nearly to the understanding of the public. The matter was canvassed by the board of directors of the Society of Natural Sciences, and it was thought that possibly the general public was too busy with other affairs, and had lost interest in such matters, and that it would be better to begin with the young. After considerable consideration, the question of giving an exhibition, in these rooms, of the honey-bee, to the children of the advanced grades in the public schools was taken up. The Society made the offer to the Superintendent of Education, and to the Board of Education, and it was very agreeable to them.

We had long known Mr. Sleeper, who was familiar with the bee from A to Z. I entered into correspondence with him, suggesting that he bring here some bees and give a public demonstration to these children of the different classes, answer questions, and give them an idea of the interest, the usefulness and the wonderful instinct of the honey-bee. Mr. Sleeper very kindly accepted this invitation, and came on here in winter and these rooms were thronged with the pupils of the public schools in the 8th and 9th grades, with special classes from the high school, and with classes from the

various private schools. At that time we had in the city also a school of pedagogy in which advanced teachers were given courses. This school also came down here and went over the exhibit very carefully. The result was a profound success of the enterprise. I don't think that any departure made by the Society of Natural Sciences brought it more valuable returns in the way of interest of the public in its work. We extended that system of teaching to other departments. We sent, for instance, collections of Indian relics, of animals, of birds. We have classes here from the schools that meet to study birds. But it began with the honey-bee. It was a case where the sting of the bee opened the ball, and our department in this line is the most successful of the branches of the Society of Natural Sciences.

Mr. Sleeper, I may say, almost made himself a martyr to this cause of science, in that one of the very coldest days he was due here to lecture at the rooms, and in getting his bees to the station and in getting them in here he was taken with pneumonia, and lay at death's door for some time. It was a matter of very serious sorrow to us all, and we had then to call upon Mr. Hershisser, who very kindly offered to continue the course of lectures, owing to the illness of Mr. Sleeper. This department will steadily be continued.

You see, therefore, that we owe a great debt to the bee-keepers, and in inviting you among us, and being able to offer you some little entertainment—a place to meet, or some few little things—we can, in some measure, give you an idea of the debt of gratitude we owe to the bee-keepers. I have also given you a little suggestion of what is being done here in regard to the study of the honey-bee, of what great interest the study of this subject is to the general public, and I hope to see the time when every school shall have in its course a study of the honey-bee, with a practical demonstration. It is a wonderful creature and the subject is fraught with the greatest scientific interest in all its departments.

The diseases of the honey-bee are something that every scientist views with the greatest interest, and you gentlemen with practical knowledge of those subjects can do so much to advance the scientific inquiry in regard to the diseases that are common to the lower orders of insect life. Of course, the same general line of diseases that kill the honey-bee kill many of the insects that are destructive to vegetation, and a whole world of inquiry is opened up by the study of this one little insect whose cunning is so marvellous.

I wish to thank you most kindly for your attention, and again I wish to welcome you most heartily to our rooms.

(Continued next week.)

Requeening Every Year is coming more in favor all the time with Adrian Getz (Bee-Keepers' Review), although bee-keepers quite commonly prefer to leave to the bees the task of requeening. With young queens he has fewer drones and less swarming. But some will object that annual requeening gives less chance for thorough establishment of a reputation for queens to breed from.

Contributed Articles.

No. 1.—APICULTURE AS A BUSINESS.

Plant-Growth Conditions in the Arid and Irrigated Regions.

BY R. C. AIKIN.

FOR two years the general honey crop has been rather limited. The great forage-plant of the West—alfalfa—is not much grown outside of the irrigated districts. Drouths and other causes have worked against the main source of the East—white clover—and the Eastern short crop has made a demand for honey from the irrigated districts.

I observe that the people are prone to jump at conclusions, both in general and in particular; and, regarding honey-production and apiculture as a source of a living income, an analytical discussion dealing with facts and figures touching the industry as a business seems timely and much needed. Among the things that lead me to this discussion, are the rash ventures made by inexperienced ones going into the business without due investigation and consideration. But, how are we to reach these people? My thoughts through bee-paper channels will entirely miss the most of these rash enthusiasts, for they do not read such literature, many of them possibly but little of any kind, especially of a scientific nature. However, many now in the business more or less, and who do read our literature, some who are planning to extend their business, or, perhaps, to change locations, may be benefitted by a discussion such as I am about to undertake.

ALFALFA.

Two things that need to be understood better are sources of honey and the dependence to be placed in them. There is a prevailing opinion throughout the East—many Westerners share in it—that the two main sources of the irrigated districts—alfalfa and sweet clover—are a certain supply, never failing. This is one of the things that must be considered in the business calculations. If an annual yield of a given number of pounds per colony can be obtained, we have somewhat to build upon.

When I came to this place the farmers here were making an effort to grow red clover, and many fields of it were to be found all over this district, although alfalfa was the main hay crop. Two years I obtained quite a crop of red clover honey, then the clover ceased to exist. So far as soil is concerned, any and all the clovers do exceedingly well. I have never seen anywhere such immense growth and bloom on white clover as I have seen here; but while this is decidedly a clover soil, white and red clover will never succeed in general. Our climate is so dry—so many months in the late summer, fall and winter without sufficient rain to keep the ground moist—that the clovers do not get started, or, if started, are soon killed out by drouth. Irrigating water begins to get scarce in August, and in September and October we can scarcely get any. Just now—October—there is but a very limited water supply. I get many inquiries from the East about our country—this answers many.

In winter and spring—particularly late winter and early spring—is when most of the snows fall upon the mountains. When they are having their greatest precipitation in the Missouri and Mississippi valleys, we are having ours, too, but ours mostly falls upon the mountains. The general trend of air currents is from west to east, and the high, cold mountain tops condense and precipitate moisture from the Pacific; thus the moisture is, as it were, strained out of the air before it gets to us, hence the country at and near the mountains on the east is a dry one.

Beginning at the "foot-hills" (first hills of the mountains, as I use distances on a magnificent scale), is the dry or arid region. This arid region continues arid, but gradually changing to one of more humidity as distance increases from the mountains, until when the Missouri valley is reached, 400 to 600 miles from the mountains, the rainfall becomes sufficient to make farming a reasonable success. Precipitation varies as air currents vary because of high or low mountains and other physical arrangements of the country.

The reader will comprehend that in the spring, as the weather begins to warm, the accumulated snows begin to melt and flow out of the mountains; but keep in mind the great altitude of the "Rockies" and you will understand that spring up there is late. Comparatively little water gets down before April, the greater part coming in May and June. We depend upon spring rains to start the crops growing, and, by the time they are started, melting snows above bring water for irrigating. There are other reasons, however, for starting crops without irrigation, but not necessary to discuss them here.

Remembering, then, that there is but little water to apply to the soil in early spring, rather from early fall till late spring, you will see how almost an impossibility it is for white and red clover, or any shallow-rooting plant, to live here. The red clover fields planted here 10 to 12 years ago soon winter-killed, *simply and purely for lack of moisture*. Only such as send long, thick tap-roots deep into the ground, and such plants as by nature are fitted to withstand drouth, these only can survive here. As an illustration, buffalo grass will become almost *perfectly* dried, yet retains vitality and responds when moisture comes again.

These conditions necessarily limit our flora to such plants as are peculiar to arid districts, and the principal of these, aside from the California region, are alfalfa, sweet clover, and cleome. The former is grown of necessity, because timothy, clover and ordinary hay and pasture grasses cannot be grown here. Sweet clover is just in its element of soil and climate here, and while an unwelcome addition so far as the farmer is concerned, yet it flourishes along ditches, roadsides and everywhere where there is plenty of moisture, if it is not cultivated out. While sweet clover endures much dry weather when once started, it is not by nature an arid-region plant. It grows most luxuriously by ditches and water-courses, and around the edges of swampy lands. Because the alkaline soil is its natural soil, and its long tap-root can reach deep to moisture, it makes quite a growth in quite dry soils, though depending upon rains to start the new plants. It is a biennial. Alfalfa is of the same nature as sweet clover, but will not stand quite so much moisture in the way of a wet, soggy soil. Alfalfa is a perennial, whereas the other clovers are more truly biennials, hence the former once established grows on and on indefinitely, roots becoming one to two inches thick, and 10 to 20 feet long, penetrating almost straight down. Alfalfa never reaches its best until about the third year.

Now, while in some localities there is more or less wild bloom that gives a surplus honey, so far as the irrigated regions are concerned as a whole, we have but three sources of honey—alfalfa, sweet clover, and cleome, in the order named. The first is now famed the world over, the second is a common and well-known plant in all beedom—so far as its reputation goes—and the third is probably confined to the mountain regions, including all arid districts. Cleome is decidedly an arid region plant, likes a sandy soil, and growing where neither alfalfa nor sweet clover will. Not one of these plants is absolutely sure as a honey-yielder. Each needs its peculiar conditions to make it succeed, both in making a growth, and in nectar-yielding. My own field has the three sources; first in importance is alfalfa, second sweet clover, and last cleome—this latter not in quantity to give a surplus with the great numbers of bees to work upon it.

As to conditions necessary for the plants, I will briefly give my opinion, but consider this only as an opinion, for I am not certain. Alfalfa needs to be well irrigated, and have a rich, healthy growth, then bright, hot weather while blooming. It does not yield well in the morning. Sweet clover is much the same as alfalfa, though to yield well I think it needs a more humid air, and probably less heat, showery weather seeming best. Cleome yields pollen in the morning, is visited by the bees before alfalfa is scarcely touched, and evidently does best with cool, moist weather. While cleome will grow almost from the dry, hard road, yet I believe it secretes best with rather cool weather and occasional showers. Not living in a region with abundance of cleome I am not so well qualified to speak of it.

I have harvested much alfalfa, also quite freely of sweet clover, and a little cleome. Because of irrigation keeping some fields of alfalfa in *prime* condition every year, we seldom fail to get more or less honey from it; but that it yields a *paying* crop every year is not true. In 12 years I have not taken at most more than six fair to good crops, and of these, generally speaking, I may say two were alfalfa, two red clover and two sweet clover. But, while two were almost exclusively alfalfa, four were mainly so,

and all were more or less mixed. Two seasons, if sweet clover had not come to my aid, my crop would have been a failure. Three and four years ago sweet clover gave me my surplus, while this year and last alfalfa was almost the entire crop, sweet clover growing in abundance but almost a complete failure so far as nectar was concerned.

These things are facts and conditions to be considered in our business calculations, hence I discuss them in this initial article on apiculture as a business. The irrigated regions are more certain to have *some* honey every year, but what is an abundant or partial crop and no income from it?

We will continue the business aspect of apiculture.

Larimer Co., Colo.

Introducing Queen-Bees by the Improved Method.

BY W. W. M'NEAL.

It devolves upon me to write further of the method of introducing queen-bees, recently submitted for the benefit of the readers of the American Bee Journal, and which was referred to Wm. M. Whitney.

I wish to say that I have no ill feelings whatever towards my opponent; neither is it love for discussion that brings me before this intelligent audience of bee-keepers. In taking up the subject again I do so because there is a *practical* principle involved which honey-producers cannot afford to ignore.

Mr. Whitney now professes to be very much surprised (see page 653) that I should take seriously his statements antagonizing one of the grandest truths which have been given to the bee-keeping world. If he *knew* the position he took was not "tenable," then what motive had Mr. Whitney in taking the position at all? If the assertion be true—"love, hatred, generosity, and selfishness" are unknown qualities in the make-up of the honey-bee, how does Mr. W. harmonize this with his former statement that the honey-bee is "prompted by the highest type... of love and patriotism?"

This, however, is not the point directly at issue and I must not linger here. I did not "take seriously" the words of my esteemed fellow bee-keeper, though it seems that he is pleased to place a lower estimate upon his writings than I was wont to accord him.

Now, what I specially wish to ask of Mr. Whitney, and all who are interested in apiculture, is to try the method I give you for the safe and practical means of introducing a queen-bee. In the name of progress, I ask of you, at least, to try the plan and see if it is not good.

I have tested it and find that I can introduce a queen-bee safely into any colony where a queen-bee can be introduced by any other method; and, in many instances, more successfully than by any plan of caging. I know others can do what I have done if they pursue the same course. One does not need to be an "expert" in fact, the system is pre-eminently adapted to the "beginner." The fact that these teachings are not recorded in the pages of any of the recognized works on bee-culture does not signify that they should not be there.

I hope no one of the readers of the American Bee Journal is so impractical as not to be able to recognize a good thing till it is written in some text-book.

Instead of throwing cold water on a principle that has real merit, why doesn't Mr. Whitney come out and do the proper thing and advise those beginners against the folly of purchasing such valuable queens as he seems to have in mind? What use has a beginner with a queen so valuable that he cannot make use of her?

Consider the rapidity with which queens may be exchanged, and the time thus gained, when time means honey, eventually stored by bees reared from eggs laid by the queen during the interval the advocate of the caging method would have her confined in a cage!

When the queen of a strong colony is taken away and introduced into another by caging her, I believe that it will be safe to say that a week's time will be required for the queen to reach her former proficiency in egg-laying. Now, all this causes the new queen to appear at her worst at the very time when she should be in her best physical condition. The colony thereby becomes impatient from the inability of the strange queen to fill the place of the one taken away, and shifts its hopes to the rapidly-developing larval queens; thus, in a measure, she becomes a prisoner awaiting execution by her younger rivals.

To show further the utility of immediate introduction of the queen, let me relate that I have found no difficulty in

thus introducing queens into colonies from which the old queen has not been removed. This is no "idle dream," and what I have done you can do.

Where a colony occupies two sets of combs, take the old queen and a frame or two of the brood and place them in the upper story over a queen-excluding honey-brood. Now close the hive and smoke the colony from the entrance while pounding lightly upon it to frighten the bees thoroughly. Do not use smoke enough to drive out the bees, but a moderate smoking while pounding on the hive frightens them so efficiently that the stranger queen may be allowed to run right into the hive from the entrance; and she will occupy the lower apartment as wholly as if the former queen had been removed.

These are facts, and I give them as freely as the air we breathe, because I want to help as I have been helped.

Suppose you do make one or two unsuccessful attempts, is that sufficient cause for you to cast the thought aside as being destructive to the best interests of both the bees and bee-keeper?

Let some should even yet not understand, I repeat in all simplicity: Have your stranger queen at hand when you take away the reigning one. Disturb the colony as little as possible while catching the old queen; when she is found, close the hive and smoke the colony from the entrance, pounding on the hive, of course, while doing this. Do not smoke the bees constantly, but smoke and pound alternately, for two or three minutes only; then allow the new queen to run into the hive by holding the cage up close to the entrance so that she may not escape in the air. Send a puff or two of smoke into the hive after her, but don't pound on the hive any more. The object is to frighten the bees as much, and the queen as little, as possible. See?

Next, be content to let a good job alone for a few days and do not disturb the colony. A frightened queen is almost certain to run up against her doom, be it in her own hive or in the midst of stranger bees.

I cannot continually call your attention to these living truths; so again I ask that they be tested upon the earliest opportunity; test them thoroughly, and I know that they will stand with you as they have stood with me.

Scioto Co., Ohio.

Questions and Answers.

CONDUCTED BY

DR. C. C. MILLER, Marengo, Ill.

(The Questions may be mailed to the Bee Journal office, or to Dr. Miller direct, when he will answer them here. Please do not ask the Doctor to send answers by mail.—EDITOR.)

Troubles of an Amateur—Uniting Colonies and Introducing Queens.

I have subscribed to the Bee Journal and invested in the "A B C of Bee Culture" in the hope of being able to answer my own questions, but, unfortunately, I find myself farther at sea than ever, from the fact that the experience of nearly every bee-keeper is directly at variance with that of every other, and even the directions given by the same apiarist contradict themselves constantly.

For instance, my first instructions were, "Keep your colonies strong;" so, having several small colonies, I concluded to look up "Uniting Bees." After getting some general directions, I came to "I would advise deferring the uniting of bees until we have several cold, rainy days in October;" but further on I find, "Beware of having weak colonies to be united in the fall. Much safer to have them all united long before winter comes." Now, which shall I do—"defer until winter," or "unite long before winter?"

Again, I intended to introduce an Italian queen, so I ordered one and got directions to "remove the old queen at least three days before introducing the new one." I did this, but the queen was killed. So I ordered another, and read that the proper way to introduce a queen was to "ret the old one out, thoroughly frighten the bees, and run in the new one before the bees know what has happened." I tried this, and also failed. Now, should you wait three days or not wait at all? The advocate of each plan says he has succeeded with 99 out of 100. I have failed twice out of twice.

The trouble with bee-books seems to be that either they tell everything except what you want to know, or they presuppose that you know all about it and merely want the book to see how much better we know it than the authors.

MISSISSIPPI.

ANSWER—I enjoyed your letter with a broad smile, and am thankful that you could not answer all your own questions. Yours seems such an intelligent sort of ignorance, if I may be allowed the expression, that it is a pleasure to answer your questions, and I may say to you that whenever you reach the point where you can answer all your own questions I have a whole lot that I'd like to have you answer. But it is to be a secret between you and me that I don't know all about bees.

Now I'll see what can be done toward reconciling the apparent contradictions that seem to trouble you. "Keep your colonies strong" is Oettl's golden rule, and if any one of the four words in it should be emphasized, it should probably be the first, making it read "Keep your colonies strong." Now, if you keep all colonies strong there will be no need of uniting at any time. But the best you can do will always be likely to have some colonies that are not strong. If you use the nucleus plan of building up colonies, of course they will be weak at the start, building up as the season progresses, and there will be some that fail to build up satisfactorily; some colonies will become queenless and weak; indeed, there are different ways in which good beekeepers may have, each year, colonies so weak that they should be united. But you must try to prevent having weak colonies late. "Beware of having weak colonies to be united in the fall." Better unite not later than August, while bees are gathering and not inclined to quarrel, and while brood-rearing and other work is going on, so that the united colonies will have plenty of time to be fully settled into one harmonious whole before cool weather comes. "Much safer to have them all united long before winter comes."

But through carelessness, ignorance, or, perhaps, for some entirely satisfactory reason, October may come and find you with some colonies so weak that they will stand a poor chance of getting through the winter. It doesn't do any good to say reproachfully that they ought to have been united in August. They were not united in August, and the question is what to do now. They are not gathering and so are inclined to be quarrelsome, and if united at a time when very active a good many may be killed. A few days' waiting will make no material difference, for everything is at a stand-still: so "I would advise deferring the uniting of bees until we have several cold, rainy days in October." Then the bees will be inclined to be somewhat dormant and little inclined to fight; and, besides, they will be more likely to cling to any new location without flying back to the place from which they were taken. Now, don't you think I have made a pretty good job of reconciling what seemed to you contradictions?

But when it comes to the matter of queen introduction, I'm afraid I can't satisfy you so well. All the different ways of introducing queens, with various modifications and adaptations, would make a book of itself; and constantly new plans are being given that are said to be infallible, which, upon further trial, are not found to be *always* successful. I know of only one way that may not fail one time in a hundred, or oftener. Take two or three combs of just emerging brood (no unsealed brood, which would only die of starvation), close them in a hive with the new queen, so that no strange bee can enter, keep the hive in a warm place if weather makes it necessary, and, after five or six days, open the hive on the stand which it is to occupy. You will see that there is no chance for the queen to be molested, for not a bee is present which has ever formed allegiance to any other queen, and, of course, every worker born in the hive will be loyal to the queen present. Other plans have their exceptions. You tried two plans, each of which had succeeded 99 times in a hundred, and in each case you happened on the one time in a hundred, or else there was some little thing in which you did not minutely follow out instructions. One plan may put the new queen in the hive at the time of removing the old one; another may leave the hive queenless several days; and one plan may be as successful as the other, providing the proper instructions for *each* are fully carried out.

It may be some comfort to you to know that you are not the only one who has made a failure. "There are others." But as you gain experience your failures will become less in number. Yet, unless you do better than I have done, you will fail occasionally in introducing a queen as long as you live.

* The Afterthought. *

The "Old Reliable" seen through New and Unreliable Glasses.
By E. E. HASTY, Sta. B Rural, Toledo, O.

LONG TONGUES AND LONGEVITY.

Having duly "banged" the long tongues, I begin to think we must choose some big gun and bang him against "longevity." "Pears like certain brethren approve the work of certain colonies in the yard and credit it to longevity, when they have never tried to *know* anything definite about it beyond their own imagination. Has any careful, scientific-minded brother ever published any set of experiments showing two side-and-side colonies as differing much in longevity? We may not find all bees rigidly alike in term of life, but at present there is too much possibility of it for such jumping at conclusions. Perhaps what is *usually* credited as short-livedness in a colony is really such a lack of constitutional health that a large percentage of the young bees emerge alive but worthless. Page 594.

MR. DADANT AN EXEMPLARY VACATIONIST.

For bee-keepers on vacation bent, C. P. Dadant is an excellent exemplar. Go to some nice town which has not been spoiled by tourists. Page 597.

EDITORS AND CORRESPONDENTS THAT "SPAT-TER."

And so our editors must not "spat" so much, but just follow Paddy W. T. S., and hit every head in sight. Page 598.

A PACE FOR GUESSEES.

Thank you, Comrade Miller, for setting a good pace in the matter of guesses. We don't agree to replace them with new ones in case they fail to give satisfaction. Page 602.

SETTING MULBERRY CUTTINGS IN JULY.

Mulberry cuttings to be set in July, Dr. Peiro says. Some of us so dull as to think that all cuttings should be set in the spring, of course. And we would make a total failure of it, very likely—and then scold the man who said mulberries could be raised easily from cuttings. Page 605.

A NEW "BEE-SOCIETY."

I'm afraid that the bee has a life-membership in the Got-your-name-up-and-lie-a-bed-till-noon Society—this in respect to accurate mathematics, and in respect to neatness, and possibly in respect to some other things. Page 605.

BEE-ESCAPE IN CORNER VS. CENTER.

I am no authority at all on bee-escapes, but my conjecture is that escape in corner is a great improvement on escape in the center of the board. With a quiet mass of bees above and below, which feel in communication with other—why should they do anything special to change so satisfactory a situation? Looked at theoretically we should suppose that the main thing is to make them *want* to get out, which they will not do until they feel isolated. Page 605.

FLAX-WASTE AS PACKING MATERIAL.

In my boyhood I saw flax-waste, and my memory is (nicely prodded up by page 606) that it does repel water somewhat. If we could only turn the wheels of time and civilization backward, and again have a flax-patch on each farm and flax-waste in each barn, how nicely we should pack bees for winter in an improved material! But my impression is that some materials which take water reluctantly will take it in the course of a few weeks, and then be as stubborn about drying out as they were about getting wet. How is that with flax?

THAT CANADIAN WINTERING-BOX.

As Mr. Alpaugh (page 606) has not yet put his wintering-box to test, only invented it, we are quite in order if we tell our minds as to how it will turn out. I'll say that the joint heat of the colonies will keep up the temperature inside quite a bit—when there is no need of it—also in severe weather before the bees have got to worrying, and much of the mischief has been already done; but when there is the most need of its working—in severe weather before the bees begin to worry—perchance he will find a thermometer in an empty box and one in his ten-colony box just about the same.

* The Home Circle. *

Conducted by Prof. A. J. Cook, Claremont, Calif.

FRAUDS, HUMBUGS AND SUPERSTITIONS.

Is there anything in this world of ours that is grander, and more delightful to the soul, than genuine truth, entire absence of pretense, perfect ingenuitiness? On the other hand, is there aught that is more repellant, more discouraging in society, than fraud, humbug, superstition, all—or anything that maketh a lie? Among the most blessed fruits of our high development of science is that she unearths frauds, reveals humbugs, and dethrones superstitions. She stamps her great, honest foot hard on whatever maketh a lie. How generously education touches her patrons to bless and to help. Is not one of her brightest crowns, that she so summarily dumps out of the mind its superstitions?

PATENT MEDICINES.

No doubt Holmes voiced a grand truth when he said that it would be a blessed thing if all the medicine of the world was dumped into the ocean; but, he added, it would be awful on the fish. As a learned and experienced physician, Holmes was entitled to speak. If he had prefixed medicine with "patent" how much more of truth would have been uttered. It is fearful to note the great floods of advertisements of patent medicines that fill the pages of our newspapers. Millions of dollars are poured annually into the cesspool of the newspaper. It is awful to think of the amount of these vile compounds that are gulped down by a too trusting and suffering people. A synonym for patent medicine would be FRAUD, in capital letters and underscored. This is patent, for are they not heralded forth as cures for all maladies? And are not all the tricks of the most artful, skillful and expert advertising agents employed to get these concoctions of the Evil One into the hands and stomachs of poor, suffering humanity? The poor, sick one grasps at a straw, and is too feeble often to judge, and so jumps from the frying pan of aching members and lacerated tissues into the fire of diseased tissues and organs swathed in poisons or hurtful concoctions.

How difficult for the most learned and competent physician to rightly diagnose a disease; and, when rightly determined, how difficult to find in medicine a cure or palliative. And yet the deluded victim of the patent-medicine vender gulps down the atrocious potion, all ignorant both of disease and remedy. It seems strange that any one possessed of judgment and reason can ever be duped into patronage of the patent medicine chest. The discouraging feature is that sickness dethrones judgment and reason as her first legacy. Will we not all, in our various home circles, lift our loudest voice against this greatest fraud of the century?

THE MOON.

At our Farmers' Institutes a very frequent question is asked, even in cultured Southern California, to-wit: Should the farmers observe the moon's phases in planting and gleanings? Of course, I always say plant when condition of soil, cultivation, and season of the year are right; and only watch the moon to see when to take evening rides with the "gude wife" or one's best girl. And yet when I say this, I see many a head shake which speaks dissent. It is passing strange how any such superstition hangs on when it once gets a foothold in one's beliefs. This belief, so utterly void of any scientific basis in truth, I suppose comes down from our credulous forefathers, and from the fact that good tillers who practice watching the moon usually have good crops, as they surely would had they never heard of the moon, or noted whether they saw it over the right or left shoulder. It is good to talk all such absurdities over with the children and bury them in wholesome laughter, for such burial is rarely followed with resurrection.

FRIDAY, AND THE RIGHT SHOULDER.

It seems impossible that in our day, when science shows the absolute absurdity of all such nonsense, that anyone would be disturbed by seeing the new moon over the left shoulder. Yet such is often the case. The person is usually advanced in years, for the science of today is hard on such tomfoolery. I have known not a few, some of them men of intelligence, who would never commence a new work or enterprise on Friday. They usually blush to own the fact, and do not pretend to have any reason for the opinion; but supersti-

THE STADIUM AT THE PAN-AMERICAN.

A quarter mile of racing track, and seats for 12,000 people.

tion is usually so inwrought in their make-up, that they feel that it will be dangerous to disregard this old law. Such persons still dread ghosts, and are haunted with the hundred and one other nonsensical beliefs in signs and sayings that are utterly without foundation, and which, like belief in witchcraft, will soon be only known to history. It will be a good riddance. There are so many grand beliefs that take hold of our very lives and help us to better thought and nobler action, for us to waste thought or energy on all such baseless claptrap.

ROAD-SIDE TREES.

What is there in this world that is more worthy of admiration than a fine avenue of trees? There is one of peppers and another of blue-gums not far from Claremont. I always drive to these and through them when I have visitors. Often the visitors will exclaim in surprised delight as we turn upon these lovely vistas. Can anything be finer than such avenues of trees? Ask the students who have enjoyed the elms of Cambridge and New Haven. Would not our home circles be philanthropists of the best kind, if they would undertake to secure such avenues along all our highways? I believe that if we combine utility and beauty, we show still better sense and judgment. So in the East, why not add to the honey-resources by planting great rows of fine lindens, or the equally umbrageous tulips? In the South the tulip and the Judas-tree are not only beautiful, but each comes each season with beautiful flowers laden with most delicious nectar. In California the eucalyptus is very handsome, is a strong grower, stands drouth well, and by a judicious selection of species we can have blossoms and nectar each month of the year. All have showy flowers, which, in some species, are very beautiful.

USE OF PROPER WORDS.

I have learned to have such respect for our good and genial friend, Mr. Hasty, that I rarely skip anything he writes, and as rarely find aught to criticize. So I was surprised that he suggests to let a bad use of words alone, as it will be useless to combat it. I say, Never. If a word is wrongly used, so as to mislead or work mischief, "go for it" with all the might, coat oil, and shirt sleeves rolled up.

Yesterday our pastor spoke of coral insects. He might as well say "woolly birds," or "hairy snakes." Indeed, he would not have been as wide of the truth. Coral animals belong to a branch wholly distinct from that of insects. The old word "strained" rarely peeps up now in descriptions of honey. Why? Because it was a mischievous misnomer. We hit it hard blows, and, happily, knocked the very life out of it. "Larva" is correct. "Worm" means a thing wholly different. The added syllable with truth to stand on should not vex anyone. The recent bulletins regarding our beloved President did not confuse the terms digestion and assimilation. Of course not, the physicians know and practice the right use of words, and do they not show good sense?

I should like to hear from our good friend, Dr. Miller, on this point.

Why Not Help a Little—both your neighbor bee-keepers and the old American Bee Journal—by sending to us the names and addresses of such as you may know do not now get this journal? We will be glad to send them sample copies, so that they may become acquainted with the paper, and subscribe for it, thus putting themselves in the line of success with bees. Perhaps you can get them to subscribe, send in their dollars, and secure for your trouble some of the premiums we are constantly offering as rewards for such effort.

REVERSIBLE WALL MAP

—OF THE—

UNITED STATES AND WORLD,

WITH SPECIAL INSET MAPS OF

Ghina, Cuba, Porto Rico, The Philippines, Hawaii, and Alaska,

Especially prepared to meet the demand for a first-class map that will give a quick, general idea of location of events the world over, and particularly to the United States and our territorial possessions. **Very useful in every Home and Office.**

66 x 46 INCHES IN SIZE.

ELEVEN BEAUTIFUL COLORS.

**Best and Most Necessary Map
Ever Issued.**

**No Home or Business House
should be without it.**

The Plates

are works of art. The engraving is plain, bold, and decisive. The color work is elegantly contrasted, but not gaudy.

Perfection and Artistic Elegance

a salient feature of this map not approached by any similar publication.

A Marginal Index

is one of the invaluable features.

It gives an alphabetical list of countries, their location on map, style of government, population, area, products, minerals, imports, exports, etc.

It has been pronounced a
Photograph of the World

The 1900 Census
of the largest American Cities is given.

One side shows a grand map of our great country, with **counties**, railroads, towns, rivers, etc., correctly located. The other side shows an equally good map of the world. Statistics on the population, cities, capitals, rivers, mountains, products, business, etc., a veritable photograph of the UNITED STATES AND WORLD.

The map is printed on heavy map paper and is mounted on sticks ready to hang. Edges are bound with tape.

1901 EDITION.—Every reader should consult it every day. The plates show all the new railroad lines and extensions, county changes, etc. Especial attention is given to the topography of the country; all the principal rivers and lakes, mountain ranges and peaks are plainly indicated. The leading cities and towns are shown, special attention being given to those along lines of railroads. The Canadian section of the map gives the provinces of Ontario, Manitoba, and British Columbia, with nearly all of Quebec and New Brunswick, the county divisions being clearly marked. The Southern portion of the map includes the Northern States of the Republic of Mexico, and the Bahama Islands.

On the reverse side is the Library Map of the World. The largest and most accurate map on Mercator's Projection ever produced. The political divisions are correctly defined and beautifully outlined in colors. The ocean currents are clearly shown and named. Ocean steamship lines with distances between important ports are given. A marginal index of letters and figures enables one easily to locate every country in the world. A series of short articles in alphabetical order is printed around the border of this map in large, clear type, containing valuable information concerning agricultural, mining, and manufacturing statistics, also the value of imports and exports in dollars. The area, population, form of government, and chief executive of every country in the world is given up to date, also the names of the capitals and their population. **The Inset Maps** are elegantly engraved and printed in colors. They are placed in convenient positions around the United States map, and will be invaluable to every person desiring a plain understanding of our possessions. An inset map of China on the World side of map adds to its value.

Two maps forward free as a premium for sending as **Three New Subscribers** at \$1.00 each; or for \$2.00 we will send the Map and the American Bee Journal for one year. Address,

GEORGE W. YORK & CO.,

144 & 146 Erie Street, CHICAGO, ILL.

Great Combination Subscription Offers.

Combination and concentration in business are the magic watchwords of the age in which we live. Why should it not be applied to the matter of subscriptions to magazines and periodical literature in general? We believe it is a wise move, especially when it is in the line of economy for the reading public. Now, if we can be the means of **saving** our subscribers **several dollars** a year on their reading matter, and at the same time help them to the best literature published to-day, we shall feel that we are doing a good thing, indeed.

We have entered into an arrangement whereby we can furnish the following excellent periodicals at greatly reduced prices:

	Regular price.	THE DOLLAR PAPERS.	Regular price.
Review of Reviews	\$2.50	Cosmopolitan Magazine	1.00
Current Literature	3.00	Frank Leslie's Popular Monthly	1.00
New England Magazine	3.00	The Household	1.00
Leslie's Weekly	4.00	Good Housekeeping	1.00
North American Review	5.00	The Designer	1.00
		Success	1.00

PLEASE NOTICE that in all combinations **Success** and the **American Bee Journal** must be included.

Here is our List of Liberal Offers:

American Bee Journal and Success

with any one of the above dollar magazines	\$2.50
with any two of the above dollar magazines	3.00
with any three of the above dollar magazines	3.50
with the Review of Reviews (new)	3.00
with Current Literature (new)	3.00
with New England Magazine	3.00
with Review of Reviews (new) and any one of the dollar magazines	3.50
with Leslie's Weekly	3.75
with Review of Reviews (new) and Leslie's Weekly	4.75
with North American Review (new) and Review of Reviews (new)	5.00

RENEWAL If a renewal subscription is wanted for the Review of Reviews, Current Literature, or the North American Review, add \$1.00 for each renewal subscription to the combination prices named above. On all the other combinations a renewal costs the same as a new subscription.

FOREIGN No foreign subscribers can take advantage of these combination offers.

We shall be pleased to have our readers examine carefully the above list, and send us their subscriptions. Address,

GEORGE W. YORL & CO.

144 & 146 Erie Street, CHICAGO, ILL.

STERN OLD MOTHER EXPERIENCE

has enabled us after 16 years to make perfect **The Reliable Incubator and Brooders**. You ought to have our 20th Century Poultry Book in the house. It will cost you but 10 cents and will make you a master in the poultry business.

Reliable Incubator & Brooder Co., Box B-2, Quincy, Ills.

Garden of Eden Was Irrigated.

When God made man and appointed him His most perfect condition He placed him on a piece of land watered by irrigation. Farming by irrigation still remains the most scientific and successful. With control of the water-supply the element of chance is completely eliminated, crops are sure, larger, and of better quality and command higher prices. The most successful and profitable farms in the United States are irrigated, 50 bu. of wheat, 100 bu. of oats, 300 bu. of potatoes, 5 tons of alfalfa per acre per year are regularly produced.

UNDER THE WILSON PLAN

such farms can be had for little money on easy terms, possessing the requisite of **Abundance of Water, Rich Soil, Home Markets, Good Society.**

We share profits with those who can advance cash for land. Profits large; no risk.

Address for Bulletin giving full detailed information,

Homestead Land and Irrigation Company,

79 DEARBORN STREET, CHICAGO, ILL.

Better Report this Year.

I have a better report for the season of 1901 than for 1899 and 1900. The bees came through in very poor shape, short of stores and bees, half of the colonies with practically nothing; but they built up in June nicely, making up any loss in winter, and storing about 30 pounds of surplus honey, spring count; and all hives were well filled for winter with good honey, and nearly all colonies had young queens. C. H. CHITTENDEN.
Middlesex Co., Conn., Oct. 16.

Honey a Light Yield.

The season here was good until the drouth set in July 10, when the excessive hot weather cut the flow short. The drouth of the air has caused the honey to be of heavy body and fine quality. I started with 18 good colonies in the spring, increased to 24, and have taken off 550 pounds of comb honey—about 30 pounds to the colony. It is a rather light yield, a little above an average with my neighbors. Bees are in good condition for winter. JOHN CLINE.

Lafayette Co., Wis., Oct. 23.

Crop Not as Good as Expected.

The honey crop is not as good as was expected by the bee-keepers of this section. With a late, wet spring the bees did not swarm very early, and, therefore, were not ready to catch the first honey-flow. However, the basswood honey was a better crop than last season, at least in some parts of Pennsylvania. Buckwheat honey was almost a failure this season, there being very rainy weather at the time it was in bloom. I find a good sale for comb and extracted honey. Bees are in fine condition for winter.

W. H. HEIM.

Lycoming Co., Pa., Oct. 14.

Poor Year for Honey.

This has been a very poor year for honey on account of the drouth, but I think most of the bees are well fixed for winter. I started with 3 colonies, spring count, and increased to 11, and got about 75 pounds of nice comb honey. Our spring honey-flow lasted only about two weeks, then came the drouth; but I think the fall flow will prove sufficient for wintering. W. H. ELLIS.

Calhoun Co., Iowa, Oct. 12.

Crop Nearly a Total Failure.

Through smelter smoke, drouth, and grasshoppers the bee-industry in this county, as a rule, has been nearly a total failure. I have 56 colonies at Pleasant Green, where they have hitherto always done well, but this season, owing to the grasshoppers eating the crops off bare to the ground, I have not taken off a pound of honey, and the bees are several hundred pounds lighter—perhaps 10 to 15 pounds to each colony less than they were last year.

No. 1 comb honey is worth \$3.00 per case, and extracted is worth 6 to 7 cents a pound, according to quality. The Omaha report of Peycke Bros. in the American Bee Journal, is a burlesque as far as Utah is concerned.

E. S. LOVENS.

Salt Lake Co., Utah, Oct. 22.

The Honey Crop and Prices.

We note in the American Bee Journal of Sept. 12 some dealers quote Utah comb honey at 10 cents for No. 1, and 9 to 9 1/2 cents for No. 2. This is a mistake. We have this season a quarter of a crop of what it was last

Dark Combs and Color of Honey.

"Dark old combs give to honey a darker color. This is the experience of some—others say no. Why this difference of experience?"

—Bee-Keepers' Review. May there not be a difference as to careful observation? Will not the length of time the honey is in the comb also make a difference in color? Fill a black comb with water, and immediately throw it out, and the water will be clear. Let it soak for a number of days and it will be like ink.—Gleanings in Bee-Culture.

"Reviews" from the Bee-Keepers' Review.

TOO MANY IRONS IN THE FIRE, is a bad condition of things. I saw it illustrated in several instances in my recent trip through Ontario. So many made excuses about the appearance of things, and of the way in which they were obliged to work, and of how they were behind, and always driven with work, all because they had so much to do; as one man said, he was "tired out all of the time." For instance, Mr. McEvoy has an apiary of about 100 colonies, several acres of berries, and is inspector of apiaries for Ontario. All need his attention at the same time, and he was free to acknowledge that had he turned his attention to bees, years ago, his financial success would have been many times greater. Those men who had bees alone, and a lot of them, were making the most money with far less worry.

A HIVING-BOX made from a cheese-box was one of the handy things that I found in the apiary of Jacob Albaugh, of Ontario. Two staples on the side of the box are for slipping in the end of a long pole, whereby to raise the box up under the cluster on the limb of a tree. The bottom of the box is covered with muslin. The cover is also of muslin, but it is fastened at only one edge, opposite the side where the staples are, and can be drawn over the top of the box by means of two strings passing over the edge of the box and down the pole. When there is a warm to get down, the box is put upon the pole, the cover slipped back, the box raised up under the cluster, and the limb given a sharp jar by means of the pole. This causes the bees to drop into the box, when the cover is quickly drawn over them by means of the string, making them close prisoners. The box, jars and all, may be shipped off the pole, and set to one side in the shade, where it may be left until the bee-keeper has leisure to

—BEST—

Extracted Honey For Sale

ALL IN 60-POUND TIN CANS.

Alfalfa Honey

This is the famous White Extracted Honey gathered in the great Alfalfa regions of the Central West. It is a splendid honey, and nearly everybody who cares to eat honey at all can't get enough of the Alfalfa extracted.

Basswood Honey

This is the well-known light-colored honey gathered from the rich, nectar-laden basswood blossoms. It has a stronger flavor than Alfalfa, and is preferred by those who like a distinct flavor in their honey.

Prices of Alfalfa or Basswood Honey:

A sample of either, by mail, 10 cents, to pay for package and postage. By freight—two 60-pound cans of Alfalfa, 8 cents per pound; four or more cans, 7½ cents per pound. Basswood Honey, ½ cent more per pound than Alfalfa prices. Cash must accompany each order. You can order half of each kind of honey, if you so desire. The cans are boxed. This is all

ABSOLUTELY PURE HONEY

The finest of their kinds produced in this country.

Read Dr. Miller's Testimony on Alfalfa Honey:

I've just sampled the honey you sent, and it's prime. Thank you. I feel that I'm something of a heretic, to sell several thousand pounds of honey of my own production and then buy honey of you for my own use. But however loyal one ought to be to the honey of his own region, there's no denying the fact that for use in any kind of hot drink, where one prefers the more wholesome honey to sugar, the very excellent quality of alfalfa honey I have received from you is better suited than the honeys of more marked flavor, according to my taste. C. C. MILLER. McHenry Co., Ill.

Order the Above Honey and then Sell It.

We would suggest that those bee-keepers who did not produce enough honey for their home demand this year, just order some of the above, and sell it. And others, who want to earn some money, can get this honey and work up a demand for it almost anywhere.

GEORGE W. YORK & CO., 144 & 146 Erie St., Chicago, Ill.

hive them. It is well to have several boxes, and poles of different lengths.

CAUTIONARY LABELS seldom add much figure with freight handlers. They must be very striking to attract attention. Mr. A. E. Hoshall, of Ontario, has certainly chosen a heading that will quite likely be read. Here is the label that he uses on packages of comb honey when he ships them:

DANGER!

DON'T DROP. This Package Contains COMB HONEY, and it will be Broken if Dropped, Roughly Handled, or Moved in a Dray or Wagon Without Springs.

Kindly Lift the Crate by the Handles, and Set Down Carefully.

I suppose when the freight handlers read the heading they think they have got hold of dynamite or gunpowder, but when they read on and find it is only sweet and harmless honey, the question is, if they will not be disgusted at the rate that has led them to read the label, and get back at the shipper by giving the package an extra tumble.

POLITENESS IN BUSINESS is a great factor. When visiting at Mr. F. J. Gemmill's, in Ontario, Mrs. Gemmill's mother, an old Scotch lady, was telling me how well a neighbor across the way was succeeding as a florist, while his predecessor had been compelled to sell out for lack of patronage. I expressed my surprise, and asked how it was that the first man had failed. "He hadn't the sense to speak gentle to the people," was the comprehensive reply. Then she went on to explain that he waited upon customers with a condescending air, as though he were bestowing a great favor. If he had more flowers than orders, or the flowers were beginning to fade, he would never give one to a neighbor, but would throw them away—even burying them in the ground that they might not be picked up. The man who now has charge of the business delights in giving to neighbors any flowers for which he has no sale. Such flowers are often sent to the hospital. These things become noised abroad, and beget a kind feeling for the giver.

Bee-keepers can do much to keep their customers by having the sense to "speak gentle" to them. Many an order is lost (and many a one secured) just from the character of the letter sent in reply to an inquiry. I don't believe in fulsome flattery, nor in a servile prostration of one's self at the feet of a customer, but there is a pleasant politeness that lowers no one's self-respect, yet sends every one away a pleased customer.

KEEP MORE BEES. For years bee-keepers have been asking *how to do things*, and the matter of manipulation, hiveing, supering, extracting, wintering, etc., has been brought to a high degree of perfection. Specialists can better afford to turn their efforts in some other direction than that of petty details. Great success must be looked for in some radical change. As I bring before my mind man after man whom I have met on my Canadian trip, I ask myself, "Which ones have been the most successful?" Invariably the answer is forced upon me, "The ones that have the most bees." It is a simple thing, isn't it?

FOUNDATION is put into Heddon frames by Mr. Miller, of Ontario, in the same way that the Daisy put starters into sections. There is this difference, however, that there is some difficulty with such a long strip, in getting it in straight and exactly in the center of the top-bar. To overcome this, the frames are first wired, and when the foundation is put in they are supported by a tilting framework, at a slight angle, so that the wire supports the foundation and keep it from toppling over while the wax is coming. If the foundation does not strike the frames exactly right, a straight edge is pressed against the foundation, forcing it into position before the wax sets. Afterwards the wire is imbedded. A stiff, upright wire is used in the

center of the frame to prevent any sagging of the top-bars. Mr. Miller likes a battery for imbedding the wires; the only objection being that it becomes weak and requires renewing so often. I think the little spur-wheel arrangement works well.

FINDING QUEENS without the tedious operation of looking over the combs one at a time, some sure, short-cut method would be very desirable. The nearest approach to this that I know of is one employed by A. E. Hoshall, of Ontario. He first removes the cover from the Haddon hive, puts on a break-joint honey-board, then a queen-excluding honey-board, and on the top of the queen-excluder a super or a box the same size as the top of the hive. The bees are then smoked at the entrance, which frightens and drives the queen into the upper case of the brood-chamber, which is now taken off, honey-boards, empty super and all, and set upon a frame-work supported upon legs. Smoke is then puffed up under combs, which soon sets the bees to running up through the honey-boards into the empty super on top. Of course the queen attempts to follow, and readily passes up through the break-joint honey-board, but further progress is barred by the queen-excluder, and she is easily found between the two honey-boards. When the queen is single case of a brood-chamber, there is no necessity for even removing it from the bottom-board; simply remove the cover, put on the honey-boards and empty super, and apply the smoke at the entrance. A queen can often be found by simply removing the cover and honey-board and puffing a little smoke at the entrance. It is astonishing how little smoke will send a queen up on top of the frames; where a little close watching and spyglass on the part of the operator will enable him to pick her up before she slips back again.

CONVENTION NOTICES.

Chicago.—The executive committee of the Chicago Bee-Keepers' Association has ordered that the next meeting be held all day and evening, Dec. 1, 2, 3, 4, at the Briggs Hotel, Chicago. This is arranged on account of the low rates to be in force then for the International Live-Stock Exposition in Chicago at that time (Nov. 30 to Dec. 7), being one fare plus \$2.00 for the round-trip. This notice goes by mail to nearly 300 bee-keepers near Chicago, and should result in the largest attendance we have ever had. Dr. C. C. Miller and Mr. C. P. Dadant have promised to be present. Let all come.

HERMAN F. MOORE, Sec.
GEORGE W. YORK, Pres.

Colorado.—The Colorado annual meeting promises to be a genuine success. The program has been made out for a number of weeks, and is almost ready for publication. It has come to be a privilege and an honor to read a paper before our Association, and so very few decline who are invited to write or speak for instruction. One paper is ready in the hands of the secretary. On two or three nights a big magic lantern will illustrate talks by famous students of bees and the bee industry. And then we are going to have an exhibition of the best honey in the United States (made in Colorado, you know), and wax, with bees enough to show "how the thing is done."

If you want to know more, or have forgotten the dates, Nov. 18, 19, 20, write to the undersigned, box 432, Denver, Colo.

D. W. WORKING, Sec.

The Cyphers Incubator Co. October 1st the factory and home offices of the Cyphers Incubator Company were moved from Wayland to Buffalo, N. Y., where they have largely increased space and every modern facility, for conducting their increasing business. We are pleased to inform our readers that this company received the Gold Medal and highest award at the Pan-American Exposition. They have been liberal patrons of our advertising columns for several years, and expect soon to begin the pushing of their business for next season. Look out for their advertisement, and if in need of anything in their line write them.

HONEY AND BEESWAX

MARKET QUOTATIONS.

CHICAGO, Oct. 30.—There is a very good trade in No. 1 comb honey at 15c per pound; that which will not grade No. 1 or fancy sells at from 13c to 14c; some small lots of fancy have brought more than 15c; light amber selling at 12c to 13c; the dark honeys of various grades range at from 10c to 11c. Extracted sells fairly well at 5½¢ to 6¢ for white, according to quality and flavor; white clover and burdock bringing 6c; light amber, 5½¢ to 6c; 5½¢ to 6c. Beeswax steady at 28c. R. A. BURNETT & CO.

CINCINNATI, Oct. 25.—The honey market is rather dull on account of the warm weather. Extracted sells only to manufacturers from 56¢ to 60¢; better grades alfalfa water-white from 66¢ to 67¢; white clover from 80¢ to 82¢. Fancy white comb honey sells from 13½¢ to 15¢.

C. H. W. WEBER.

ALBANY, N. Y., Oct. 25.—Honey in good demand now, as this is the most satisfactory time to sell. The crockerymen are stockpiling with buy lines, when late they only buy what comes to piece out. Fancy white comb, 15¢ to 16¢; mixed, 14¢ to 15¢; buckwheat, 12¢ to 13c. Extracted, white, 6½¢ to 7¢; mixed, 6½¢ to 6c. H. R. WRIGHT.

OMAHA, Oct. 25.—New comb honey is arriving by express in small quantities from Iowa and Colorado, and selling at \$3.50 per case in retail way. California extracted honey is being offered carlots at 4½¢ to 4c per pound, l.o.b. California. No. 1 standard No. 1, 13c; No. 2, 12c; No. 3, 11c. No. 4, 10c. No. 5, 9c. No. 6, 8c. No. 7, 7c. No. 8, 6c. No. 9, 5c. No. 10, 4c. No. 11, 3c. No. 12, 2c. No. 13, 1c. No. 14, 1c. No. 15, 1c. No. 16, 1c. No. 17, 1c. No. 18, 1c. No. 19, 1c. No. 20, 1c. No. 21, 1c. No. 22, 1c. No. 23, 1c. A New Bee-Keeper's Song—

"Buckwheat Cakes and Honey"

Words by EUGENE SECOR.

Music by GEORGE W. YORK.

This song was written specially for the Buffalo convention, and was sung there. It is written for organ or piano, as have been all the songs written for bee-keepers. Every home should have a copy of it, as well as a copy of

"THE HUM OF THE BEES in the APPLE-TREE BLOOM"

Written by

EUGENE SECOR and DR. C. C. MILLER.

PRICES—Either song will be mailed for 10 cents (stamps or silver), or both for only 15 cents. Or, for \$1.00 strictly in advance payment of a year's subscription to the American Bee Journal, we will mail both of these songs free, if asked for.

GEORGE W. YORK & CO.

144 & 146 Erie St., CHICAGO, ILL.

Texas Bee-Keepers.

New Branch Office. We beg to announce the opening of a branch office and warehouse at 438 W. Houston St., San Antonio, Texas. Rates of transportation from Medina in less than car-load lots are high, and it takes a long time for a local shipment to reach Southern Texas points.

**Low Freight and
Quick Delivery.**

**San Antonio as a
Shipping-point.**

To secure these two necessary advantages—low freight and quick delivery—and to be better prepared to serve the interests of our Texas friends, is our reason for establishing this new branch office. No other point in Southern Texas is better adapted to serve as a distributing point than San Antonio. It has four great railroads—the Southern Pacific R. R. east and West—the International and Great Northern R. R. from Laredo up through San Antonio and Central Texas, the San Antonio and Arkansas Pass R. R., and San Antonio and Gulf R. R. It also has the American, Wells-Fargo and Pacific Express Companies.

Our Managers.

We have secured as managers Mr. Udo Toepperwein, formerly of Leon Springs, and Mr. A. Y. Walton, Jr., both of whom are well known to the bee-keepers of South and Central Texas. They are also thoroughly familiar with practical bee-keeping and all matters associated with it, and any orders sent to this branch will receive prompt, careful attention.

Our Goods.

As usual our motto is to furnish the best goods of the most approved pattern. We do not undertake to compete in price with all manufacturers. Bee-keepers have learned that it does not pay to buy cheap supplies, for a saving of 10 cents on the first cost of a hive may be a loss of many times this amount by getting poorly made and ill-fitting material. Every year brings us many proofs that our policy of "the best goods" is a correct one.

Our Catalog.

Very few changes in prices will be made in our new catalog, so do not delay your order, but send it at once. You will be allowed a refund if lower prices are made, and in case of higher prices ruling in the new catalog, if any, you will secure the benefit by ordering now. Catalog and estimates may be had by applying to the address given below.

Our Invitation.

Whenever you visit San Antonio you are invited to call at our office and make it your headquarters. Here you will find a display of Apianian Supplies not equalled elsewhere in Texas. You will also find on file the leading bee-journals to pass pleasantly your leisure time.

Spanish Catalog.

Some of you may read Spanish, or have a bee-keeping friend who does. If so, call for our Spanish catalog. It's sent free.

ERNEST R. ROOT, President.
DR. A. KIRK, Vice-President.
DR. A. B. MASON, Secretary, Toledo, Ohio.

ERGENE SECOR, General Manager and Treasurer, Forest City, Iowa.

MEMBERSHIP DUES, \$1.00 a year.

☞ If more convenient, Dues may be sent to the office of the American Bee Journal, when they will be forwarded to Mr. Secor, who will mail individual receipts.

A Celluloid Queen-Button is a very pretty thing for a bee-keeper or honey-seller to wear on his coat-lapel. It often serves to introduce the subject of honey, and frequently leads to a sale.

NOTE.—One reader writes: "I have every reason to believe that it would be a very good idea for every bee-keeper to wear one [of the buttons] as it will cause people to ask questions about the busy bee, and many a conversation thus started would wind up with the sale of more or less honey; at any rate it would give the bee-keeper a superior opportunity to enlighten many a person in regard to honey and bees."

The picture shown herewith is a reproduction of a molito queen-button that we are furnishing to bee-keepers. It has a pin on the underside to fasten it.

Price, by mail, 6 cents; two for 10 cents; or 6 for 25 cents. Send all orders to the office of the American Bee Journal.

Weekly Budget.

We (this time the "we" includes Mrs. York) had a splendid visit last week, for a day and two nights, at Dr. C. C. Miller's, in McHenry Co., Ill. We expect to have more to say about it later. Dr. Miller is well, and enjoying life better than most young men who are on the other side of 70.

MR. GEO. W. RIKER, of Lucas Co., Iowa, writes us that he expects to be present at the meeting of the Chicago Bee-Keepers' Association, on Dec. 5. He will then be on his way to New York—his old home—where he commenced bee-keeping in 1868, six miles north of Auburn. Next spring he expects to go to Colorado with his 200 colonies of bees. Rev. Jasper—the colored preacher—said, "The sun do move." Surely, bee-keepers "do move," too. They are more and more going to locations where they can "keep more bees." Success to them all.

MR. J. W. FERREE is the foul-brood inspector for Los Angeles Co., Calif. "Rambler" has this to say about him, in *Gleanings in Bee-Culture*:

"Mr. Ferree is a genial bachelor, a member of Dr. Bresee's church; will go a long way to serve a friend; generous every day in the week; polite and condescending to the ladies; always shows an even temper; and the mantle of foul-brood inspector could not have fallen upon more worthy shoulders."

Mr. Ferree has inspected 148 apiaries, 8010 colonies; 284 foul-brood colonies. He estimates that there are 300 bee-keepers and 20,000 colonies in Los Angeles county. Mr. Ferree seems to be the right man in the right place.

THE APIARY OF J. M. PAXTON, of Brooks Co., Ga., is shown on page 711. He commenced bee-keeping in 1899, buying an apiary of 29 colonies of Italian and black bees. In May he bought the bees and honey crop of about 1000 sections of comb honey. He had but little or no experience in bee-keeping, but sent for the book, "A B C of Bee-Culture," and did fairly well the first year. The bees were kept about one-half mile from his home. He paid \$150 cash for the bees and outfit, and sold about \$120 worth of honey the first year. He moved the bees home the following winter, and lost five colonies, having 22 spring count. He increased them to 41, and sold \$113.50 worth of honey that year, which was a very poor one for bees in that part of the country.

HORSEMENT—MONARDA PUNCTATA.—The engraving of this honey-plant, shown on the first page, is kindly loaned to us by *Gleanings in Bee-Culture*, from which periodical we also take the following paragraph:

"Horsement begins to bloom in May, sometimes a little later, June, depending on the season, such as a very dry and a backward spring. The honey is compared with that of the basswood of the North, on account of its peculiar strong flavor which it resembles; it is of light color; one of the best honey-plants of the South, and tremendous yields have been obtained. I have just gone out to procure

some of the flowerets, and send some to you herewith. Perhaps you remember what you said about a chance for long tongues while taking the shot at the horsement on our porch. I have been interested in this question, and can not see how short-tongued bees could ever get everything that is nectar out of those long tubes. What do you think about it? Red clover not alone for long tongues."

Editor Root took the picture while in the South, and also wrote the above paragraph there.

PEARS IN CALIFORNIA.—Mr. B. S. Taylor, of Riverside Co., Calif., writing us Sept. 16, said:

"I enclose a small picture that will give some idea of how pears grow in California. The branch was taken from a small tree growing in my front yard. I think they are the Bartlett, but I am not certain. It is one limb, and there were 67 of them in the two clusters at the time photographed, though about 20 had previously fallen off."

Surely, California is a wonderful fruit country. We think we never saw such clusters of fruit growing anywhere as are shown in the picture. It wouldn't take long to pick a few bushels of them when growing so thick. (See page 714.)

MR. JOHN H. MARTIN (Rambler), of California, writing us Oct. 26, said:

"I am packing up and going to move over into Cuba to sojourn there through the winter. By so doing I secure a continuous honey-yield all the year round, thus: Field No. 1, in southern California, from April until July; Field No. 2, in central California, from July until October; Field No. 3, in Cuba, from October until April."

Rambler ought to be the sweetest rambling man in all the world—continuously sweet.

But isn't it rather risky for him to go over into Cuba? Some of those chocolate-colored young ladies in that "Pearl of the Antilles" will be making "goo-goo eyes" at him, and then where will honey be?

And, just think, if a Cuban girl should be able to accomplish what no Californian belle has been able to do!

Rambler, you'd better come to Chicago.

THE THANKSGIVING NUMBER of the *Ladies' Home Journal* is replete with good fiction and interesting and novel features. It opens appropriately with an article which tells "Where the President's Turkey Comes From." Then there are delightful stories by Hezekiah Butterworth and Laura Spencer Porter, and a new love story called "Christine," by Frederick M. Smith. Cleveland Moffett has an interesting story about Ira D. Sankey, the great evangelist, and Edith King Swain recounts the famous ascents she has made in various parts of the world. Will Bradley's original designs for a house begin with the breakfast-room, and Wilson Eyre, Jr., presents plans for a country-house and a garden. Mr. Bok gives much good advice to young married couples in his editorial. Another most timely feature is, "Why Should a Young Man Support the Church?" by the Rev. Francis E. Clark. Many home-made Christmas gifts are shown, and the first of "The Journal's Amusing Puzzles" appears. The regular departments are exceptionally good, and the illustrations superb. By The Curtis Publishing Company, Philadelphia. One dollar a year; ten cents a copy.

AMERICAN BEE JOURNAL

ESTABLISHED IN 1861

THE OLDEST BEE-PAPER IN AMERICA

41st YEAR.

CHICAGO, ILL., NOVEMBER 7, 1901.

No. 45.

Editorial.

The Chicago Convention.—One of our correspondents, who evidently is interested in the next session of the Chicago Bee-Keepers' Association, writes us as follows:

"MR. EDITOR:—In the notice of the convention to be held in Chicago, Dec. 5, it is said that the railroad rate is 'one fare plus \$2.00 for the round trip.' That is given as the reason for holding the convention at that time. But if it is a convention of Chicago bee-keepers, a rate of that kind would not be any benefit to them, nor indeed to any one living within less than 70 miles of the city. Is it to be understood that Chicago includes all the surrounding States?"

PLAIN BEE-KEEPER.

No, Chicago has not expanded to quite that extent. But there's nothing small about Chicago bee-keepers, and residence in Chicago is not essentially requisite to membership in their society. Indeed, at their previous meetings, bee-keepers from a considerable distance have generally taken a prominent part. The live-stock show will bring to Chicago quite a number who are more or less interested in bees, and the low railroad rates will, it is hoped, attract others. There is no reason why there should not be the same gathering of bee-keepers in Chicago, Dec. 5 as were formerly gathered at the meetings of the Northwestern Association, so pleasantly remembered by many as among the most successful bee-conventions ever held.

Fastening Frames for Hauling may be accomplished by driving a nail partly in at each end of each top-bar, or by slipping wedges between the top-bars at each end. R. F. Holtermann gives, in *Gleanings in Bee-Culture*, a plan that may be better, as follows:

A separator cut into four pieces will do. Lay this across the ends of the frames and drive a small tack through this into the bar, and they will not only keep from moving sideways, but the piece across will prevent the frame from swinging at the bottom.

Glucose-Feeding.—A remark in "The Afterthought" calls forth the following:

MR. EDITOR:—On page 681, Mr. E. E. Hasty, referring to an editorial on page 579, says: "It is somewhat in the line of news to be told that one *can* feed a ton of glucose to his bees." Does that mean that it is news that bees will take so large an amount, or that they will take glucose at all?

SUBSCRIBER.

It is hardly news that bees will take glucose at all—sometimes. They are not likely to feed upon it voraciously when good, honest

nectar is within easy reach. Whether under any circumstances a very large amount could be fed at one time may be questioned. The editorial does not distinctly say what our sharp-eyed "afterthinker" seems to understand it to say, namely: "that one *can* feed a ton of glucose to his bees. It says that a certain bee-keeper *tried* to feed that amount. That does not say whether the whole of that amount was taken by the bees. Even if that amount was all taken, it would not necessarily be such a very large amount for each colony, when it is noted that the colonies were numbered "by the hundreds."

Glucose as bee-food is reported in *Le Progrès Apicole* as producing diarrhea in some cases and constipation in other cases. Some across the Atlantic report no inconvenience to the bees from its use, while others report heavy losses by death where glucose has been fed. These discrepancies are accounted for by the inconstancy of the product, some samples being pure, or nearly so, while many others contain free sulphuric and hydrochloric acids, etc., and often traces of arsenic.

The safest thing for bee-keepers to do with glucose is to let it entirely alone. "Touch not, taste not, handle not," is good advice.

Price of Honey receives further attention in *Gleanings in Bee-Culture*, without, however, materially adding new light; at least there seems no reason to change the view heretofore given in these columns, and it may be well to repeat that one will not be likely to go far astray if one closes promptly with any offers made at last year's prices. A note from Dr. Miller has some bearing on the subject. He says:

"I'm sorry to say I had not time enough to call on you either on my way to Jacksonville or on my return. I did, however, make a pop call on R. A. Burnett in passing. He promptly introduced the subject of prices on honey. I had considered his theory that rumors of a big crop helped to increase sales without lowering prices, and thought it utterly untenable. I do not know that I have entirely changed my views, but I must confess that after hearing him give cases right out of his experience that seemed to support his theory, I don't feel so sure of my ground as I did. It seems, however, that in the long run the greatest good to the greatest number ought to be secured by having 'the truth, the whole truth, and nothing but the truth.'"

"The Life of the Bee," by Maurice Maeterlinck, translated by Alfred Sutro, is a unique work. It is not intended to supplant or to supplement any of the text-books as a text-book. The author says: "It is not my intention to write a treatise on apiculture or on practical bee-keeping." The man who has mastered the contents of one of our ex-

cellent text-books will learn nothing new from this work. But he will find the everyday facts about bees, with which he is already familiar, painted in such exquisite fashion that they will seem almost new to him.

The book contains 427 pages, with an undue amount of white paper, for the page measures 7½ by 5 inches, while the printed portion is only 4½ by 2½.

One wonders at such spelling as "labour," "favour," "savour," and "waggon" in a book fresh from the press, and still more to find "swarm" used for "colony," and "hive" with the same meaning. But these are minor matters, and we must remember that the book is a translation.

The author says: "I shall state nothing, therefore, that I have not verified myself, or that is not so fully accepted in the text-books as to render further verification superfluous. My facts shall be as accurate as though they appeared in a practical manual or scientific monograph." Yet the practical bee-keeper will hardly forbear some doubt as to the accuracy of some of the supposed facts. Dzierzon's hive, "still very imperfect, received masterly improvement at the hands of Langstroth;" when, as a matter of fact, Langstroth completed his invention before ever hearing of Dzierzon's hive, and no after-improvement was made. (Page 15.)

Our author will delight the heart of the Rev. W. F. Clarke, when he teaches that the bees "ensure the preservation of the honey by letting a drop of formic acid fall in from the end of their sting." (Page 43.)

Sixty or seventy thousand as the number of bees in an average swarm will stretch the credulity of the average bee-keeper, to say nothing of our good friend, the editor of *Gleanings in Bee-Culture*. (Page 46.)

In speaking of preparation for swarming, the author says: "The bee-keeper has only to destroy in their cells the young queens that still are inert, and, at the same time, if nymphs and larvae abound, to enlarge the store-houses and dormitories of the nation, for this unprofitable tumult instantaneously to subside, for work to be at once resumed, and the flowers revisited; while the old queen, who now is essential again, with no successor to hope for, or perhaps to fear, will renounce this year her desire for the light of the sun." (Page 56.) Beautiful as is the language in that sentence, and much as the practical bee-keeper would like to believe it, he will hardly believe it a general rule that when preparations for swarming are made, all he has to do is to destroy queen-cells and give more room to secure the abandonment of all further thought of swarming for the season.

Do swarming bees carry with them "a certain amount of propolis," as stated on page

58? G. M. Doolittle must change his practice if he believes the teaching on page 87, that the workers accompanying a queen sent by mail should be "selected as far as possible from among the oldest bees in the hive." On page 100, we are told the workers will never sting a queen. The bees of an issuing swarm "have abandoned not only the enormous treasure of pollen and propolis they had gathered together, but also more than 120 pounds of honey." (Page 132.)

After a swarm is sufficiently settled, the queen begins to lay. "From this moment up to the first frosts of autumn, she does not cease laying; she lays while she is being fed, and even in her sleep, if indeed she sleeps at all, she still lays." (Page 215.) When a young bee has gnawed open its cell, "the nurses at once come running; they help the young bee to emerge from her prison, they clean her and brush her, and at the tip of their tongue present the first honey of the new life." (Page 236.) Other errors can be found for the seeking.

Beauties can also be found, and with less seeking. In fact, they abound. Take a passage, selected almost at random, from page 234. A swarm has issued, and the old home seems deserted:

"And for all that the moment may appear gloomy, hope abounds wherever the eye may turn. We might be in one of the castles of German legend, whose walls are composed of myriad phials containing the souls of men about to be born. For we are in the abode of life that goes before life. On all sides, asleep in their closely sealed cradles, in this infinite superposition of marvellous six-sided cells, lie thousands of nymphs, whiter than milk, who, with folded arms and head bent forward, await the hour of awakening. In their uniform tombs, that, isolated, become nearly transparent, they seem almost like hoary gnomes, lost in deep thought, or legions of virgins whom the folds of the shroud have contorted, who are buried in hexagonal prisons that some inflexible geometrician has multiplied to the verge of delirium."

A considerable portion of the book is taken up with philosophizing about things remotely connected with bee-keeping, if connected at all, many successive pages having no reference to bees, and the philosophy is by no means of the most optimistic character. The last 60 pages are occupied with a plea for evolution, the whole 60 pages being to the man who seeks practical instruction about bees an utter void. As arguments to show progress in the development of bees is cited, the fact that flour will be used in place of pollen, cement in place of propolis, and the fact (?) that black bees transported to California, where summer is perpetual, after one or two years "will cease to make provision for the winter."

But when the author confines himself to bee-talk, his work is commendable in the extreme for its exquisite beauty. If the publishers were to cut out perhaps a third of the book, giving only the part relating directly to bees, it would no doubt be more relished by bee-keepers in general.

The book is published by Dodd, Mead & Co., 372 Fifth Ave., New York, N. Y. Price \$1.40, postpaid. It can be ordered from the office of the American Bee Journal.

Green were the leaves at sunset.

To-day they're scar and red;

Like men they play their proper part.

Then fall to earthy bed.

The Buffalo Convention.

Report of the Proceedings of the Thirty-Second Annual Convention of the National Bee-Keepers' Association, held at Buffalo, New York, Sept. 10, 11 and 12, 1901.

(Continued from page 694.)

Response by Dr. C. C. Miller.

Just a little while ago Pres. Root said to me that he wanted me to say a few words in response to Dr. Smith's address of welcome, and my heart sank. I said that I didn't know that I could put on dignity enough for that; but when I found that I was to respond to plain, unadulterated Smith, it made the task easier, and I must say that there has come to me something of a surprise. If there is one thing above others that I don't want to see the time taken up with in a convention of bee-keepers it is an address of welcome and the response thereto; and in trying to make a response the thought generally will be, now what shall be said different from what has already been said? In what has been said today there has been an intellectual word of welcome, recognizing with a great deal of intelligence something as to what we are trying to do for the world, so that I do really feel that we are welcome. We are welcome to this room, which is something that we are really receiving, something of real value, and the word that has been spoken of encouragement as to our work has been something that is of value, and I do hope that fruits may grow from it.

Now, if you please, allow me to turn the tables just for a moment and speak a word of welcome—let me make an address of welcome. We do welcome such words from such men; we do welcome a feeling of recognition, of intelligent appreciation, and I want to say, as a citizen of the United States, a word that I have said in private, that we welcome our brethren from across the line. I don't know whether the Canadian brethren know how kindly we feel toward them. I trust that the feeling of brotherly affection that these words of welcome that our plain friend Smith has spoken to us will make us feel this stronger than we ever have felt it before; and that in the moving of a kind Providence the good work that may be done will be a pleasant thing for us to remember all the remaining days of our lives.

The convention was then favored with a song by Miss Ethel Acklin, of Minnesota, entitled, "My First Music Lesson."

Mr. N. D. West, one of the inspectors of black brood and foul brood, of the State of New York, then read a paper on the subject, as follows:

Black Brood, Foul Brood, and Bee Inspection in New York.

The bee-keepers in several counties of eastern New York have had a hard fight with a new contagious bee-dis-

ease. Dr. Howard, of Fort Worth, Tex., has made many examinations of diseased brood sent to him by myself from different apiaries. Dr. Howard said, the disease being new and differing from the old time foul brood, he would, for convenience, call it "Black Brood." It is very similar to foul brood, which we have known for years, and the treatment for its cure is about the same, but it does not yield so kindly to treatment, and it spreads more rapidly.

With us the black brood started at Sloansville, in the northern part of Schoharie County, some six or seven years ago. Many whole apiaries died, and the disease kept spreading on and on until it had reached other counties, and it seemed as if all bees must die. The disease spread rapidly, and ruined all of the surrounding apiaries for many miles. It was known as "foul brood," and surely it was a foul brood.

Finally, Charles A. Wieting, Commissioner of Agriculture of the State of New York, appointed Mr. Frank Boomhower as his agent for bee-inspection, to exterminate the disease in Schoharie county.

Mr. Boomhower went to work and inspected apiaries, and he caused a great many colonies to be burned, hives, honey, bee-stands, etc., wherever he could find the first trace of the disease. The apiarists became more and more alarmed and they were dissatisfied with the inspection which caused so much destruction to their bees and bee-fixtures that many of them would claim that their very best colonies were unnecessarily destroyed by fire. Many apiarists who knew they had diseased brood would not admit it, and they considered the bee-inspector an enemy who delighted in destroying their bees because the law gave him the opportunity to do so.

Quite late in the fall Mr. Boomhower was laid off from his work as bee-inspector. In 1899 the bee-law was amended so it gives the apiarist a chance to cure his own bees, and if he is successful the bees will not be destroyed. Commissioner Wieting has since appointed four agents as bee-inspectors for the State of New York. These agents are inspecting apiaries and are instructing the bee-keepers as best they can how to treat their apiaries if they have diseased colonies, only destroying those colonies that are weak. If their owners will treat them properly, and do all they can to prevent the further spread of the disease, according to instructions given by the agent, the diseased colonies are not destroyed.

This diseased territory, having Sloansville for its center, is about 65 miles east and west, and about 45 miles north and south. Many apiarists have

so learned to treat and handle their diseased colonies that our apiaries are improving. The prospects are better. Bee-keepers in the midst of the diseased territory are, many of them, very much encouraged. The Italian bees do not get diseased as quickly as do the black bees, and they stand it better when they do get diseased.

Diseased colonies of Italians, when very strong, and having a good, young queen, and the honey season is favorable, the disease does sometimes disappear of itself, but this is seldom. But the season has much to do with the progress and curing of the disease.

I find that bee-keepers have been much more successful in treating their bees and effecting a cure this year than ever before, on the territory where I have been working. Bee-keepers should not allow any colony to become weak and die or get robbed on their summer stand. All colonies should be kept strong during the summer, and in the spring and fall seasons the apiaries should be looked over, and all weak colonies removed from the apiary where disease exists.

Colonies treated for black brood, by shaking the bees into new hives (McEvoy method) should have plenty of young bees, and there should be plenty of honey in the field, or the bees should be fed with a syrup or good honey for some time after treatment. There is something peculiar about black brood; it does not show much with the first brood in the spring, but it will show more and more from May 1 to June 15. If the honey-flow is good after July 10 the disease in many strong colonies will begin to disappear, and by Aug. 1 will not show diseased brood, but often have a good, full brood of hatching bees, while other colonies go from bad to worse; these should be destroyed. Many apiarists have been studying various ways and means to bring about the best possible results and they are now very anxious to have the bee-inspector come and see their results, and have him instruct them and inform them of any new methods of treatment and the results in the hands of others.

I have faith to believe that we will have better times. Today the bees at Sloansville and Central Bridge, where the disease first started and was worst, the apiarists now have their bees nearly all cured, so the disease does not show very much at present, but it will break out some again in the spring. But those who are practical will take care of it. They get a very good crop of white honey, but not over half a crop of buckwheat honey.

The following is a report from the Department of Agriculture:

"Commissioner Wieting, of the State Department of Agriculture, under the provisions of Chapter 223 of the laws of 1899, appointed four agents to carry out the work of inspection of bees. Up to the present time the work has been mostly confined to a few counties where the diseases have been the most injurious to this great industry. The agents of this department are all experts in bee-culture, and have done a great amount of good work among the owners of apiaries, giving instruction on the subject, and especially suggesting remedies for the diseases. The Commissioner has had a bulletin prepared on the 'Black-Foul-Brood Among

Bees," and will send copies to applicants. A compilation of the reports of the agents since the work began on the first of May to the 21st of July, 1900, shows as follows:

Number of Apiaries visited.....	633
Number of Colonies examined.....	14,723
Number of Colonies diseased.....	4,689
Number of Colonies condemned.....	2,404
Number of Colonies destroyed.....	214

"The colonies destroyed were so badly diseased that no treatment could save them, and those condemned were simply set aside for treatment."

"The Commissioner will be pleased to receive letters from those in this State who have bees, and he is anxious to do anything in his power to increase the products of apiaries."

The names and addresses of the four New York State Inspectors of Apiaries are as follows:

M. Stevens, Pennellville, N. Y., for Oswego County.

Charles Stewart, Sammonsville, N. Y., for Fulton County.

W. D. Wright, Altamont, N. Y., for Albany County.

N. D. West, Middleburgh, N. Y., for Schoharie County.

All of these are anxious to do all they can to exterminate bee diseases and advance prosperity to the bee-keeping fraternity. N. D. WEST.

Pres. Root—This matter of black brood is before you. Perhaps before we go on to the general discussion we should hear from Mr. Stewart, one of the inspectors.

Charles Stewart, of New York—I don't know as I have anything to add to what Mr. West has said, except that we find throughout the locality where black brood is at its worst that it is a case of the survival of the fittest. As he said, the yellow race of bees is in much better condition than the blacks or the Carniolans. Then, too, it is a survival of the fittest among bee-keepers. Those who were negligent or careless have lost nearly all their bees, especially those who have black bees, while those who have the Italians, or even those who have the blacks, and have watched them carefully, have reaped a very nice profit during the past season, and their bees are in fine condition, also. I think the other inspectors will agree with me that the disease has not spread as it has formerly, owing to our work about April 1st, and our going about and cutting off all colonies that were weak, seeing that they were destroyed and put out of the way, and no robbing took place last spring, the result being that black brood has spread in my section but very little during the past season, and all who are practical bee-men are greatly encouraged and feel that they now have it under control, so much so that many talk of buying bees again and going back into the business.

Pres. Root—It is very gratifying to know that this disease is now being got under control, and I believe is now under control. A question I would like to ask is this: Do you have any difficulty in distinguishing black brood from foul brood, or is there a difference? and, if so, what is the difference between the two diseases?

Mr. Stewart—There is a difference, you will notice, particularly in the stage in which the brood dies. In the late autumn, foul brood—a large per-

centage of it—died after it was capped and was usually ropy or stringy. I am speaking now of foul brood. Black brood lacks that ropiness, and it dies before it is capped, the greater part of it, not much dying after it is capped. Occasionally you will find a combination of the two diseases, black and foul brood, or, again, a combination of black brood and pickled brood, and so we have sometimes a confusion of diseases, but the main difference between black brood and foul brood is the time at which the larva dies, and its ropiness; also that the black brood is much more contagious than the old-time foul brood. We sometimes find a place where they have had foul brood for five or six years, and, perhaps, it has not spread to adjoining apiaries; whereas, if it had been black brood, it would have spread over a whole county, showing that the black brood is much more contagious than the foul brood.

Pres. Root—Is it necessary to disinfect the hives in the case of black brood?

Mr. Stewart—We always advocate that, using corrosive sublimate or naphthalene, or something of that character, but it is possible to get rid of it by simply shaking them once on starters in the same hives, and they are healthy up to date; but this, perhaps, is not a wise thing to advocate among bee-keepers, because some of them are a little careless and they would not be successful, and we would be censured for it, so we advocate shaking twice and also disinfecting the hives. We think it is safer to be over-careful than not to be careful enough.

Edwin B. Tyrrell, of Michigan—Does the black brood spread in the same manner as the foul brood?

Mr. Stewart—It is spread by the honey being robbed from one colony by another, but sometimes it is spread we hardly know how. I have had an instance called to my attention in a locality where the bees were all healthy, you might say, and found only one or two cases; and within a short time a man that had a large apiary found combs of honey near him that somebody had thrown out for the purpose of infecting his bees. You may have an enemy, or someone you have never injured in any way, yet he feels that he has lost his own bees and is a little envious of you because yours are in a flourishing condition, and occasionally, it spreads in that way. It is something I dislike to mention, but it has been brought out and such a case will occasionally occur. But, if it is spread in some other way, because it will spread quite a distance, two or three miles, when you can discover no robbing. Possibly it is by drones. Possibly the germs may be carried by the bees to the flowers and other bees get those germs from the pollen. What we know we are able to tell you, but what we don't know, that is something no one can tell.

A Member—I would like to know something about the treatment.

Mr. Stewart—Our most successful treatment has been shaking them out to comb foundation, and in about four days taking those combs away and shaking the bees on to another set of starters, and by disinfecting the hive, or using another hive. The bees from that time on will be healthy unless they reach some infected honey.

F. J. Miller—Do I understand that it is simply the McEvoy treatment for foul brood?

Mr. Stewart—With the difference that we recommend being on the safe side by disinfecting the hive by boiling or the use of some strong disinfectant.

Mr. Case—How can you manage to get the bees from the combs or the starters on which you first shake them, on to the foundation that you are going to leave them on, without their killing themselves with the honey that is fed?

Mr. Stewart—That is a chance you have to take. Of course, it would, perhaps, be better to confine them in a box in the cellar until they have thoroughly used up the honey in their honey-sacs, and then put them on comb foundation. Of course, you will, occasionally, but the chance is small, have a colony infected by taking honey even a second time; that is why we use a second treatment, in order to do away with all the germs in the honey, and usually are successful, although once in a great while there may be an exceptional case; so, perhaps, it would be better to confine them in a box in the cellar for 48 hours, or something like that.

N. N. Betzinger, of New York—They usually retain the honey that they take with them 14 days before they let go of it.

Mr. Callbreath—What time of the year is best for treatment? Should the same treatment be given when they are gathering honey, as when they are not gathering honey?

Mr. Stewart—The better time is when they are gathering honey. In that case we recommend using something like formaldehyde in the honey.

Mr. McEvoy—I think that Mr. Stewart and I could agree on most points, but speaking of putting the bees into the cellar for four days, it kind of unfits them for business; they become lean and poor and have to be built up by feeding afterwards to get them into good condition. The four days upon the starters, and after that the new foundation will answer every purpose. There is nothing like feeding the bees; give them plenty.

Mr. Stewart—Yes, I do.

Mr. West—There is one thing in regard to this black-brood business, and with the treatment, and the shaking the first and second time, that I think is a little different in some cases from what it is with the real, old-time foul brood. Our black brood, when shaken the first time and let remain four days, and then shake them again, and put them on foundation, I find in the hands of other people who are doing this work, that the bees are very reluctant about staying in their hives so many times, and swarm out and sometimes go to the woods, and if this is done in the swarming season, when bees are swarming, they may swarm with other colonies that have a young queen, notwithstanding that these bees may have their queen caged. Notwithstanding all this, when other swarms issue, it has a tendency to draw these bees out of the hives and they unite on the wing and mix with other bees and thereby spread the disease to other hives. Now, I prefer, with a good many men that haven't real experience, to put them into the cellar and continue to feed them for four or five days. And

when I shake them on foundation and put them into the cellar for four or five days and feed them while they are there, I have had very good results this year; and if strange bees are put together, it improves the work, and I find, too, that the colony does better when treated in the swarming-time, if it is moved from the apiary some ten or twelve rods, out of the reach of the others. It is best, in my experience, to cure this disease in the swarming season, or when you have a continuous flow of honey, and if the colony, after shaking, has been carried off some ten or twelve rods from the rest of the apiary, when swarms from the apiary come out, the others are less inclined to leave the hive, and, if they do, and the queen is caged or clipped, they return without spreading the disease.

Mr. McEvoy—I agree with Mr. West on that point, when he puts them in the cellar he feeds them.

THE USE OF COMB FOUNDATION.

"Is the use of foundation profitable in the production of comb and extracted honey?"

F. Greiner, of New York—I would say that it is undoubtedly profitable to use comb foundation, in the production of comb honey as well as extracted honey, and the question in my mind is, Do we produce as good an article of comb honey with comb foundation as we could without? That is the only point why I hesitate sometimes in advocating and using comb foundation in sections. I have used the very best comb foundation that could be procured; and yet I will say that I did not use the flat-bottom foundation—there might be a difference in favor of that. I have used the regular comb foundation as it is manufactured by other manufacturers. I can detect the comb foundation in almost all my comb honey, and my wife very seriously objects to my using comb honey or bringing such in the house for use, on account of this comb foundation. Otherwise, I should say it was profitable to use. Of course, in the production of extracted honey, if you don't have the combs there is no other way. If you have not the combs, the way to do is to use comb foundation.

Dr. Mason—Wouldn't the bees build it if they didn't have any?

Mr. Greiner—They would, but it would not be as profitable, and we want as tough comb as possible. In the brood-chamber certainly it is profitable in more than one way to use comb foundation. You get splendid combs, and a good deal quicker, and the drones are excluded almost entirely; but there is no other way that we can prohibit the rearing of drones than by this method.

Dr. Miller—I don't doubt at all the importance of the question. I do doubt the advisability of taking much time in discussing the reasons for the differences of opinion. It occurs to me that if we could have two or three intelligent questions asked and simply get opinions how many think so and so; and it occurs to me that if Mr. Hutchinson, who has digested the whole matter pretty thoroughly, would put the different questions that are required, and ask us where we will put ourselves on record, I believe it would be of use. Simply get the number of those who

think they want to use foundation, and so on.

Mr. Hutchinson—Is it profitable in working for extracted honey, to have swarms upon full sheets of foundation in the brood-nest? How many would favor having swarms on full sheets of foundation in the brood-nest when working for extracted honey? Evidently, most of us use full sheets. How many would use full sheets for comb honey? How many would use starters? Is there any one here who would use starters in the supers only?

Mr. West—I would use starters, but I would make a half sheet of it by using it saw-tooth fashion.

Mr. Hutchinson—How many would fill their sections full of foundation? You see most of us would put in full sheets of foundation. Is there any one here that would allow the bees to build their surplus combs in producing extracted honey?

Mr. Wilcox—The foundation costs me nearly a dollar a hive, and by using a few sheets of foundation starters they will build a few combs, and it is more economical in the brood-chamber. I use old combs in the supers.

Mr. Betsinger—I voted for using full sheets of foundation in the sections. Now, I don't know anything more about it than before I voted. The question is *why* I use them.

Mr. West—We haven't got the time to tell why. We have got to take the expression in this way.

Mr. Hutchinson—I fill them full in my locality, because they can finish the combs so much quicker and take care of the harvest. I think if the honey-flow was slow it might be profitable to allow them to build combs in the sections, but when it comes in with a rush, and they can fill the super in three days, they haven't the time to build the combs and gather the honey, and for that reason it is profitable to use foundation, because they can get storage room quicker; but I have found it profitable not to use full sheets of foundation in the brood-nest when having swarms and working for comb honey, in my locality. I have taken the sections off the old hive and put them on the new, and have the same bees working in the sections again in 20 minutes, with all the enthusiasm of a new swarm, and all the honey that goes in must go up in those sections, and they will build brood-combs, and as fast as they build the queen will fill them with eggs, and I have gotten as nice honey as by allowing them to build their own surplus combs. But, as far as results are concerned in surplus honey, I can get more by allowing them to build their own combs in the brood-nest. I would confine a swarm to about five combs.

Mr. Abbott—As we seem to be establishing a precedent, I want to express my opinion about this voting business. It seems to me like school-boy play. I cannot see anything to gain by it, cannot see any instruction to be gotten out of it, and I cannot see any good in it—a lot of people holding up their hands that they would do this and that. A National bee-keepers' meeting, it seems to me, is to impart instruction and information at the same time, and to hear from these people who are not in the habit of talking. I want to hear Dr. Miller and we want to see him.

Dr. Miller—I think there are certain

things that we can get at a convention that we cannot get elsewhere, and this makes it worth while to come a long distance, and it is the men we don't see much of, it is the men whose writings we do not see much in the journals, that we want to hear from here. But there are certain things that sometimes have been discussed so thoroughly that we are not likely to get any new light upon them, but it is of very great importance to me to know something about what the bee-keepers in general do think about them. Now, if we were to have a long discussion about whether it is best to do this or that, and the reasons are given (and we have heard all those reasons before) there is more or less waste time in that. And it is worth while for me to know there are 37 who think so and so.

and 13 others who think differently. Of course, an old man like Mr. Abbott doesn't want us children to be playing here, but it is not child's play when we know what is the weight of opinion upon that. Then we can go on and get ideas that we will not get elsewhere.

W. L. Coggsall—What is the question under discussion?

Dr. Mason—We want to know whether the use of foundation is profitable in the production of comb and extracted honey?

W. L. Coggsall—Surely, it is indispensable.

Dr. Mason—Would you use it in the brood-nest?

W. L. Coggsall—Most assuredly.

Dr. Mason—Would you use it in the sections?

W. L. Coggsall—Yes, sir, full sections.

A Member—At what cost?

W. L. Coggsall—No matter what it cost.

D. W. Heise, of Ontario—I think Mr. Coggsall has almost settled this question. We can discuss this matter day in and day out and at the end of all the time it would resolve itself into the hive question. We know it is profitable to use foundation, and we know it from our own experience, and I think every one in his locality and according to his honey-flow will experience for himself whether it is profitable, and an expression from this convention by a show of hands that they all think it is profitable, gives me encouragement to do it myself.

Difficulties in Breeding for Long-Tongued Bees.

BY C. P. DADANT.

THERE has been considerable discussion of this subject for some time past in all, or nearly all, the bee-papers. There was a time when I loved a hot debate, and would throw myself head first into the battle on the side which I thought right. But that time has gone, and, although I still love to have my say, I much prefer to say it when the folks are through and the matter seems very nearly settled one way or the other. Yet it is much pleasanter to discuss bee-culture now-a-days than it was in years gone by, when each man thought those who did not agree with him on any particular question on the natural history of the bee must have a special spite against him. Hot words and epithets in scientific discussions are becoming a thing of the past.

The question of long-tongued bees is not new. When the Italian bees were first imported into American aparies, it was held by many that they could gather honey from the red clover, while the black bees could not. I remember an old neighbor who had bought Italian bees of us, when I was hardly yet a man, and came one day in great glee to tell us that his Italian bees were working on the second crop of red clover. "And," said he, "the black bees see them at work on it and try it, too, but they can't get anything out of it. Their tongue is not long enough." I went with him to see this wonderful performance, but it seemed to me as if both the Italians and the blacks were industriously at work and shared alike, for, although some bees seemed to fly about over the field without any result, others would stop long enough on a blossom to show that they harvested something. And this seemed to be quite uniformly the case with either race. And our old friend could hardly be relied upon for something very positive, as he was in the habit of readily believing what he earnestly desired. But, later on, I have seen, without doubt, many Italians at work in a field of red clover, while the blacks were totally absent. In that case there was either a difference in length of tongue or a difference in tastes and affinities. Yet the actual results in pounds of harvest could hardly be proven to the advantage of the red clover, for, even without red clover, we have always seen a better result with the Italian bees than with the black. But it can not be doubted that there is a perceptible tendency to longer tongues in the Italian race.

The discussion of the long-tongued bees will have the result of causing investigations in that direction, and breeding as much as possible from the bees showing the greatest disposition to harvest honey from flowers with long corollas, or from the breeds of bees producing the largest results. After all, is not this what we are seeking?

But, can we expect to get a set type, an invariable breed of long-tongued bees, readily? Can we make sure of a distinct race, in a word, upon which we may positively rely to harvest honey from red clover whenever the honey is in it? I think not. It seems to me that, handicapped as we are by the almost impossibility of controlling the selection of the male in the fertilization of queens, we cannot for a long time expect to duplicate our best breeders and produce an invariable race. But, aside from the difficulty due to this obstacle, we have also before us the tendency of all beings to return to the original type.

Those who have persistently worked for years—for a lifetime—to the change desired in breeds of horses, pigs, cows, chickens, and in fact in the improvement of any domestic animals, or plants, or trees, those men know how little can be accomplished in a single man's life. If you take a breed which has already well-marked traits in the direction you seek to follow, you can only hope to make a very slight improvement by years and years of persistent effort. Have any of my readers ever tried to produce a new kind of potatoes, or a new grape, by artificial fertilization? If they have they will remember how many worthless specimens they have brought forward, and how few good ones. Many of us have made such trials in the hope of producing something far ahead of our neighbor's stock, but how many disappointments?

So it must be with the bees, and worse, since we cannot control the reproduction as we control that of most of our domesticated animals.

But, nevertheless, it would be an error to discourage those who try, for they are certainly on the right road. It is not only by repeated trials and by selection, long-continued, constantly discarding the inferior subjects, and constantly keep-

FACTORY OF J. M. PAXTON, OF BROOKS CO., GA.—(See page 706.)

ing the same aim in view, that we can hope to produce fixed traits in our bees. And it would be well if we *all* tried, as those who keep in the rear only retard the others that much. That we can succeed, sooner or later, is evident, if we consider what has been done in other lines. Compare the Norman horse with the broncho or the Shetland pony; compare the Jersey with the short-horn cow; compare the Berkshire hog with the wild boar; the Bantam chicken with the Cochinchina or with the game fowl; compare any of our domestic animals with some different breed raised for a different purpose, or with the original progenitor of the race whose match still roams about the wild woods, and you will soon come to the conclusion that we can, with domestication and artificial selection, succeed in producing bees that will be far ahead of our present stock; but let us remember that before we secure fixed results, we will have many days of trial and many returns to the original stock, for we are only at the initial stage of bee-domestication.

An Experience with Black Brood in New York.

BY P. W. STAHLMAN.

SOME time ago I promised to report my experiments on black brood, the following being those of the past season. This is my third year with the disease. In the fall of 1900 I moved two colonies of black bees (apparently clean and free from any disease) from an infected apiary. Both were very successfully wintered out-of-doors, and the fore part April, 1901, the packing was removed and an examination made. Sealed brood in three combs was found in No. 1, and a few cells were rotten; No. 2 was found to contain some sealed brood also, but free from disease. The hives of the two colonies were about eight feet apart, and painted in two different colors to avoid any bees entering the wrong hive. Two weeks later another examination was made, and No. 1 contained a good many rotten larvae, while No. 2 was yet clean and breeding rapidly at this time. No. 1 was taken from its stand and all the bees shaken out; as an experiment, the bees were kept in the cellar about six days and fed with boiled honey. While this was going on, I cut from the combs of the same hive five pieces of comb about six inches square, on an average, containing neither honey nor pollen, and fastened these pieces of comb in a new hive, contracted to about five frames, and then turned the bees onto these combs, only to find about two weeks later, the disease again in its first stage.

I now took what few bees were left (perhaps two quarts or more) and put them on starters of comb foundation, and contracted to three frames, leaving them in the same hive, just as it was, and using the same frames, and all was well. I thus fed this small colony boiled honey every evening, and the disease never appeared again. This was taking bees from their winter quarters to treat them at once. Today (Aug. 19) the swarm is a "dandy," and I have installed a famous Italian queen as a safeguard for next year.

No. 2 bred up to contain nearly six frames of brood, but when I put the last outside comb, full of honey, in the center of the hive, the whole thing was struck with the disease, and, of course, had to be treated. The bees were shaken off the combs in front of their hive, on a large newspaper, and as soon as they crawled into the empty hive the newspaper was burned. In all cases the shaking was done at nightfall. The colony was left to work at liberty for four days, and then, without smoke, the hive containing bees (which contained no frames) and what comb they had built, was quietly set on the ground and a clean hive containing starters, *à la* McEvoy, was placed on the old stand, and then the bees were suddenly jarred out of the box and were left to enter the prepared hive and go ahead.

All was well for about seven weeks, when, from some cause or other, the disease again began to appear. After a few days the colony, which was strong, was again treated in the same way, and today, after seven or eight weeks, all is clean and good. The combs were cut out and destroyed, brood, honey and all, and two tea-kettles of boiling water was poured over the frames and hives, giving it a thorough scalding, and, on July 16, No. 3 (being also a treated colony that a friend had given me, and which I had treated in the same manner) cast a swarm. This swarm was hived on these scalded frames, with starters, the same cover and bottom-board being used, and today all four colonies are healthy and populous, open for inspection to any one, as the season was especially good for experiments.

It has been a wet season, and not of the best for honey. My colonies, four in number, are now headed as follows: No. 1, a queen from Kentucky; No. 2, one of a California stock; No. 3, a daughter from the Kentucky queen, and No. 4, a

Carniolan. By this I mean to keep them free from disease next year, and increase my colonies. It takes Italian bees to fight black brood. Black ones are "no good."

Questions and Answers.

CONDUCTED BY

DR. C. C. MILLER, Marengo, Ill.

(The Questions may be mailed to the Bee Journal office, or to Dr. Miller direct, when he will answer them here. Please do not ask the Doctor to send answers by mail.—EDITOR.)

Wintering Bees on the Summer Stands.

I wish to ask about wintering bees on the summer stands. I have the "Langstroth on the Honey-Bee," but I can't find much about wintering bees on the summer stands in it. I am going to winter two colonies on the summer stands; they are eight feet apart and have plenty of stores; they are in eight-frame dovetailed hives and I have wintered them in the cellar two winters. How must I pack them and when? The winter here is usually cold, sometimes 30° below zero. Last year I put the bees into the cellar Nov. 26, and took them out Apr. 2. The hives face south. What shall I pack with?

MINNESOTA.

ANSWER—You must have overlooked what is said in Langstroth, beginning at page 326, and especially pages 336 to 344. If you have always been successful in cellar-wintering, it is doubtful that you can do better outdoors. The packing should be done early enough so that they will not suffer from any very severe freezing. Langstroth recommends for packing material, chaff, straw, forest leaves, woolen rags, and corkdust. The last is probably the best, but it is not always easy to be obtained. Planer-shavings are quite popular, and are not generally difficult to get.

Introducing Queens.

A queen I ordered some weeks ago arrived in good condition. I introduced her according to directions, the colony being queenless one day. After 24 hours the bees had done nothing to the cage, the weather being rather cold; so I pulled off the card at the end. The following day, it being still colder, the queen was still in the cage, and almost frozen. I then took her out and dropped her among the bees. A few days ago I examined the hive but found no queen, eggs, nor sealed brood. Was I at fault in my way of introducing, or how do you account for the disappearance of the queen?

OREGON.

ANSWER—Were you entirely certain about the disappearance of the queen? Many a time has an experienced beekeeper looked in vain a long time without finding a queen, especially a queen that is not actively engaged in laying. Of course, you may now be sure, some weeks later, for if present she would be laying. Dropping an almost frozen queen among the bees was hardly the wisest thing. From what you say it would appear that the queen was more or less separate from the bees, otherwise she would not have been chilled. The result probably would have been different if you had put the cage right in the cluster of bees so that there would be no question as to warmth, and then at their leisure the bees would have liberated the queen.

Baked Sweet Potatoes for Bees—Finding Black Queens.

1. Are baked sweet potatoes good bee-food? They are almost entirely sugar and starch, and the bees eat great holes in them.

2. Is there any way of finding the queen in a colony of black bees besides shaking them all off the combs in front of the hive protected with a queen-excluder? I have hunted mine over a hundred times and never could find one.

3. Why are queens dearer in the spring than in the fall?

LOUISIANA.

ANSWERS. 1. I don't know. I should suppose they might answer a very good purpose if consumed while bees are actively flying, but they might be bad for winter stores.

2. The usual way is to look over the combs till the queen is found, and I suppose that is the way you mean you have done a hundred times over. After you have looked over the combs two or three times without finding the queen, it is hardly worth while to continue. Close up till some future time, not sooner than half an hour, and you may then find her the first thing. Another way is to put the combs in pairs. Put two of them into an empty hive, the two close together but an inch from the wall of the hive. Put another pair at the other side of the hive. Dispose of the rest in the same way, using another empty hive, only leaving one pair in the hive on the stand. Now look at the first pair, lifting out the frame nearest you. If the queen is on either of these combs, you may be sure she is on the side next the other comb, so as to be out of sight as much as possible. As you lift out the comb glance over the side of the comb left in the hive, and if you do not see the queen on that comb look quickly at the comb in your hands on the side from you. If unsuccessful in your search through the different pairs, let them stand for a time, and you will find the bees showing signs of uneasiness when the queen is missed. The pair that has the queen will remain quiet, and your search will now be brought down to those two combs.

3. Like other commodities, the law of supply and demand affects the price of queens. Queens are plentiful in the fall; it is easy to have them in nuclei, and it is not easy to winter them except in full colonies.

Queens Killed in Introducing Saving Queenless Colonies.

1. About Sept. 5 I ordered half a dozen queens, but did not get them until the 28th. The breeder sent no directions for introducing, so I followed as closely as possible the directions in the "A B C of Bee Culture." I put in five queens, one being dead when received; 48 hours after I put them in I looked in and found a lot of queen-cells which caused me to feel uneasy, and I examined the front of the hives and found two dead queens. I think all the others were killed, as there were cells in each hive. Why was it they were all killed? The bees had a good lot of honey and were getting honey from asters.

2. What can I do at this season of the year to save the queenless bees? VIRGINIA.

ANSWER—1. It is impossible to tell what may have caused the loss without more particulars, and it is not certain that full particulars would allow an answer to be given.

2. You can buy queens to introduce to the queenless colonies, and as they will have been queenless a considerable time they ought to accept queens readily. If, however, they have reared young queens already, they will make trouble. It is possible you have colonies with laying queens that are weak in bees, and it would be a profitable thing to strengthen them with these queenless bees.

MONUMENT FOR THE BEE-FLY-ESCAPE IDEA.

But Mr. Alpanzh's adaptation of the bee-escape to keeping a room clear of flies—that seems to have gotten beyond theory to practical success. Who knows but we shall sometime vote him a monument for that? And he needn't use the monument for a good long spell yet, either.

MELTSE, HONEY, TUBS, ETC.

Yes, and do you see that not only Dr. Strickland, of Tennessee, but also the Battle Creek Sanitarium, of Michigan, are pushing meltse as a substitute for honey? Well, "Every tub on its own bottom," but the venders of the good old tub need hardly be expected to lead in singing hallelujahs to the poor new tub. Page 611.

CONDUCTIVITY OF HONEY.

Honey is *queer* about its conductivity. Perchance it is partly because of the speed with which both the absorption and exhalation of water from it goes on. If we try to cool warm honey, recently cooled air (practically sure to be damp)

at once envelops the surface. Surface seizes the vapor, and in changing it from gaseous to liquid condition sets free the latent heat—practically manufactures heat. If we try to heat cold honey we are liable to find that a thin film at the surface has got very thin in the other sense of the term. This liquid water rapidly changes to vapor of water (providing we apply the heat to the surface) and so practically manufactures cold at a rapid rate. The amount of heat which an ounce of water vapor will change to the latent state, and so cause to disappear, is great almost beyond belief. And that may be in part the how and the why of it that it takes such an amazing spell to get cold combs fit to extract. Hang them far apart—up to the top of the room—and give them two days if you possibly can spare it. Another good way is to extract what you can while in a half-warm condition, warm them some more, and then extract again.

WATER AS A CONDUCTOR OF HEAT.

"Water, if kept from circulating, is as bad a conductor of heat as eider-down." That's a big sentence. Better we keep it on probation awhile before we swallow it whole. An ounce of water distributed in the chaff of a cushion is pretty effectively kept from circulating. Would it, or would it not, affect the cushion like mixing in an ounce of eider-down? I'll choose the down for my bees. But when it comes to honey, I'll admit without argument that honey is a poor conductor—and the lack of mobility in its particles helps it to be so, very likely. Page 613.

POSITION OF BEES IN WINTERING.

"Observer" does well to call our attention to the fact that wintering each individual bee in a four-inch cluster must furnish heat twice as fast as a bee in an eight-inch cluster. Also we have thought that spacing the combs a little further apart for winter was a help. I, for one, feel about ready to tumble to his argument that it is not a help, but a disadvantage. But the case of bees massed in a "Hill's device," with their backs up against a warm, dry cushion, and getting honey from below—"Observer" does not handle that case. I should say. Page 613.

BULK COMB HONEY VS. SECTION HONEY.

Mr. O. P. Hyde, bees do not create honey out of nothing. If your bees store twice as much bulk comb honey as of section honey it must follow that somehow or other, actual or potential, there is a waste of one-half by the section-storing bees. That's not the way bees do at my yard. Yet I'm not sure but *some strains of bees* will do just that when you try to get them to work in sections. Page 616.

CRABBEDNESS AND DYSPEPSIA.

"Zatso." Prof. Cook? Does crabbedness breed dyspepsia? The popular impression is that dyspepsia breeds crabbedness. Perhaps the bottom fact is that they mutually foster each other. Page 618.

SCREEN HIVE-TOO AS A ROBBER BOTHERER.

Take off the cover of the hive, and fasten on the screen top as if for moving. We had several excellent devices to bother robbers before, and this evidently adds another. Good plan to "have our quiver full of them"—and wit enough to select quickly the right one to shoot in sudden need. Page 621.

THE QUEEN AND LAYING OF DRONE-EGGS.

The sharpness of the queen's desire to have some drone-comb to lay in is alluded to by Mr. Atchley, on page 630. Probably many of us have noticed this. He thinks the queen finds it easier to lay drone-eggs. How about the probability of that, brethren? If not the precise fact, I think it at least a near approximation. May be supposed that a sort of nerve-exhaustion has been run up by the long laying of myriads of fecundated eggs, and that the laying of unfecundated eggs does not make so large a demand for nerve force, nor exactly the same kind of a demand. She is taking a rest not by quiescence, but by change of action. Even ye sapient editor may write, and write, and write, until it is a rest to saw dry hickory wood. Howsoever, it is also imaginable that the queen stops laying worker-eggs simply because there are no more spermatie particles ripe enough to use.

Our Wood Binder (or Holder) is made to take all the copies of the American Bee Journal for a year. It is sent by mail for 20 cents. Full directions accompany. The Bee Journals can be inserted as soon as they are received, and thus preserved for future reference. Upon receipt of \$1.00 for your Bee Journal subscription a full year in advance, we will mail you a Wood Binder free—if you will mention it.

* The Home Circle. *

Conducted by Prof. A. J. Cook, Claremont, Calif.

KINDLY INFLUENCE OF FLOWERS AND BEES.

I want to thank Prof. A. J. Cook for the "Home Circle" in general, and in particular for what he said about flowers, on page 634. The ladies—wife and daughter—of this ranch are great lovers of flowers, and have about 40 plants of different varieties in the house; but I never thought flowers had any particular moral effect on the behavior of our farm dog—a thoroughbred shepherd (15 years old now), that has always been very strict about keeping the other animals about the farm out of mischief, and keeping all strays from intruding on the premises; but it is a fact that he never barks at people when they turn into our yard; on the contrary, he always goes out to meet them, wagging his tail, to strangers as well as friends, as much as to say, "That is right; come right in; you will find a welcome." He even allowed a thief to carry off a super of honey from my apiary one night a few years ago; but I don't want that trait of his to be known very widely.

Instead of giving flowers the credit of "begetting a more kindly, genial spirit," I have been inclined to come at it from the other way, that people who are naturally kind-hearted and genial, exerting themselves to cultivate those traits, are the ones who, most naturally, take to flowers. It doesn't matter which way you take it, the influence is good both ways.

But what about bee-keeping and the influence for good that the "busy bee" exerts over those who engage in that business? It may be a little on the order of "compulsory education," but it is certainly a great school in which to learn patience and self-control—elements very essential toward the possession of a "genial, kindly spirit." Who ever knew a bee-keeper and real lover of bees who lacked these traits? As a rule, I find them the most sociable people I meet; even though perfect strangers to each other, it does not take long to get acquainted when it is known that each is engaged in keeping bees. There seems to be that fraternal feeling existing between bee-keepers that does not obtain with people of almost any other calling.

I got out my paper and pencil to make a report of my doings with the bees the past season, but my mind persisted in running off that track, all on account of that article of Prof. Cook's, consequently my report will have to wait.

Mitchell Co., Iowa.

A. F. FOOTE.

INDIO, THE SUBMERGED.

There is a very curious thing about the soil of California. Dr. Hilgard—the distinguished scientist of our State University—puts it very graphically. He says that we have several farms, one under the other. He means that our soil is fertile away down. If we should bring a four foot soil to the top it would be immediately productive; or, if we would expose a soil four or five feet down, by removing the top soil to that depth, it would at once grow—if watered and cared for—a full crop of grain. This is why California is so immensely rich in its soil. It is an arid region and the soils have not been leached of the valuable fertilizers.

Where I now live, illustrates this truth. When I came here I graded my lots. I cut down two feet or so at one place. I commenced removing the surface soil as I would have done in Michigan, moving it to one side, expecting to return it when I had the grade to my liking. A neighbor, seeing my work, queried as to my purpose. I explained, when he told me that I need not take that trouble; that the subsoil and sub-subsoil, etc., were equally fertile with the topsoil. I acted on his suggestion, and though I planted a part of my lots on this sub-subsoil, yet all my neighbors have wondered at the marvelous growth on my lots. A white clover lawn right on this undersoil took full shape, vigor and beauty in three months. Tacomas, two years from planting, cover the whole front to the very roof, and are the admiration of passers-by. Thus, an apparent desert, if watered and cultivated, will show marvels of plant growth and vigor.

This is a good preface to a write-up of wonderful Indio. It is a little over 100 miles east of Los Angeles, and is 20 feet below the ocean level. Thus I spent two days recently beneath the horizon. Yet it is not in the extremest depths. Salton, a few miles farther east, is many feet lower. This

was all, not long ago, covered with the "mad sea waves," and so, as the country around was raised, rich deposits, as well as those poisonous to the plant life, were left stranded on the desert sand. Lower Salton has since received the washings from Indio and the other higher areas, and so they are emptied of their salt and other alkalis, and are now immensely productive. Indeed, could we be sure that these higher acres were entirely cleansed of the noxious salts, we could buy land at Indio and know that we were getting a veritable garden. Indio is only a yearling. A year ago it was a bleak, arid desert, only known as an eating station on the "Espee" railroad. A little more than a year ago it was discovered to be an artesian valley. Wells were bored at slight expense, and a great flow of the most beautiful water was the result—wells costing but \$300 or \$400 gave, in some instances, 40 inches of water. The water is said to be of the very best quality.

The climate at Indio is, in summer, exceedingly warm—118° Fr. in the shade being not exceptional. Yet it is so dry that people do not mind it, and those suffering with pulmonary troubles find here a paradise. The microbes of tuberculosis find this place too hot, "throw up the sponge," and their victims rejoice in new found health and vigor. Thus we

PEARS IN CALIFORNIA—(See page 706.)

see that Indio is a veritable green-house, a plant conservatory. Cantaloupes and water-melons grow here in a perfection that makes Rocky Ford, Colo., envious. Oh, but they are sweet and delicious! Melons just like the dry heat of Indio, and, if well watered, give a sugar content that makes them savory beyond compare. They come into market in June and July and thus antedate all other regions, except it may be Florida, and when it comes to quality, Florida simply "is not in it." Last year—Indio's first year—she sent 2,300 carloads of this luscious pulp to market, mostly to Chicago. The crop sold for upwards of \$25,000, and the cultivators received over \$10,000. Single acres produced, it is stated, over \$250 worth of these incomparable cantaloupes.

Here, as elsewhere, the traffic took all she dared to. But with reasonable traffic rates, we see that Indio has a great prospect ahead. Even with the present exorbitant express charges, the returns were most encouraging. If alkali does develop—and the Lower Salton region and the excellent water makes this danger improbable for much of the section—then Indio, so late a desert waste, will in the future be prized as a most valuable agricultural section. We had a two days' Institute in this yearling town. The people are bright, intelligent, and full of hope and enthusiasm, which latter we visitors caught in good measure.

I am glad to give this picture, as it makes us all in love with our grand country, more to marvel at its inexhaustible resources. If the veriest desert can blossom out with scores of carloads of cantaloupes, what may we expect when our

water systems are fully developed? Let us talk around the home tables, at the social meet, on the street corner, everywhere, in favor of more energetic action on the part of the government to conserve and develop our invaluable water-supply.

JOSEPH AND HIS BRETHREN.

Wasn't that Sunday-school lesson of yesterday a most interesting one? A divided home, a partial father, a proud boy, and envious brothers. No wonder all this gave birth to bitter rancor and hatred, and stayed not until murderous intent against a brother stole into those jealous hearts. Aren't we glad that we have so many homes where discord is not known? Isn't it good that Uncle Sam set his great, splendid foot on polygamy in our fair territories? Don't we all rejoice that the Christ spirit is so rife among us that partial fathers and mothers are rarely found? All the children in the most of our homes receive the best that is to be given by fond, loving parents. Can we give too much thought, study, or even money, if it tends to cement the love of brothers and sisters

for each other? No doubt, Jacob's misdeeds and trials developed a character that has enriched the world. We believe that even Joseph, as true and chaste as he was, was ennobled by his great trials. That trials and afflictions may have a most blessed ministry in the building up of a proud character, who can doubt?

MOCKING-BIRDS.

The mocking-bird is one of our delights. Closely related to thrush and cat-bird of the East, it out-sings either. Ours is the very same that charms the bird-lovers of the Carolinas. It sends out its sweetest carols morning, noon and night, and even at midnight it wakes to sing. Its heart is full as it watches its little fledglings. Five growing, promising little birdlings! No wonder the wondrous song makes musical the very sunshine, and gladdens all our hearts. I rejoice that my evergreens, down by the barn, are so vigorous. Soon they will harbor more of these lovely singers. A happy pair, in these October days, give us lovely music the entire day through.

Red Clover Queens FOR 1902 Free

Long-Tongue Variety—Warranted Purely Mated.

We have already arranged with the queen-breeder who furnished Long-Tongue Red Clover Queens for us during the past season, to fill our orders next season. Although fully 95 percent of the untested queens he sent out were purely mated, next season all that he mails for us will be warranted purely mated.

We want every one of our present subscribers to have one or more of these money-maker Queens. We have received most excellent reports from the queens we supplied during the past season. And next year our queen-breeder says he expects to be able to send out even better Queens, if that is possible. He is one of the very oldest and best queen-breeders. His bees average quite a good deal the longest tongues of any yet measured. The Breeder he will use is direct from Italy, having imported her himself. Her worker-bees are large, of beautiful color, very gentle, scarcely requiring veil or smoke.

Orders for these fine, "long-reach" Warranted Queens will be filled in rotation—"first come, first served"—beginning as early in June as possible. It is expected that orders can be filled quite promptly (even better than the past season), as a much larger number of queen-rearing nuclei will be run. (But never remove the old queen from the colony until you have received the new one, no matter from whom you order a queen).

All Queens will be guaranteed to arrive in good condition, and will be clipped, unless otherwise ordered.

A Warranted Queen for sending us Only 2 New Yearly Subscribers

In order that every one of our subscribers who wants one of these Warranted Queens next season can easily earn it, we will book your order for one queen for sending us the names and addresses of two new subscribers to the American Bee Journal and \$2.00. FURTHERMORE, we will begin to send the Bee Journal to the new subscribers just as soon as they are received here (with the \$2.00, and continue to send it until the end of next year, 1902). So, forward the new subscriptions soon—the sooner sent in the more weekly copies they will receive.

This indeed is an opportunity to get a superior Queen, and at the same time help swell the list of readers of the old American Bee Journal.

We are now ready to book the Queen orders, and also to enroll the new subscriptions. Remember, the sooner you get in your order the earlier you will get your Queen next season, and the more copies of the Bee Journal will the new subscribers receive that you send in. We hope that every one of our present readers will decide to have at least one of these Queens.

Fairly Good Season.

Bees did fairly well the past season, considering the drawbacks. White clover did not amount to anything. I had 40 colonies, spring count, and increased to 60, and have taken off, up to date, 2,084 pounds of honey. 1,700 of which is comb. I have sold most of this from my honey-room, at 12 and 15 cents per pound. I kept further increase back by caging the queen in the parent colony. After 9 days I destroyed all cells, and then released the queen. Honey is what I am after, not bees.

Marshall Co., W. Va., Oct. 21.

Purity in Queens.

I saw an answer to my article on page 529 as to the purity of drones. Mr. Hasty, on page 617, does not understand me. I said that I did not believe that a queen that would produce black and golden drones was pure, yet he goes on to say that wild birds are pure, yet the male, in many cases, is brilliant in color, while the female is plain looking. But suppose we take lots of our White Leghorn chickens that are pure, and we will then produce white chickens still. What I meant was that our bees will, if pure, produce either golden or black drones, and not two kinds from the same mother. I meant that if our queens and bees are three-banded, then our drones should be one color. I am not after three-banded queens, but I wanted to know if it could be possible that they were pure.

Fannin Co., Tex., Oct. 16.

Honey Crop Not Extra.

The honey crop has not been very extra here. I got 1½ tons from 43 colonies, spring count, only 500 pounds of this being comb honey. "The Home Circle" is very delightful reading.

Chatsop Co., Oreg., Oct. 21.

Poorest Year in Seven.

This has been a very poor year for bees in this part of the country. Although reports have been good, I fear they have been made only to keep the price of honey down. I have 180 colonies, and had 12 swarms the past season. I have extracted once and got only 12 cases, and will not have half a crop this year. I am in one of the best localities in the county. I have kept bees for seven years and this has been the poorest we have ever had. I have taken the American Bee Journal for one year, and like it very much.

W. M. WILSON,
Tulare Co., Calif., Sept. 10.

Where Bumble-Bees Winter—Poor Season.

On page 108, I notice a letter from Thomas Wallace in regard to bumble-bees in winter. I suppose the majority of people think they go South, but I do not agree with them. Last spring I was grubbing stumps, when I found proof to the contrary. I found one nearly 14 inches below the surface of the ground. I caught it by the wings when it started to "cseee," like all bumble-bees, and in 15 minutes it flew away. I found them the same way the latter part of September. The first thing bumble-bees work on is the alfalfa, clover, and I have not seen them fly until that bush is in bloom.

The hornets, also, winter between the bark of old, rotten trees, for I have found them there very late in the fall. They were weak, the same as the bumble-bees. I think they must winter here, the same as grasshoppers, snakes, toads, frogs, etc., which are never seen in winter. Last winter I found a snake which was covered with a few leaves, where I was chopping cord-wood. I cut it in two with

(Exact size of the Pen)

the ax, but there was no life in it; but just as if you would cut a sausage in two. So I think the bumble-bees must winter here. If not, I think it would be quite a hop for the frogs, toads and grasshoppers. I have noticed several times, when in the timber on a warm day, that the grasshoppers, spiders, flies and other insects, could be seen flying and hopping around me; and I have seen them as early as March 2, before the frost was out of the ground.

I would like to know if any of the readers of the American Bee Journal can explain where the frogs and toads winter. I opine that they go deep enough into the ground so that the frost can't reach them.

I had poor luck with my bees last winter, as all froze to death. I now have three colonies in good condition, and am hoping for a better crop in 1902. 1900 was the poorest year for bees since 1894. It was too wet. The roads were not fit for a rabbit to cross, for I have more money than one stuck in the mud. One of my calves, even, got stuck, and in trying to help it out, I got stuck myself.

I receive the "old reliable" American Bee Journal every Thursday, and it is a welcome visitor.

B. F. SCHMIDT.
Clayton Co., Iowa, Oct. 12.

Catching the Bee-Moth.

I saw in the Bee Journal an item from A. E. Stone, of Arkansas, about bee-moths. I set a lamp in a dish-pan of water; the lamp attracts the miller, which flutters about the lamp until it falls into the water. This pan and lamp are set in such a part of the house (with open door) so that the lamp, turned to a dim light, reflects a little towards the place where my bees are located, so that the light does not reflect to the front or entrance. It is surprising what a difference it makes if done at the first appearance of the moth in the spring.

L. L. MILLER.
Wyandot Co., Ohio, Sept. 27.

Poor Season for Bees.

We had a very poor honey season the past summer. I got very little honey, and had to feed my whole apiary to bring them through the winter, as we had no fall flow. Being very busy cutting my corn and seedling my wheat crop, I neglected my bees when they needed attention, and lost half a dozen colonies. A great many colonies in this locality, I think, will starve this fall and the coming winter.

L. A. HAMMOND.
Washington Co., Md., Oct. 14.

The Vetch as a Honey-Plant.

I read an article in the American Bee Journal about hairy vetch. I have raised both the winter and the spring vetch, and both kinds are very valuable plants for stock. But the spring vetch beats the hairy, for cattle and horses like it better, green or dry, and the bees are thicker on it if they have their choice of both. I have never seen a been on the flowers of the vetches. They always go on the stems, generally between the stem and leaf. They are after the sap. While the bees are very thick on the vetches, the hives do not gain in weight. It only keeps them busy, but rearing very little brood meanwhile. That is the experience I have had with vetches. I have two acres of them, and 60 colonies of bees.

J. HILLIER.
Pierce Co., Wash., Oct. 2.

Bee-Keeping and Poor Health.

My health being poor, I thought I would try bee-keeping, so Oct. 10, 1899, I bought five colonies in Baldwin hives. The size of hive 14½ by 17½, and 11 inches deep, inside measure. It is an odd size. In the spring of 1900 I heard of the American Bee Journal and sent for a copy. In it I saw bee-books advertised, and so got "A B C of Bee Culture." But I let the bees have their way. They did not swarm, and I got 211 pounds of comb honey from two of the colonies, and nothing from

the rest. Last spring I still had five colonies, and the first of May I overhauled them. The two colonies that gave me the 211 pounds last year had each a nice yellow queen and a fine lot of brood. The other three were dark in color, and had no brood started; I think they were old bees. I took one of the yellow queens and three frames, and put them into another hive. I soon had a fine lot of cells started in the hive I took the queen from. I killed the three dark queens, and the second day I gave these colonies a queen-cell each in queen-cages. In two days they had hatched, and I released them. In 15 days they were laying and I clipped them. The other colony I reared drones from, not allowing any other to rear them. This one gave me a nice swarm on May 26. It is now filling its third super of 24 4x5 sections. I have increased to 13 colonies by dividing, with the exception of the swarm spoken of. They are all doing nicely and storing in the supers. I think it has paid me well to take the American Bee Journal and to have the "A B C of Bee Culture," and I feel proud of the pocket-knife I got with the Journal last spring—it is all right. I want to say that any one keeping bees makes a mistake if he does not take some good bee-keeper.

JACKSON CO., Mo., Sept. 2.

The Beet vs. Cane Sugar Question.

This is one which seems quite unwilling to stay settled. The following editorial upon the subject is from *Gleanings in Bee-Culture*:

I have received a letter from Mr. Thomas Wm. Cowan (now sojourning in California), editor of the British Bee Journal, and who, through the columns of that paper, has recommended cane in preference to beet sugar for the feeding of bees. In a letter just received, he writes:

DEAR MR. ROOT:—I have just been staying at a fruit-cannery in the Santa Cruz Mountains where they use nothing but guaranteed cane sugar for canning purposes, and their experience with beet sugar is very similar to ours in England. It may be that the humid climate may have something to do with it; but it is quite certain that beet sugar is bad, not only for bees but also for preserving fruits in England. I suppose in the laboratory it is possible to get perfectly pure cane sugar from beets so that, chemically, it would be identical with that obtained from sugar cane, but in practice it is found that there are certain

BEST

Extracted Honey For Sale

ALL IN 60-POUND TIN CANS.

Alfalfa Honey

This is the famous White Extracted Honey gathered in the great Alfalfa regions of the Central West. It is a splendid honey, and nearly everybody who cares to eat honey at all can't get enough of the Alfalfa extracted.

Basswood Honey

This is the well-known light-colored honey gathered from the rich, nectar-laden basswood blossoms. It has a stronger flavor than Alfalfa, and is preferred by those who like a distinct flavor in their honey.

Prices of Alfalfa or Basswood Honey:

A sample of either, by mail, 10 cents, to pay for package and postage. By freight—two 60-pound cans of Alfalfa, 8 cents per pound; four or more cans, 7½ cents per pound. Basswood Honey, ½ cent more per pound than Alfalfa prices. Cash must accompany each order. You can order half of each kind of honey, if you so desire. The cans are boxed. This is all.

ABSOLUTELY PURE HONEY

The finest of their kinds produced in this country.

Read Dr. Miller's Testimony on Alfalfa Honey:

I've just sampled the honey you sent, and it's prime. Thank you. I feel that I'm something of a heretic, to sell several thousand pounds of honey of my own production and then buy honey of you for my own use. But however loyal one ought to be to the honey of his own region, there's no denying the fact that for use in any kind of hot drink, where one prefers the more wholesome honey to sugar, the very excellent quality of alfalfa honey I have received from you is better suited than the honeys of more marked flavor, in my taste.

McFerry Co., Ill.

C. C. MILLER.

Order the Above Honey and then Sell It.

We would suggest that those bee-keepers who did not produce enough honey for their home demand this year, just order some of the above, and sell it. And others, who want to earn some money, can get this honey and work up a demand for it almost anywhere.

GEORGE W. YORK & CO., 144 & 146 Erie St., Chicago, Ill.

potash salts in sugar from beet which do not occur in those from sugar cane. Leather and beefsteak have chemically the same composition, but there is a difference between them. TIOS. WM. COWAN.

It may be possible, as Mr. Cowan suggests, that the humid climate of England may have something to do with the matter. If it is not too much trouble I should like to have him give me the address of the cannery to which he refers—not that I in the least question his word, but because I should like to get a detailed statement from them, explaining why their experience with beet sugar has not been satisfactory.

California vs. Australia for Honey.

Why there is so much more honey produced in California than Australia, and why a much larger number of hives can be kept in one place there than in Australia—in Australia the highest mountain does not reach 8,000 feet, while in California they attain an altitude of from 16,000 to 18,000 feet. The white sage of the valleys precedes the black sage of the canyons, and the bees commence working in the valleys and then gradually fly higher up as the blossoms climb the mountain sides. It gives a much longer honey season than in regions not so mountainous. There is another fact that greatly extends the period of bloom in California—many flowers, like the white sage, are in long racemes which bloom centrifugally, that is, the outside flowers, or the lower ones, blossom earlier than the upper. This, of course, greatly prolongs the period of bloom and, consequently, the honey season.—The Australian Bee-Bulletin.

Tarred Paper for Packing.

Last winter I had two colonies, each in a ten-frame dovetailed hive, with a half-story (full of saw-dust over the enameled mat, and the whole hive from the under edge of cover to the ground surrounded by a single thickness of tarred paper. This was secured by strips of wood tacked around where the paper lapped. The entrance, of course, was left open. The results were all that could be desired. The two colonies wintered perfectly, were strong in bees, stores sound and combs dry, and were the first to have supers put on. So well pleased am I with the results that I shall try the experiment on a larger scale this fall.

The tarred paper is virtually air-tight, at least it is wind and water proof; but when the sun shines on it its blackness causes it to absorb much heat. I often saw bees at the entrances of these hives when none could be found stirring in any of the others, and during the winter months I began to fear that the results would be disastrous, but they were quite the contrary.

Of course, this is only with two hives for one winter, and it is not safe to put too much dependence on the method until it has been more extensively tried.—A. C. MILLER, in the American Bee-Keeper.

Uniting Bees for Wintering.

A friend inquires of G. M. Doolittle as to the best way to unite two or more weak colonies for wintering. The following conversation upon the subject is given in cleanings in Bee-Culture, Doolittle being the first speaker:

"Well, I will tell you of a plan I have used successfully for a score or more of years. The first thing to do is to place an empty hive where you wish a colony to stand; and if you can allow that to be where the stronger of the weak colonies is now standing, so much the better, as in this case the bees from this one will not have any desire to go to any other place, as this is where they have marked their old home."

"But how can I set an empty hive there when the stand is already occupied?"

"If you do this work as you should, on some day when the bees are not flying, and yet when it is not cold enough to chill bees generally, say on some cloudy day, or near sundown, when the mercury stands at from

50 to 55 degrees, you will have no trouble in setting this stronger colony to one side of its stand, and taking your time in arranging the empty hive thereon."

"Yes, I see now. But go on."

"Having the empty hive arranged, go to the several hives having the colonies which are to be united to form one colony, and blow quite a volume of smoke in at the entrance of the hive, at the same time pounding with the doubled-up hand, or with a stick, on top of the hive."

"What do you pound on the hive for?"

"This pounding on the hive causes the bees to fill themselves with honey, upon which filling depends the successful uniting of bees."

"How long should I pound?"

"I pound on them for about a minute; sometimes two, if it has been cool for some time before, so the bees are quite compactly clustered as in this case it takes them some time to cluster and fill themselves."

"Do you keep on smoking all the time you are pounding the hive?"

"I smoke only enough to keep the bees from coming out after the first few voluminous puffs. As soon as you are through with the last one, take a wheelbarrow and wheel the hives to where you wish the united colonies to stand, which wheeling helps, by its jarring, to augment the fear of the bees, thus causing them more effectually to fill themselves with honey. After this wheeling them together, do not delay in opening the hives, else the bees may disgorge their load of honey back into the cells again."

"Would not an assistant be good at this time?"

"One would do no harm; but I generally do this work alone. Having all near together to the hive they are to go in, open the hives and take a frame of comb and bees from one hive and place in the empty one; then take a frame from the next hive, placing it beside the first, and so keep on alternating the frames from the different hives till the empty hive is filled. In doing this, select such combs as you desire, either for brood, honey, all-worker comb, etc., thus putting in the honey in the best combs. Having the hive filled with comb, close it, when you will next take a frame from the first hive opened, and shake the bees off it down in front of the entrance, holding close down so the bees are in or as near the entrance when leaving the comb as possible."

"Why this close holding and shaking?"

"So the bees will take wing as full as possible, and so that none need to fly so far from the hive but that they can readily run off with the majority. Having them off the first frame, next shake the bees off from a frame to the next hive, and so on, alternating in the shaking the same as in filling the hive, thus uniting the bees from the several hives all up."

"Why do you wish them mixed up?"

"The mixing of the bees takes the disposition to fight and kill one another out of them when filled with honey as above; for when each bee touches another it is a stranger, so that the individuality of each colony is lost, and the combined two, three or four colonies unite within two or three hours to make one individual colony again, which will prove itself true from all intruders, the same as the separate colonies did before."

"Is that all there is of it?"

"Not quite. As soon as the bees are all shaken off their combs, gently blow a little smoke on the outside bees to make them all enter the hive, should they be slow in doing so; and as soon as all are in the hive, place a board about half an inch wide at the top, against it, standing the bottom out a piece from the entrance so it stands slanting over it."

"What do you do that for?"

"This is done so that the next time the bees fly they will bump up against it, as it were, thus causing them to know that it is a new location they occupy, when they will mark the place the same as a new swarm does, after which the bees will adhere to it instead of going back to the old location they used to occupy before uniting. And to help in this matter further, it is always best to remove everything from the old stands; so that nothing home-like remains to entice them back."

"What about the queens? Do you put them all together?"

"If there is a quantity of queens in any of the colonies to be united, hunt out and kill or dispose of the poorer ones, so that the best may be preserved. This hunting-out of the queens is better done some day before the uniting, for in the smoking and pounding process the queens will not be where they are readily found when uniting. If there is no choice in queens, and the extra queens are of no value, the bees will attend to the matter, killing all but one of them."

CONVENTION NOTICES.

Chicago.—The executive committee of the Chicago Bee-Keepers' Association has ordered that the next meeting be held all day and evening, Dec. 5, 1901, at the Briggs House club-room. This is arranged on account of the low rates to be in force then for the International Live-Stock Exposition in Chicago at that time (Nov. 30 to Dec. 7, being one fare plus \$2.00 for the Chicago Association, and so very few declining 300 bee-keepers near Chicago, and should result in the largest attendance we have ever had. Dr. C. C. Miller and Mr. C. P. Dadant have promised to be present. Let all come.

HERMAN F. MOORE, Sec.

GEORGE W. YORK, Pres.

Colorado.—The Colorado annual meeting promised to be a genuine success. The program has been made out for a number of weeks, and is almost ready for publication. It has come to be a privilege and an honor to read a paper before the association, and so very few declining who are invited to write or speak for instruction. One paper is already in the hands of the secretary. On two or three nights a big magic lantern will talk by the lanterns students of bees and the bee industry. And then we are going to have an exhibition of the choicest honey in the United States (made in Colorado, you know), and wax, with bees enough to show "how the thing is done."

If you want to know more, or have forgotten the dates (Nov. 18, 19, 20), write to the undersigned, box 432, Denver, Colo.

D. W. WORKING, Sec.

Wanted

Fancy White Comb Honey in no-drip cases; also Extracted Honey. State price, delivered. We pay spot cash. FRED W. MITTH & CO., Front & Walnut Sts., Cincinnati, Ohio. Reference—German National Bank, Cincinnati.

40A51 Please mention the Bee Journal.

Wanted Comb and Extracted Honey!

State price, kind and quantity. R. A. BURNETT & CO., 190 S. Walnut St., Cincinnati 33A1T Please mention the Bee Journal.

Wanted—Honey.

Car Lots or otherwise; will pay highest market price, spot cash. Address, stating quantity, quality, and price desired at your station. Will send man to receive when lot is large enough to justify. THOS. C. STANLEY & SON, 31A1T W. FAIRFIELD, ILL.

Wanted

Comb Honey and Beeswax. State price delivered in Cincinnati. G. H. W. WEBER, 43A1T 2146-2148 Central Ave., CINCINNATI, O.

SWEET CLOVER

And Several Other Clover Seeds.

We have made arrangements so that we can furnish Seed of several of the Clovers by freight or express, at the following prices, cash with the order:

	5lb	10lb	25lb	50lb
Sweet Clover (white).....	\$1.00	\$1.00	\$2.25	\$4.00
Sweet Clover (yellow).....	.90	1.70	4.00	7.50
Alsike Clover.....	.90	1.70	3.75	7.00
Alfalfa Clover.....	1.00	1.90	4.50	8.50
Alfalfa Clover.....	.80	1.40	3.25	6.00

Prices subject to market changes.

Single pound 5 cents more than the 5-pound rate, and 10 cents extra for postage and sack.

Add 25 cents to your order, for cartage, if wanted by freight, or 10 cents per pound if wanted by mail.

GEORGE W. YORK & CO.

144 & 146 Erie Street, CHICAGO, ILL.

HONEY AND BEESWAX

MARKET QUOTATIONS.

CHICAGO, Nov. 1.—The market is easier in tone, while prices are nominally the same, but would be shaded to effect sales. Some cars of honey enroute to the Eastern cities have been diverted to this and surrounding points, which is having a depressing effect. Comb, bring 144c/15c for best grades of white; light amber, 120c/13c; dark grades, 100c/11c. Extracted, white, 55c/56c, according to quality, flavor and package; light amber, 52c/53c; cut amber and dark, 50c/51c. Beeswax, 28c. R. A. BURNETT & Co.

CINCINNATI, Oct. 25.—The honey market is rather dull on account of the warm weather. Extracted sells only to manufacturers from 50c/6c; better grades alfalfa water-white from 60c/7c; white clover from 80c/9c. Fancy white comb honey sells from 135c/40c.

C. H. W. WEBER.

ALBANY, N. Y., Oct. 25.—Honey in good demand now, as this is the most satisfactory time to sell. Grocery men are stocking up and will buy lines, when late they only buy enough to piece out. Fancy white comb, 150c/16c; mixed, 140c/15c; buckwheat, 120c/13c. Extracted, white, 65c/75c; mixed, 60c/65c.

H. R. WRIGHT.

OMAHA, Oct. 25.—New comb honey is arriving by express in small quantities from Iowa and Colorado, and selling at \$3.50 per case in a retail way. California extracted honey is being offered at 60c/65c; cover money, 1.00. California shipping-points, but we have not heard of any sales having been made thus far. The production of extracted honey seems to be quite large this year in Colorado, Utah and California.

PEYCKE BROS.

NEW YORK, Oct. 18.—Comb honey is in good demand and finds ready sale at the following quotations: Fancy white, 15c per pound; No. 1 white, 13c/14c; amber, 12c; buckwheat, 10c/11c. Extracted rather quiet at 60c/65c for white, and 55c/60c for amber. Beeswax rather quiet at 27c/28c.

HILDETH & SGOELKEN.

BOSTON, Oct. 21.—There is a fairly good demand for stocks with ample supplies at the present writing. Fancy No. 1, in cartons, 135c/140c; No. 2, 125c/130c; No. 1, 15c; very little No. 2 is being received; faint, front cases will bring about 5c per pound less. Light California extracted, 7c/8c; Florida honey, 6c/7c.

BLAKE, SCOTT & LEE.

DES MOINES, Oct. 25.—There is very little doing here in new crop of honey. Some small lots of nearly finished comb honey are on the market and selling in a retail way at \$3.50 to \$3.75 per case. We do not look for much trade in this line before Sept. 1. Our market does not consume a great deal of local grain and hay.

PEYCKE BROS. & CHASEY.

DETROIT, Oct. 25.—Fancy white comb honey, 140c/15c; No. 1, 130c/140c; no dark to quote. Extracted, white, 60c/7c. Beeswax, 25c/30c.

M. H. HUNT & SON.

SAN FRANCISCO, Oct. 16.—White comb, 10c/12c; amber, 7c/8c; dark, 6c/7c. Extracted, white, 55c/60c; light amber, 45c/50c; amber, 40c/45c.

Values are ruling steady, with no very heavy spot offerings and a fair inquiry, more especially for extracted. A sailing vessel, clearing the past week for England, took up part cargo 75 cases of extracted honey, and 45 cases extracted went by rail for New York.

Beeswax—Good to choice, light, 24c/28c. No great quantities arriving, and stocks are given little or no opportunity to accumulate to any noteworthy extent. Values are without quotable change.

KANSAS CITY, Oct. 25.—Up to the present time only small lots of new comb honey have been on the market, and these met with ready sale on the basis of 150c/160c for white and fancy white. For next week heavier receipts are expected and quotations are issued at \$3.00c/\$3.25 per case, so that the demand would be equal to about 140c/145c; the demand being quite brisk, a firm market is anticipated. Inquiries for extracted are a little more numerous, but large buyers of honey, here, fix their ideas too low. In a small way 55c/60c is quotable.

PEYCKE BROS.

A New Bee-Keeper's Song—

"Buckwheat Cakes and Honey"

Words by EUGENE SECOR.

Music by GEORGE W. YORK.

This song was written specially for the Buffalo convention, and was sung there. It is written for organ or piano, as have been all the songs written for bee-keepers. Every home should have a copy of it, as well as a copy of

"THE HUM OF THE BEES in the APPLE-TREE BLOOM"

Written by
EUGENE SECOR and DR. C. C. MILLER.

PRICES—Either song will be mailed for 10 cents (stamps or silver), or both for only 15 cents. Or, for \$1.00 *strictly in advance* payment of a year's subscription to the American Bee Journal, we will mail both of these songs free, if asked for.

Texas Bee-Keepers.

New Branch Office. We beg to announce the opening of a branch office and warehouse at 438 W. Houston St., San Antonio, Texas. Rates of transportation from Medina are less than car-load lots are high, and it takes a long time for a local shipment to reach Southern Texas points.

Low Freight and
Quick Delivery.

San Antonio as a
Shipping-point.

To secure these two necessary advantages—low freight and quick delivery—and to be better prepared to serve the interests of our Texas friends, is our reason for establishing this new branch office. No other point in Southern Texas is better adapted to serve as a distributing point than San Antonio. It has four great railroads—the Southern Pacific R. R. east and West—the International and Great Northern R. R. from Laredo up through San Antonio and Central Texas, the San Antonio and Arkansas Pass R. R., and San Antonio and Gulf R. R. It also has the American, Wells-Fargo and Pacific Express Companies.

Our Managers.

We have secured as managers Mr. Udo Toepperwein, formerly of Leon Springs, and Mr. A. Y. Walton, Jr., both of whom are well known to the bee-keepers of South and Central Texas. They are also thoroughly familiar with practical bee-keeping and all matters associated with it, and any orders sent to this branch will receive prompt, careful attention.

Our Goods.

As usual, our motto is to furnish the best goods of the most approved pattern. We do not undertake to compete in price with all manufacturers. Bee-keepers have learned that it does not pay to buy cheap supplies, for a saving of 10 cents on the first cost of a hive may be a loss of many times this amount by getting poorly made and ill-fitting material. Every year brings us many proofs that our policy of "the best goods" is a correct one.

Our Catalog.

Very few changes in prices will be made in our new catalog, so do not delay your order, but send it at once. You will be allowed a refund if lower prices are made, and in case of higher prices ruling in the new catalog, if any, you will secure the benefit by ordering now. Catalog and estimates may be had by applying to the address given below.

Our Invitation.

Whenever you visit San Antonio you are invited to call at our office and make it your headquarters. Here you will find a display of Apianian Supplies not equaled elsewhere in Texas. You will also find on file the leading bee-journals to pass pleasantly your leisure time.

Spanish Catalog.

Some of you may read Spanish, or have a bee-keeping friend who does. If so, call for our Spanish catalog. It's sent free.

☞ If more convenient, Dues may be sent to the office of the American Bee Journal, when they will be forwarded to Mr. Secor, who will mail individual receipts.

A Celluloid Queen-Button is a very pretty thing for a bee-keeper or honey-seller to wear on his coat-lapel. It often serves to introduce the subject of honey, and frequently leads to a sale.

NOTE.—One reader writes: "I have every reason to believe that it would be a very judicious thing for a bee-keeper to wear one [of the buttons] as it will call people to ask questions about the busy bee, and many a conversation thus started would wind up with the sale of more or less honey; at any rate it would give the bee-keeper a superior opportunity to enlighten many a person in regard to honey and bees."

The picture shown herewith is a reproduction of a motto queen-button that we are furnishing to bee-keepers. It has a pin on the underside to fasten it.

Price, by mail, 6 cents; two for 10 cents; or 6 for 25 cents. Send all orders to the office of the American Bee Journal.

Weekly Budget.

MR. A. N. DRYER, of Madison Co., Ill., called on us recently when in Chicago on business. He reported a very poor honey crop from his 250 colonies of bees.

MR. E. B. GLADISH, secretary of the Lehigh Mfg. Co., gave us a short call last week, when on a trip among the bee-supply manufacturers of Wisconsin. He reports doing the largest volume of business the past season in the history of their firm, even exporting a carload or so of supplies to Cuba.

THE CHICAGO CONVENTION, Dec. 5, gives good promise of being a genuine "hummer." Already we have had notice from several beekeepers from Iowa who are planning to be present. Of course, Wisconsin and Indiana will be well represented. We wouldn't be surprised if Ohio would be on hand, too.

Editor Hutchinson, over in Michigan, writes us as follows, Oct. 31:

FRIEND YORK—I am pleased to see the indications that your Chicago convention promises to develop into something like the old Northwestern meetings. I am going to give a good send-off in the next Review, and then take a run over myself and attend the meeting.

W. Z. HUTCHINSON.

There's nothing the matter with that. As Dr. C. C. Miller and C. P. Dabant have also promised to come, a splendid meeting is already assured.

But there must be a big turn-out of beekeepers living near Chicago. The coming convention can easily be made to equal the Buffalo convention, both in attendance and profitable discussion. All in the Northwest can not attend the annual meeting of the National Bee-Keepers' Association, but everybody wants to come to Chicago, and can generally do so if a real desire to come exists.

The Revere House, southeast corner of Clark and Michigan streets, will rent rooms at 75 cents or \$1.00 per night, depending upon the kind of room taken. This is the hotel where many beekeepers stopped when attending the Chicago meeting of the National Association in 1900. Of course, there are many other places besides the Revere House.

THE BRIDAL PARTY, shown on our first page this week, will be a complete surprise to the quartette represented, for their consent to it was not secured, but we think they will not protest very seriously, as such a fine wedding group is not seen every day.

We need hardly remind many of our readers that the girls are the twin daughters of our brother editor, W. Z. Hutchinson, of Geneseo Co., Mich. They had a double wedding, Oct. 16, so Mr. H. that day added "twin boys" to his family, which was quite in keeping with the coming of the twin girls 25 years ago.

The couple on the right in the picture is Mr. and Mrs. (Nora) A. G. Hartsborn, the one on the left Mr. and Mrs. (Cora) E. F. Hanneman. Quite a wedding was made for them, but instead of paying a florist a high price to decorate the house, most of it was done by the Hutchinson family, including "the boys." The parlor was trimmed with asparagus and palms. Then there was a double arch of smilax, with a floral bell of white carnations suspended from the top of each arch. The sitting-room was trimmed with pine boughs. Mr. Hutchinson himself went up the river two or three miles into the woods and gathered the branches of pine. Then he went to his old home, where there was a large mountain ash, climbed the tree

and brought home a basket of the bright red berries; these the girls mingled among the dark green of the pine twigs. They covered the walls of the dining-room with sheets of thick, heavy paper, tacking them on. Paste was then applied to the paper, and bright autumn leaves stuck on, overlapping them like the shingles on a roof. Pains were taken to get bright colors—yellow, raw brown, green, etc., mingling them together. It took the boys and girls, with Mr. H. himself, one entire day to decorate this room, but it was novel and beautiful, and "brought down the house."

We learn that a large number of beautiful and useful presents were received, and the girls and their husbands have gone to house-keeping in homes of their own, in a style quite a little beyond the humble beginning of Mr. Hutchinson and his wife. We understand that the young men are good, honest and upright, and free from any bad habits. Of course, such girls wouldn't choose any other kind. Mr. Hartsborn was always living in Geneseo county, and is a clerk in a leading dry goods house. Mr. Hanneman was born in Germany, came to this country when eight years old, served Uncle Sam two years in the Philippines, coming home last April, and is now a trimmer in a carriage factory.

One of our present visitors is that "Nora" is to live right next door to her father, while "Cora" is to be only one block away.

We wish to extend our heartiest congratulations to all concerned, and hope that any troubles that may come to the quartette may be "only little ones."

MR. A. E. WILLCUTT, of Hampshire Co., Mass., has his next little apirary shown on page 727. When sending the photograph, Mr. Willcutt wrote as follows:

I very much enjoy looking at the pictures of our bee-friends and their apiaries, which appear in the "Old Reliable" from time to time. Let us thank the several editors of the existing bee-papers for the many beautiful illustrations which appear in their publications.

Not wishing to appear selfish along this line, I send a photograph of my apiary, which will also give at least a "squisit" at "Yours Truly" among the "little pets." The lady in the picture is my "favorite queen," the boy is her brother, and is taking a lesson in handling a frame of bees. The hive we have open is not shown in the picture. I make all my bees, super, and most of the brood-frames. I use the Langstroth hive, 10-frame size, and work for both comb and extracted honey.

It has been a poor honey season in this "locality," bee-keepers on all sides reporting little or no surplus. I have one colony of black bees which gave me 66 one-pound sections of honey and 10 pounds of extracted, also one large swarm. I have three and five banded Italians in my yard, but the blacks took the lead this year as honey-gatherers.

I have only one thing new to offer, and that is the shade-board which I use, one of which can be seen leaning against a hive, and shows it to be No. 14. They are made of material that will not shrink, crack or decay in any climate, not excepting Colorado. They are made of half-inch material, 24x30 inches. If painted white they are very pretty, and keep the hives cool in hot weather. I use a 1/2-inch plain cover under them. It is easy to form an air-space by laying a strip under one or both ends of the shade-boards the desired thickness. We have had some very hot weather the past summer, but I have had no trouble from bees melting down, and kept very few bees clustered outside the hives. These shade-covers need no bricks, rocks, or any other unsightly thing to keep them from blowing off, for they are made of stone. We have a stone-quarry where I get them out, and the cost is but a few cents each.

A. E. WILLCUTT.

P. S.—I forgot to say that I took first money (or prize) on honey at our annual fair this year. I also had on exhibition an observatory hive of Golden Italian bees, the only exhibit of bees at the fair.—A. E. W.

AMERICAN BEE JOURNAL

ESTABLISHED IN 1861

THE OLDEST BEE-PAPER IN AMERICA

41st YEAR.

CHICAGO, ILL., NOVEMBER 14, 1901.

No. 46.

* Editorial. *

The Cold Snap.—Did it catch you? No doubt it did a good many. The latter part of October was so summer-like that it was easy to think that freezing weather might be far away, and so some last preparations for cold weather were put off from day to day with the thought that there was no immediate need for haste until the weather became at least a little colder. But that "little colder" weather never came. From summer weather there was a sudden jump right into winter weather. Here in northern Illinois we had in the last end of October a temperature of 80 degrees. All at once a cold west wind set in the night of Nov. 3, and by morning the thermometer registered 12 degrees.

Now, don't you wish that colony short of stores had been attended to in September? Well, look out another year.

Long Smelters.—A clipping from the Belfast Blaze, which has been received, contains among other things the following:

Mr. Ballard says that a honey-bee can smell clover honey two miles away. He cites an instance that once the nearest clover to his bees was over a mountain in the Hell Hollow district two miles away, and his bees all went there to gather honey. He says if you go out in the woods half a mile from a hive and burn some honey-comb that within ten minutes the bees will be attracted there from the hive by the sense of smell, if the wind is right. But some of the ways of the honey-bee are past finding out.

This is a case of correct premises, with a false conclusion drawn therefrom. It is true that bees will find a clover-field two miles from their home, and that in a few minutes they will find burning honey-comb within a half mile; but it by no means follows that they can smell anything two miles, or even half a mile, away. It would be just as reasonable to say that when a man went hunting and shot a squirrel two miles from home he saw the squirrel when two miles away. Bees are good hunters rather than long smelters.

Profits of Bee-Keeping are sometimes painted in rather bright colors, even when there is no real intention to mislead. Referring to some remarks on page 559 of this journal, in which some very bright painting in the August number of the American Bee-Keeper was commented upon, the editor of that journal says:

There can be no doubt that the glowing pictures sometimes painted of bee-culture and

its profits are open to criticism. The beginner, especially a youthful beginner, may in this way be led to expect too much; yet, with reference to the question in hand, we think no bee-keeper of experience would be inclined to regard \$5.00 per colony as big returns. It should always be borne in mind that any business enterprise is subject to adverse conditions and casualties. Then, there is a limit of one's personal capabilities to be taken into consideration. One apiarist can not properly attend to several apiaries; expense increases in proportion with the stock; forage must also be afforded in equal ratio. One colony might easily produce 100 pounds of comb honey. This might readily find a market at \$16.00; though one does not often hear of an apiary of 100 colonies yielding 10,000 pounds of honey, and that selling for \$1.60. We do not think it has occurred in recent years, that any apiaries of 1000 colonies have yielded \$16,000 worth of honey in one season, for reasons intimated above.

This is very appropriately said, and might well have been said in the August number, all except the part in which Editor Hill seems to support the statement: "It is a conservative estimate of the bee-keepers generally, however, that each colony should bring in at least five dollars a year." Does our esteemed fellow editor really believe that? If it be true, then it could be hardly out of the way to say to the would-be beginner: "If you have 50 colonies, you may be sure of \$250 at best in the very poorest year, and much more in a good year." Would he say that?

Temperature for Feeding Back. says Adrian Getaz, in the Bee-Keepers' Review, must be that of hot weather, or there will be loss of honey from consumption to keep up the proper heat. No one has ever made a success of feeding back except in hot weather and hot nights.

Confinement of Laying Queens.—In Gleanings in Bee-Culture, a foot-note to an article by Arthur C. Miller, reads as follows:

You may be right; but is it not putting it a little strong when you say, "We do know that the sudden confinement of a queen when in the full exercise of her natural functions almost always works serious injury." . . . We also know that a queen laying slowly, as in a small nucleus, can be caged with but little or no apparent injury." You italicize the word *known* as if the facts were established. Now, is that true? There has been a sort of surmise entertained by many good bee-keepers that both of these propositions might be true; but has either one of them been clearly and decidedly demonstrated? Understood, I do not deny either proposition; but I raise the question whether we have so far reported facts sufficient to prove, beyond a peradventure, both statements. In partial support of one statement, I will say that we have sent out sometimes, from our apiary, queens that were in full laying, and yet which on arrival at destination proved to be very unsatisfactory, laid a few eggs, and disappeared. At

other times we have taken queens from their lives in the height of the season, put them up in mailing-cages, and, later on, had most flattering reports from them. We send out a good many thousand queens in a season; and, unless I am very much mistaken, the majority of such queens (even when doing full duty) have departed themselves very creditably on arrival at their new home. If there is any queen-breeder, aside from Mr. Alley, who first cages in a small nucleus before sending out queens, I should like to have him hold up his hand. Now, understand, friend Miller, this is not offered as a challenge, but because I do honestly seek the truth. If it is demonstrated clearly that a queen removed from the hive when laying to her fullest capacity, and caged long enough to make a journey through the mails, is injured, then the sooner we prove the fact the better it will be for the breeder as well as for his customer.

It seems pretty certain that when queens are sent through the mails they are sometimes much the worse after the journey, and sometimes as good as ever. This has been explained heretofore, and perhaps satisfactorily, without laying any blame upon sudden confinement. There is a very great difference between the weight of a queen when laying two or three thousand eggs in a day and when not laying at all. A light-weight queen, when sent through the mail, has little difficulty in maintaining her footing in the cage, no matter what jars or jolts. On the other hand, when very heavy with eggs, a light jar makes her lose her hold, and a heavy jar may make her strike against the wood of the cage in such a way as to be seriously injured. It is a matter of accident, the light weight being little subject to accident, and the greater weight the greater the danger of accident. Yet a queen very heavy with eggs may go through in safety, the next one may be injured so as to be almost, if not entirely, worthless.

Ventilating Bees When Hauled.—R. F. Holtermann, in Gleanings in Bee-Culture, recommends as the best thing a sort of portion or cage of wire-cloth at the entrance of the hive. This was in use many years ago, and serves a good purpose. For those, however, who have deep bottom-boards, there is a cheaper, easier, and perhaps better way. If the bottom-board is two inches deep, there will be an entrance of the same depth, and this can be closed very simply with a single piece of wire-cloth. Then there will be under the hive a well-ventilated space in which the bees can congregate when it is too warm for them to stay on the combs, that space being, if an 8-frame hive is used, about 180 cubic inches in volume.

The Illinois State Convention is to meet in Springfield, Nov. 19 and 20. See fuller notice elsewhere in this issue.

The Buffalo Convention.

Report of the Proceedings of the Thirty-Second Annual Convention of the National Bee-Keepers' Association, held at Buffalo, New York, Sept. 10, 11 and 12, 1901.

(Continued from page 71.)

QUEEN-REARING—IN-BREEDING.

"In rearing queens is in-breeding objectionable?"

Mrs. H. G. Acklin, of Minnesota—There are so many present who are much more extensive queen-breeders than myself, that I would rather hear an expression from them. I think it is objectionable. We get queens from several different breeders and bring into our apiary every year.

Dr. Mason—Then your practice is not to in-breed?

Mrs. Acklin—Yes.

Dr. Mason—What makes you think it is objectionable?

Mrs. Acklin—I really don't know. In getting new queens you change your stock, of course, and get good qualities; in getting queens from different breeders and bringing in the best drones from your best colonies, you get your best stock. Of course, if you have any bad qualities in your queens at home you change them to a certain extent. We watch our queens very closely.

Dr. Mason—Why not dispose of the queens that you have that have bad qualities, and keep those that have the good, and breed from those right along?

Mrs. Acklin—I don't know as I am able to answer that.

Mr. Benton—It doesn't seem to me that there is the least objection to continued close in-and-in breeding, of itself. That means, of itself. Note well. In other words, if you have the intelligence to select the queens, and select the queens to breed drones with reference to the qualities which they possess and which you wish to perpetuate and fix in the progeny, and to avoid weaknesses, select such queens as mothers of the drones as will avoid weaknesses that are inherent in that strain that you are breeding from. From in-and-in breeding we can fix a type, or character, which we could not by constantly bringing in different strains or crosses. In all our hybrid animals the types have been established. We have a beef animal; we have a milk animal; we have a sheep that gives us long wool, and fowls that produce eggs, others produce meat, and so on, and in every instance all of those particular-purpose animals have been produced by careful, intelligent in-and-in breeding. From the very earliest start, therefore, I claim that in-and-in breeding is not harmful, but it is the lack of ability or experience to apply it that results badly. When we have a strain with a weakness and we do not bring in any other stock at all, we do not breed intelligently enough to fix

the stronger points in the breed, and eventually that strain will run out.

Mr. West—in regard to this in-and-in breeding, the question I was going to ask is, How much does that mean? Can we confine in-and-in breeding to bees with a queen of the same individual hive and let that constitute an apiary, and use the drones from that individual hive from year to year and remove all other colonies from the place? Would it be beneficial to in-and-in breed in that way?

Mr. Benton—I don't suppose such a case occurs at all, and in actual practice there is very little in-and-in breeding. It would require great care and attention, and the controlling of the drone-production and isolation of the apiary so that in actual practice there is more cross-breeding than in-and-in breeding. I really think it has been held up as a bugbear, and people that supposed they were breeding in-and-in were really not doing so, because there was such constant out-crossing, and I don't think that we would be able, with the greatest care, to confine to as close in-breeding as Mr. West refers to. When we speak of it generally, I think it refers to close breeding more than in-and-in breeding, confining drone-production and using perhaps the same queen mother constantly.

Dr. Mason—Perhaps 30 years ago I had a brother who kept bees, and I started in from two colonies that he gave me. He lived at least fifteen miles from anybody that kept bees. He got a good queen and he never bought any more, but he was constantly getting rid of the queens that showed poor qualities, and he had the best honey-gatherers I ever knew. He kept the bees pure. They were gentle and as nice as one wishes to see. That is what makes me believe in in-and-in breeding. They were Italian bees. I have a neighbor who raises poultry. He commenced nine years ago with a trio of Buff Cochins. He never has gotten another fowl of any description to put with his own. He has bred from his own and is a prominent exhibitor at poultry shows, and frequently acts as judge at large poultry exhibitions, and he always gets first premium on his Cochins that are in-and-in bred. These two things make me in favor of in-and-in breeding. I got a queen from a Michigan man last year, and I have tried to breed from that queen both queens and drones, and I think I have succeeded pretty well, and if I have done what I think I have done I don't want anything better. I am in favor of in-and-in breeding, but intelligently, as Mr. Benton talks about. It cannot be done at haphazard, taking anything and everything that comes along in your own apiary.

Mr. Abbott—I feel as if I wanted to vote on this. I am surprised to know that a man who has given as much attention to science as Mr. Benton has, is so in accord with the view that I have held for years, and which has been combatted by poultry people, and by everybody, in fact, wherever I have expressed it. This idea, which originated with Darwin, and has been repeated without limit since that time, has gotten such a hold in the world that it is pretty hard to get it out of the minds of the people. In fact, some people think they ought to be against in-and-in breeding because it is forbidden in the Bible. They sometimes give that as a reason. But, so far as animals are concerned, the best illustration of the result of in-and-in breeding is found in the State of New York. There is a man who originated what is known as the American Holderness cattle, and those cattle originated from a single cow that came from the Holderness cattle of England, some 40 years ago, and dropped a male calf, and all the cattle of that herd have that blood in them, said to be the finest herd of cattle on this continent. That man has used intelligent in-and-in breeding. He has taken out all of the bad qualities, eliminated them as fast as he came in contact with them, and bred in the good qualities, and that is what I believe in. The poultry people, of course, who have males to sell, would like to have you believe that it is a good thing to send across the continent and buy a male at a high price in order to keep your poultry healthy. I have been doing myself just what Dr. Mason says his neighbor has been doing, breeding Golden Wyandottes, and I haven't had any new blood for years, and I am quite sure that if I live for 50 years more (and I hope I will 100), I am quite sure that there will be no new blood go into that stock, but I kill every roopy hen, I exterminate every diseased rooster, and wipe out with the hatchet all tendency to disease; I don't tamper with it; I don't fool with it; I simply bury it beneath the ground out of sight. I believe that if bee-keepers can control bee-fertilization some time in the future, that they can get the best results from in-and-in breeding. I hope that we will get rid of this whole idea of Darwin, that cross-fertilization is necessary to perpetuate the race. There is nothing in it.

Mr. Benton—That person who obtained that trio of Buff Cochins must have gotten good stock, and then probably has selected intelligently. Now, suppose he had found, after breeding, that there had been some trouble with the stock, like leg weakness for instance, it is very doubtful if he could have gotten rid of it by simply killing off the old stock. It is probable that he would have had to cross with another lot of Cochins, fowls with good, strong legs we will say, for instance; in other words, put good legs on what is already good stock. I think in applying that to the bees, we would want, in some instances, to get a queen into our apiary of another race. To show how near qualities can be fixed by in-and-in breeding, I will allude to an experience of mine: I had some Rose Comb Black Minorca fowls, and I had a male of that breed and a female of the Rose Comb White Minorca. It occurred to me that no one had pro-

duced Rose Comb White Minorcas, so I started with that jet-black male Minorca, and the single-comb White Minorca hens. Now, after two or three generations, I get fowls that are pretty nearly white all over, by selection. I selected the lightest always, and by elimination in that way, in a few generations I secured a fowl that was entirely white, and reproduced itself and had a low rose comb, the true Minorca type, without any crossing with Leghorns or any other type at all, and produced with a male that was jet black, and whose progeny were always jet black. Occasionally, one of them would throw back, but that was only the exception, and that was done by in-and-in breeding. After this first cross between the jet-black male and the white female I didn't get any other blood into them.

J. H. M. Cook, of New York—What relation is the drone of a hive to the virgin queen produced in that hive? What true relation do they hold to each other?

Mr. Benton—You might say half-brother, perhaps.

Dr. Miller—I do believe that there has been a great deal of misapprehension on this subject, and yet amongst intelligent breeders I don't think that Mr. Abbott has been so much alone as perhaps he has felt. He has had good company. I believe that all intelligent breeders will tell you that if you put down the dictum that in-breeding must not be allowed, that it puts an end to nearly all improvement in breeding. It should be understood that in-breeding is the thing through which you will perpetuate the good qualities, and it is also the thing through which you will perpetuate the bad qualities. It is a good thing that a part, at least, of that old view should remain and to understand that fresh blood introduced will be a good thing, and that the cross-breeding after all is for the average layman the safe thing rather than to continue to breed exactly the same stock straight along. I believe the old view, just as bad as it may be, is the safer view. If you get into a man's head the idea that he doesn't need to pay the least attention to in-breeding, and that no harm can come from that, you are going to damage that man beyond computation.

Mrs. Acklin—We get our queens from different queen-breeders occasionally to try them, and we test them two years anyway before we take them in, but we always get the same strain of bee; we don't make a cross at all, and I suppose that there always is more or less in-breeding, because a great many times we breed from the same bees.

Mr. McEvoy—I would like to have Mr. Benton's opinion on the subject of crossing good Italians with Carniolans. Would it be profitable?

Adjourned to 1:30 p. m.

WEDNESDAY AFTERNOON SESSION.

The convention was called to order at 1:30 o'clock by Pres. Root, but, owing to a meeting of the Board of Directors at the same hour, he called Mr. York to the chair. The question asked by Mr. McEvoy previous to adjournment was then taken up.

Mr. Benton—I have never crossed Carniolans with Italians, so that my opinion in that matter would have to

be theoretical, and from what others have told me. As I was rearing Carniolans exclusively in one of my apiaries and have had Italians in another, and not desiring to cross the two races, I haven't attempted any experiments in that line. I have heard, however, very favorable reports of such crosses, and I see no reason why they should not be successful. The general type of the two races is alike as regards the form of the bee and their general economy in every way. They are not so radically different as the bees of Europe and the bees of the Orient. The Eastern races of bees are an entirely different type, and to cross an Eastern bee with the races native to Europe, would be like crossing, we will say, a race-horse and a cart-horse: some such comparison might be made, but when you come to crossing Italians and the Carniolan bees there is not that radical departure from the general type, and I see no reason why the two races would not amalgamate well, and having made the first direct cross I would then keep myself close to the Carniolan type, and wouldn't make any other direct cross, but breed from the best constantly. In case I brought in any fresh blood after that first cross I should myself desire to keep close to the Carniolan, simply because of the qualities that they possess, but I believe that the Italian would introduce a disposition in the bees perhaps to breed a little bit less during the honey-dearth than the Carniolans, and in some localities that might be beneficial, provided, of course, you could get those bees to breed during a dearth for a future harvest without having to feed them too long. The Italians, when the honey harvest lets up, are disposed to breed less than the Carniolans. The Carniolans are continually breeding during this time. That is a good quality, provided those bees that are produced then can be brought into a succeeding harvest. If there is no succeeding harvest to put them into immediately, it would hardly pay to feed them up to the time of the next harvest. In such conditions I think such crossing would be beneficial.

Dr. Mason—I had two of Mr. Benton's queens that I crossed with Italians, and I think they made the cross-best bees in the country, outside of Mr. Coggs's apiaries.

Mr. Benton: It seems to me that would be rather an exceptional condition, and, as I suggested, by keeping close to the first cross the gentleness would preserve in the main.

HIVE-COVERS FOR SUMMER AND WINTER.

"Have we a satisfactory hive-cover? Is there one made with a dead-air space so as to be warm for winter and cool for summer, and that will not warp or twist?"

Mr. Heise—When that question was raised I was wondering why any one wanted a warm hive-cover in winter; all that I want a hive-cover for is to keep dry the packing that I expect to keep the bees warm with. All that I use is a half-inch board for the roof, painted white on the top, which makes it cooler in the summer. I provide my bees with sufficient packing under the cover, and I don't care much what the cover is like so long as it keeps the packing dry.

G. F. Davidson—We use in Texas a flat cover without an air-space, but I never found one yet that wouldn't warp. We need an air-space in the summer to keep the combs from melting down, but we never have found one yet that would not warp in Texas. We have used the flat board, and the covers that were made of three different boards, "auxiliary covers" they are called, and they all warp in Texas. We have there about six or seven months of sunshine, without any rain on them.

Mr. Betsinger—I have a cover that doesn't warp or twist. It is a simple frame box with a tin cover telescoped on top of the hive, and is cleated so that the cover doesn't come down to the board within half an inch. Now, the telescope cover is half an inch larger every way than the hive. That cover won't warp or twist I don't care where you put it. And it is cool in the summer; I never had combs melt under it. For experiment I had made another case just like the cover with the cover fitted that left a dead-air space all around the inner hive, then combs melted. A telescope cover lets the air all around the interior of the hive, and although the sun shines directly on it, the combs will never melt under it. The covers will cost about 50 cents apiece if you make them right. A 14x20 sheet of tin makes the cover.

As Mr. York was called out to confer with the Board of Directors at this time, Mr. Heise was requested to take the chair.

Mr. Wilcox—I have a gable-roof cover that sheds the water and is a very good one. I have also such a cover as Mr. Betsinger has described, which also sheds water. Either will do well, but to guard against the melting of comb in very hot weather you need the double thickness with the air-space between, in some localities, but I would rather have a cover, if possible, that would make a hive warmer than to make it cooler. In Wisconsin we are troubled more with cold weather than warm weather, but the difficulty has been with flat covers—the water would seem to work in it, ooze in around the hive, unless you have a gable cover, and I want something better if there is any.

Mr. Heise—I would like to have the next person who takes up the subject of hive-covers to tell us what is a dead-air space.

Mr. Wilcox—If you have a gable cover it is easy enough to lay a flat cover inside of that, and there will be a dead-air space. A dead-air space is simply the thickness between two pieces of boards where the air cannot circulate.

Mr. Betsinger—That point is very important. We don't want dead air; we want live air.

Mr. Wilcox I want to criticize that. He says we don't want it. It depends upon what result he desires to attain. The dead-air space to keep the cold out; the opposite to let the cold in, in hot weather.

Mr. Betsinger A dead-air space is colder than no space at all. When the sun shines more heat will penetrate through one wall than two walls. The interior of the hive is dryer where the sun can shine on one single wall.

Mr. Wilcox Suppose it is so cloudy for three months that the sun doesn't

shine, and all the heat comes from the bees.

HIVING A SWARM WITH A NUCLEUS.

"When a swarm issues with a clipped queen, if the hive with the clipped queen be removed and replaced by a hive containing a nucleus, will the returning swarm kill the queen in the nucleus?"

W. L. Coggsall—If you get foreign bees with a strange queen, they will kill it invariably.

Dr. Mason—That is, if it is a swarm that has gone out, and they come back to a nucleus that has a queen, will they kill that queen?

W. L. Coggsall—Strange bees are quite apt to kill another queen.

Mr. Betsinger—My opinion is that they wouldn't kill the queen, for the very reason that the nucleus wouldn't let them.

Mr. Wilcox—My experience is that they will not, nine times out of ten.

Mr. West—If I had swarming that way, with a nucleus, after removing the old colony, when the swarm returns I would shake the nucleus bees off on the ground and let them return with the swarm. When the swarm is returning the old queen has been caged, and removed. Shake the nucleus—bees, queen and all—and let them all run in together, and all is well.

Mr. McEvoy—I don't think you can do any better if you talk a whole afternoon to discuss the question.

Mr. Tyrrell—I would like to ask if a little smoke applied to that nucleus wouldn't produce the same effect as shaking the bees?

Mr. Wilcox—Before the others returned I have often poured them down from the hiving-box, smoked the nucleus and united them with weak swarms.

Mr. Heise—When that swarm returns, having lost their queen, there is very little fight in them. They will accept almost anything—glad to get a home.

Dr. Mason—If Mr. Betsinger is correct in that matter, and the nucleus will protect the queen, and you smoke that nucleus, that takes the protect out of them, doesn't it?

KNOWING WHETHER A VIRGIN QUEEN IS PRESENT.

"How can I tell whether there is a virgin queen in a hive if I cannot find her?"

F. J. Miller—There is no way that I know except to wait a few days and look for larvae or eggs.

W. L. Coggsall—You will see the bottom of the cells polished out where the brood nests.

Mr. Cook—Place a frame of brood in it and wait three days.

Mr. Davidson—They make a queenless noise.

Mr. Benton—Watch the entrance just at sundown after they have lost their virgin queen and they will be running excitedly about seeking for the queen. I want to ask Mr. Coggsall if the bees begin to polish out these worker-cells before the time approaches for the queen to begin laying eggs. They will begin to remove the honey and polish out the cells, but they will not do it until near the time she is about to lay. The point would be, I suppose, not to lose any time waiting for that time.

W. L. Coggsall—That would give you warning that she is there.

SELECTING LARVÆ FOR QUEEN-REARING

"When a colony is made queenless will the bees, in their haste to rear a successor, select larvae too old to secure the best results?"

Mr. Davidson—I think it is very seldom that the bees select that kind of larvae. I have noticed it only a few times in my experience with bees, that they have selected larvae too old. I have seen them and it didn't look as well as it might if reared from younger larvae. I think that it is very seldom that the bees make that mistake.

Mr. Benton—I agree with Mr. Davidson. The conditions under which they do select rather too old larvae seem to be when the colony is weakened by any means; for instance, it is a small colony, or what might be called only a nucleus, but a colony in good condition and gathering honey rapidly, will rarely make a mistake and get the larvae too old.

Mr. West—In regard to removing a queen from a colony of bees, I have an apiary of about 80 colonies that about June 1 and about the time the swarming begins, I remove the queens from these colonies of bees and on about the 10th day I again remove all the queen-cells that are started in that apiary. I save the choicest cells for rearing queens, and from those cells I rear young queens which are replaced again in those colonies about four days later. We do that to control swarming. We have other objects in view, and through several years of selecting our best cells in that way, we rear about as many queens again as we need, and we make a selection again by using the best queens according to our judgment. I have never had better results in any apiary than I have had by getting my queens in this way.

HOW LONG TO REAR A QUEEN?

"How long from the laying of the egg to the emerging of the queen?"

Mr. West—16 days, generally.

Mr. Betsinger—It varies from 15 to 17. The largest colonies getting the most honey will produce queens that will mature quicker than smaller colonies with less honey.

Mr. West—If colonies are in a normal condition and everything favorable it will not vary from 16 days.

Mr. Benton—It is a question of continuity of heat in the hive, and I agree with Mr. Betsinger in the main. The time varies one way or the other for a number of hours. It may be less than 16 days or a little more than 16 days, but in a well-developed colony where the heat is continuous, I think the average time is about 16 days. We find the worker-bees sometimes come out in 19 days and very commonly in continuous heat in the latitude of Washington they emerge on the 20th day from the time the egg is laid, showing it is due to steady heat which develops it more rapidly.

YIELD OF HONEY PER COLONY.

"Which will give the greatest yield, a colony and its swarm, or the same colony if it does not swarm?"

Mr. Hershiser—It depends entirely upon how early in the season you get the swarm.

Mr. Greiner—It depends also upon how it develops. If you have a late flow I should say the swarm and the mother colony will produce the most honey, every time.

Mr. Betsinger—It depends largely upon who has hold of the helm.

Mr. McEvoy—It depends a good deal on how you manage the business.

Mr. Betsinger—I will say to those bee-keepers who can get the most honey out of a colony of bees that does not swarm, they have something to learn.

A Member—In my locality they would say no swarming. Keep them together.

Mr. Niver—I have always contended that I like Carniolan bees because they would swarm. The more they swarm the better. An Italian colony will stop breeding at the time of a honey-flow, and at the end of a late honey-flow, which comes about July 20 with us, if they stop breeding for a month, and we haven't got a good, big colony to commence the buckwheat with, we don't get much honey.

W. L. Coggsall—We get more from the increase and the colonies divided.

Mr. Greiner—Would that apply to your colony through two or three swarms?

Mr. Niver—Perhaps that is stating it a little strong. When you get second and third swarms you are weakening your colonies all around. I always like the Carniolan bees because they swarm.

Mr. McEvoy—Couldn't we divide this question up a little? When the honey-flow ends early and they have no buckwheat, how can I manage the business to get the most honey from one colony?

Mr. Betsinger—We have on record colonies producing from 600 to 800 pounds—single colonies. Now, then, was there ever more honey produced from a first mother colony and its increase—extracted honey?

Mr. McEvoy—Was there buckwheat in that locality?

Mr. Betsinger—A moderate supply of everything right through.

Mr. Benton—I think, perhaps, it might be interesting in this connection to speak of the practice in Carniola itself. It is a great buckwheat country. There are miles upon miles of buckwheat there. The whole practice of the bee-keepers there is to stimulate their colonies to the utmost in the spring and right through the swarming season by feeding them—feeding them at times when I wouldn't think of feeding at all; when the bees are still gathering they rush them forward by great stimulation. The point is to get them to cast two or three swarms from each colony, to get them into condition for the buckwheat harvest, and they get excellent results, and better, I think, than they would by preventing the swarming in that region. The largest yield on record was where there was considerable swarming—seven or eight colonies taken from one—and all got in condition for a fall harvest, not a buckwheat harvest; that is, of Mr. B. F. Carroll, of Texas, which was 1,000 pounds.

Mr. West—The question depends upon so many circumstances. If we have but a very few bees in the apiary and they are strong and well-to-do in the early spring, let them swarm and

you can get more from the swarm and the parent colony; but where we have an apiary of 80 to 100 colonies, and all the bees we need to gather the surplus honey of the field. I prefer not to have any increase to amount to anything, because the old colony will gather the honey, and it makes us less work in handling hives and extra fixtures, and it saves us considerable work.

W. L. Coggsball—From what Mr. Betsinger said about feeding, you might infer that I feed sugar to stimulate. I never fed a pound of sugar in my life to stimulate.

WAX-SECRETION.

"Is wax secretion voluntary or involuntary?"

Mr. Benton—Largely voluntary.

Mr. Betsinger—I'd like to know why.

Mr. Benton—Simply this: If we give a colony its combs there is not a great secretion of wax, even though they are gathering honey rapidly. If, on the other hand, we give a colony starters or hive it in an empty hive, it has its combs to build, and it will use quantities of honey that otherwise would be stored, in the secretion of wax to build those combs. Therefore, I regard it

as voluntary, since in the one instance they have used no wax to amount to anything, and in the other they have used a good deal when there was the need of it.

Mr. Betsinger—You plant a little grain in the ground and it comes up and grows. Is that voluntary or involuntary? You can hold it back or you can force it. So it is with bees. They secrete wax and they cannot help it so long as they gather honey, but you can increase that by feeding. But they are compelled to secrete wax so long as they live and gather honey.

Unfinished Sections in the Fall—How to Obviate Them.

BY G. M. DOOLITTLE.

A correspondent writes thus: "Nearly every fall I have half or more of my sections in the unfinished or uncapped state; and especially has this been the case the present fall, when very nearly two-thirds of them were unsalable on account of their not being capped over. Could you not tell us something about how this can be prevented, through the columns of the American Bee Journal?"

WELL, I will try my hand at the matter, but I cannot do quite as well at answering as I might did I know your location and your management. How to manage our bees so as to secure the greatest yield of comb honey is a question of great importance to all those who are engaged in producing such honey for market, and for this reason we find many more articles on this subject than we find on other things, which, perhaps, might help us more, for comb honey is of little value unless properly finished or capped over. Therefore, the thing the questioner asks about, "how to manage our bees so as to have few uncapped sections in the fall" is to very many a question of as much or more importance than the one regarding comb-honey production, which has been written on for nearly half a century.

For years I was troubled by having from one-fourth to one-half of the combs in the sections not fully sealed, at the close of the honey harvest, which were salable only at a reduced price, if at all; but of late years I have but few of such, even in a poor season. After experimenting several years in the matter I became convinced that the cause of the trouble was in giving the bees too many sections; and especially conducive to this was the plan of tiering up sections late in the season. How often have I, years ago, spoiled a promise of an abundant yield of comb honey by tiering up four or five days before the honey-harvest closed. To tier up sections profitably requires considerable tact, and especially do we want a thorough knowledge of the honey-resources of the field we occupy.

Another thing, I have often thought there has been too much injudicious talk in our bee-papers during the past in regard to allowing the bees, under any circumstances, not to cluster on the outside of the hive, the idea being generally conveyed that when bees thus cluster out, they need more room. Now, that depends upon when this clustering-out occurs, whether more room is needed or not, and hence I said "injudicious talk." If the clustering-out occurs at the commencement, or in the very heart of the honey-harvest, then more room should be given, while, if at the latter part of the harvest, or in a time of honey dearth, no more room is needed, for more room at such times results in the one case in many unfinished sections, and in the other an absolute waste of time used in enlarging the hive. To illustrate:

During some seasons we have but a few days of nectar secretion, and that often after the flowers which produce the honey-yield in our locality are past their prime. At such times we often do not have half the surplus room on the hives which we would use in good seasons, and for this reason the bees begin to be crowded out before they have commenced in the sections at all. Hoping that the weather may be good during the rest of the time that the flowers are in bloom, we give double the room that they had before, only to have it soon turn down the weather again, thus giving us only part-filled sec-

"RED STAR APIARY," OF A. E. WILLIOTT.—See page 722.

tions in the fall, while, had we left them as they were, all would have been finished, and we and the bees have been happy.

My plan of operation to secure all capped sections or as nearly so as may be, when the season closes, is as follows: When the bees show by building bits of comb here and there about the hive, and by lengthening the cells along the top-bars of the frames, that they are securing honey from the fields, I put on sections to the amount of the smallest capacity of one of my surplus arrangements—or say 20 to 25 pounds—and leave them thus until the bees are fairly well at work in them, when I add more room to the amount of one-half that put on at first, if possible; and, if not, then the smallest possible amount consistent with the surplus arrangement I use, generally putting this last under the one the bees are already nicely at work in, if this room is needed during the first half of the probable surplus yield. When more room seems likely to be needed, by finding that the room now on is fully occupied, it is given by placing wide frames of sections containing full sheets of extra-thin comb foundation at the sides of those sections the bees are already at work in; or, if our surplus arrangement will not admit of doing this, by placing these same sections over those already occupied.

By working according to this last-named plan, the bees always have plenty of room so that they are never crowded, yet it is given in such a way that they will always complete all of the sections underneath or between, which were fully occupied when this latter room is given.

By the time more room is needed, the sections first given are ready to come off, when, as they are taken off, more room is given at the sides or top, as the case may be, and thus the bees are kept finishing sections the nearest over the brood-chamber and commencing in those furthest away. In this way the season will close with a minimum number of unfinished sections, instead of a maximum number, as is generally the case where the old way of tiering up is used.

I am well aware that we used to argue that by putting the empty sections between those already occupied and the brood-nest, the bees were incited to greater activity, and, as a result of this activity, a greater result in comb honey would be secured, but after trying both plans side by side for several years, I can see no difference in the yield of honey in thoroughly good years, while in from fair to poor years the plan above outlined gives much the greater yield of marketable honey.

Orondago Co., N. Y.

NO. 2.—APICULTURE AS A BUSINESS.

Some Colorado Conditions—Average Yield—Prices and Outcome.

BY R. C. AIKIN.

I WANT the ear of all apiarists who are in apiculture to make it a business. I know there are a great many who have a few colonies to obtain honey for their own tables, others for recreation, and yet others who keep bees as a side-issue to some other business. Those who are playing with the bees need not read this discussion, but those whose motive is for either home consumption or for market, surely should consider the cost. I shall write mainly for Western conditions, and, for several reasons, principal among which are, 1st, I am more familiar with conditions here; 2d, more people in the West make a special business of honey-production; and, 3d, the Western apiarist has more difficult problems to solve.

As indicated in No. 1, not even in Colorado, where alfalfa, sweet clover, and clover abound, do we have a *sure crop*. Every Eastern apiarist thinking of coming here to get the advantage of a field where he can have a honey crop every year, would better stop and learn if his ideas are right. My field, and the county in general, as well as other counties and localities in the State, have both alfalfa and sweet clover in sufficient quantities, so that either will give some surplus honey should it yield freely.

The trouble with alfalfa is this: Being in growth similar to sweet clover, a strong, rank plant, though not so large as the latter, if allowed to mature to the extent of getting into full bloom or any ripe seed upon it, the stems become hard and woody, so much so that stock will not eat these coarse stems unless forced to do so by very scant feeding; hence, the rule is to cut for hay just as the bloom begins to appear. In this latitude and altitude, spring is a little later than southern Iowa, central Illinois, Ohio and Indiana, probably about two weeks. The southern parts of this State will be from 2 to 3 weeks earlier than here, and lower altitudes in the same latitude will be earlier.

Alfalfa delights and grows rapidly in a moist but not wet soil. A big rain or an irrigation that fills the soil with moisture puts it in prime condition for rapid growth in hot, sunny days. Our altitude—5,000 feet here—causes cool nights, many nights in April coming close to frost, even in May being quite cool. The fact is, that, as a rule, all the year through we have cool nights, and, often, some frost appears in places almost every month. However, while the nights are cool the days are warm, the rapid and extreme changes in temperature between midday and midnight being much greater than in lower altitudes. In May and June the days become quite hot, and then the alfalfa "gets a move on it" and grows rapidly. In my locality it comes into bloom sufficiently to begin yielding nectar averaging the date of June 15, ranging from the 10th to the 20th.

About the time the first blossoms begin to appear on the alfalfa, then begins haying. On account of the large acreage haying continues for three to four weeks, and by the time the last fields are cut they have attained just about full bloom, hence we have had from one to two weeks of fair honey-flow from this source—the *only* bloom and source at this season. I say *fair flow*—alfalfa seems to be a spare yielder. I have never known it to give the rapid yields obtained from white clover and basswood, especially the latter. This slowness of the flow and the limited time of its duration, often find us with the brood-combs filled and possibly just a start in the supers, and also the swarming-fever on, when the first flow is about over. So far as the great and vast acreage of alfalfa is concerned, you see it has gone into hay, a very small percent of it ever maturing to sufficient bloom to yield any nectar. As soon as the first cutting of hay has been finished, the mower begins where it started first, for in June and July the growth is so rapid with favorable seasons I have known the second haying to be done in 30 days after the first, though usually a longer time intervenes. Unless delayed, the farmer never lets his *hay* alfalfa bloom.

But there are the fence-rows, ditch-banks and here and there scattering strips and plants that continue in bloom. Also, there are fields of alfalfa sod broken and put to wheat. The heavy, tough alfalfa roots are very hard to cut with a plow, and usually enough of these escape the plow by slipping by it, in spite of three and four horsepower. To make quite a growth of alfalfa in the wheat-fields. This wheat-field bloom is necessarily scattering, a field here and there, and thin in the field, so our flow from this is seldom at all free.

The last of July and the main part of August is wheat harvest here, more being harvested in August than in July; but, bear in mind that these dates vary with latitude and alti-

tude, but in relation to each other and general application to apiculture, the principles and facts apply. In some localities and some seasons there are variations that make different results. In some places there is quite an acreage of alfalfa run for seed-crop, and this, of course, must be allowed to mature its bloom and seed, and happy indeed is the apiarist who gets such pasture for his bees, for from the beginning of the bloom to the maturity of seed is several weeks, ripe seed and bloom being on the plant at the same time, more so than red clover, but not so much as sweet clover.

You see, under these conditions we watch anxiously for the beginning of alfalfa nectar June 15, and hope and wish for a scarcity of grasshoppers and for favorable nectar-secreting weather, and hope the farmers will not push haying too rapidly.

Right with the first alfalfa flow comes swarming. The colony that swarms during the first two weeks of the flow is almost sure to do so before the first super is full, many before it is even started. Now see the drooping hopes of the apiarist—super work only just getting started, bees swarming, and, worst of all, the bloom and source of nectar rapidly falling before the mowing machines.

It will be about July 15—one month from the beginning of alfalfa bloom—before sweet clover comes on. Having failed of any paying surplus from the first flow (and this is common), we watch anxiously for a strengthening or continuance of the flow from the sparse, scattering alfalfa in the corners and wheat-fields, and for the opening of sweet clover. If the scattering alfalfa has kept up a slow flow that requires the most strong and vigorous colonies and careful management to obtain at all fair results in finish of comb honey, we are fortunate, and then if sweet clover comes on with a fair yield added to the other, we may get supers filled at the rate of about 1½ to 2 pounds daily—say a super every two to three weeks on very strong colonies, and one in three to six weeks on the more medium colonies. Contrast this, if you will, with getting a hundred pounds surplus in a two to four weeks' flow, and any experienced apiarist knows such conditions will not give good finish, and satisfactory and profitable yields, without the best of management. For ten years I have had just such experiences almost constantly. Slow and intermittent flows, in duration from about June 15 to August 15, and in quantity from a 10-pound surplus to almost a hundred-pound yield. I recall from memory such yields as 10, 20, 25, 40, 75 and 80 pounds—an average yield for 10 years of about 40 pounds.

Here I must state that such yields have not been obtained where swarming and much increase have been allowed. My yields for my locality, as herein given, have been far in excess of the average bee-keeper in this vicinity, or even in this county and adjoining ones. I do not allow swarming, nor much increase of colonies by any method. The average yield for the past ten years in this county, in the hands of any but those having more than average knowledge of the business and necessary facilities, I think has not exceeded 20 pounds surplus. Now let us see where this places the investor.

I have in mind a lady who has recently purchased a lot of bees at 85 cents a colony. Ten percent interest on this capital stock is 50 cents a colony. We will put taxes and interest both at 50 cents. In this county, sections, and foundation for the same, cost a cent a pound and upwards on the product. Let us see if I am correct. Sections in large lots—20,000 to 50,000—may be laid down here at about ¼ of a cent each; foundation ordinarily at close to 50 cents a pound in 25 pound lots, and one pound supplies full sheets for 100 sections. It costs something to put foundation into the sections, say, on an average, one person with another will put up about 1,000 sections a day, and at from one dollar to two dollars a day, let us call it ½ of a cent. There is always a slight shrinkage in the sections, but the greatest shrinkage is the unfinished sections at the close of the season. It is, indeed, a careful management and bottom prices that will produce section-honey so that the cost of the sections and foundation is kept within a cent a pound. I buy sections, foundation and cases cheaper than does the average apiarist, yet I never estimate for these items less than 2 cents a pound as the cost per pound on cased comb honey aside from the labor of scraping, and with many apiarists it costs 2½ cents a pound, easily.

Let us take the average price of comb honey here for the past ten years. One year I got \$1.45 a case, again \$1.75, still other times such prices as \$2, \$2.25, \$2.30, \$2.60, and \$2.75. This makes an average of \$2.14 a case. The past ten years the average has not been far from \$2.20 for No. 1 honey, and 25 to 30 cents less for No. 2. Now, the lady who has purchased bees at 85 per colony is not an expert—is not

even a practical apiarist. We will suppose she is able to obtain more than my estimated yield for the county, which I have put at 20 pounds for non-experts, say she obtains a case to the colony, and gets it all No. 1, she has, after deducting interest and taxes on capital invested, \$1.70 a colony. If she has 100 colonies she has \$170 as returns, and she to do all the work.

But, hold on, it is necessary to have a honey-house to carry on this business, and this, too, costs something. It also costs something to get the honey delivered to market. A smoker and other tools are needed; these all add to the cost or capital invested, upon which we must have returns, and the stock should bring again, at ordinary sale, the first cost. "Bee-bixins" if sold at forced sale, such as administrator's sale, or if the owner desires to "unload" and quit the business, ready-cash purchasers are not lying around waiting for these things at first-cost prices. The average apiarist does well to get half first cost of stock. I care not whether that stock be purchased or produced. To buy stock and then increase, the owner supplying new hives and labor to get the increase, this same increase always costs all we can get for it, unless possibly we put it into 5 or 10 cent boxes, and even then there is no profit in producing stock. Bees and bee-fixtures as an investment, are of little value. Put your money into real estate, and if you get ten percent dividend, you are fairly safe; but a dollar in such perishable and uncertain stock as bees is very poor investment indeed unless that capital outlay can be made back quickly from the product or income from the stock. Count your stock as nothing, your income as everything, and the income to pay back the capital invested and all running expenses, and pay the apiarist for his time employed. Any other basis of calculation in the bee-business is not safe.

Larimer Co., Colo.

Questions and Answers.

CONDUCTED BY

DR. C. C. MILLER, Marengo, Ill.

(The Questions may be mailed to the Bee Journal office, or to Dr. Miller direct, when he will answer them here. Please do not ask the Doctor to send answers by mail.—EDITOR.)

Moving Bees.

1. I wish to move several colonies a distance of 30 or 35 miles, either by rail or horses. They are packed for winter on the summer stands, are in 8 frame, staple-spaced hives, with four inches of packing all around and chaff on top the depth of the supers. The cases are the same size as the stand. If I leave the hive-entrance open the full width, and fasten wire-screen over the case, entrance, and to hive-stand, would top ventilation be necessary if moved now or in March?

2. Would frames need fastening if moved on bob-sleighs?

3. Would they have to be moved at night during cold weather?

4. Would it be safe to move them now, or would they do better moved toward spring, say February or March?

NEW YORK.

ANSWERS—1. Something depends on the kind of bottom-board and entrance. With a deep-bottom-board and a large entrance, there would be no need of top ventilation. With an entrance less than three or four square inches there might be danger to a strong colony.

2. Staple-spaced frames, or any fixed-distance frames, ought to need no fastening.

3. They could be moved in daylight.

4. While they might be safely moved now, there might be some advantage in moving them in early spring. The combs would be lighter then and less likely to break. There would be fewer bees present, so less danger of smothering. Some think it important that bees should have a chance to fly soon after being moved, and they would probably be able to fly sooner in March than in December.

Queens for Breeding Purposes.

I have a lot of queens all reared from the same mother; of course, the mother's bees are nicely marked and are fine gatherers. But one of the young queen's bees show to be very

finely marked and are extra-fine gatherers. Now, if one of the queens had to be used as a breeder—the young queen just mentioned or the mother—which would be the better one to use? If the young queen is used as a breeder the drones will be principally of her sisters, and if the old queen is used as a breeder the drones will be of her daughter.

2. Now, if you think I would better get a new queen to breed from please let me know where I can get one that is second to none in every respect.

SOUTH CAROLINA.

ANSWERS—1. Your question is not an easy one. The rule that has been generally given is to breed from the best. Mr. F. B. Simpson, who seems to be unusually well informed in matters of breeding, says that instead of breeding from a queen whose workers are phenomenally good, it is better to breed from one which is only a little above the average, providing the breeder is from a mother whose queen progeny are nearly uniform in character, the general average being good. In your case I think I should risk breeding from both the old and the young queen. The drones prevailing in the apiary, as you intimate, will be the sons of the sisters of the young queen. Assuming that these are the drones that will be used, if you breed from the young queen, her daughters will meet drones that have half the same blood, practically, as themselves. If you breed from the old queen, her daughters will meet drones practically of the same blood as themselves. The assumption, however, that the said drones will be the ones used, is, in most cases, not very reliable. The drones from surrounding apiaries within a radius of a mile or more must be taken into account.

2. It depends much upon the character of your present stock as to whether or not it may be a gain to get a new queen. If your stock is not good, you could improve by fresh purchase. But I could not direct you where to purchase, and for two reasons: It would hardly be fair to the other advertisers of any bee-paper to have one special breeder pointed out as the one from whom purchases should be made. In the second place, even if the publishers should allow it, I could not tell you where to get the very best, for the simple reason that I don't know. There are, no doubt, many who are trying to rear good queens, and it is possible that a large portion of them may be nearly on equal footing.

Arranging the Hives in an Apiary.

I am going to move 100 colonies of bees to the country this winter. How would you arrange them? I want to have plenty of shade and ground. I want to avoid the loss of virgin queens as much as possible.

ALABAMA.

ANSWER—With plenty of ground, you could place them regularly in rows a rod apart, each hive a rod from the nearest. That would make it all right for the virgin queens, but it would make it very inconvenient for the bee-keeper. In order to get at a satisfactory answer, suppose we talk the matter over a little. It is not so much the distance between hives that allows a bee to find its own hive as it is other things. Set a hundred colonies of bees in a row on a perfectly level plain, not a tree, bush, stump or anything of the kind in sight, and if the hives are a rod apart there will probably be more danger of bees getting into the wrong hive than there would be in a dense, natural grove with the hives only a foot apart. Let two hives be placed touching each other, and if no other hives are about there will be no danger of bees getting into the wrong hive. Have two nuclei in the same hive with entrances facing the same way and only six inches apart, and there is little danger that the bees of the right side will enter the left entrance.

Understanding this we can take advantage of it in placing our hives. Where shade is plenty, as you say it is in your case, there are trees present to help mark locations, and there would be little danger of confusion if hives were placed singly six feet apart. Suppose we place them so. As already said, there is no danger of mistake if two hives are set close side by side. So by the side of each hive already placed let us set another hive. Now put back of each pair another pair, back to back. That is, the backs of the second pair are placed against the backs of the first pair. Now we have our hives placed in groups of four, and if there is any mistake as to entering wrong hives, it will not be that any bee enters a wrong hive in its own group, but that it will enter the hive corresponding to its own hive in another group. This method of grouping I have used for years, and you will see that it allows you to have 100 colonies on a given piece of ground with just as much safety as though you had only 25 placed singly on the same ground.

Bees that Sting Intermittently—Swarming—Transferring.

1. I have a few colonies of bees I bought one year ago. I robbed them the last of June and got 17 pounds of comb honey per colony; and again the last of July I got 26 pounds of comb honey per colony; but the last time I robbed them they all fought and stung me awfully. Now I want to know why they all fought me so the last time I robbed when the first time I did not get stung at all? How can I manage to avoid stings in the future?

2. When is the best time to rob the bees?

3. Why did I have so few swarms this year?

4. When is the time to transfer? ALABAMA.

ANSWERS—1. The great probability is that when you took the honey from them the first time in June that they were at that time gathering honey freely, and at such times they feel quite good-natured and liberal, caring little how much honey you take away. When you attempted to repeat the operation the last of July, it is likely they were getting little or nothing from the fields, with plenty of time and disposition to resent any purloining of their hard-earned stores. Even if they did considerable storing afterwards, there may have been a lull in the harvest the latter part of July. It is also possible that you were not quite so careful the second time about exposing honey so as to attract robbers. If you do anything with bees in a time of scarcity, avoid having hives open longer than is absolutely necessary, and take great pains not to have supers of honey exposed to the robbers. It may also be a little safer to work late in the day, so that darkness coming on may close the efforts of any bees with ambition to obtain a reputation as highway robbers.

2. Better take away all surplus as soon as the flow ceases, or as soon as they gather no more than suffices for their daily needs. Something can be told about this when you find that the amount of honey in the supers is not on the increase, and at such times the very fact that the bees are unusually cross and inclined to rob may make you suspect that they are not gaining in stores.

3. Very likely the character of the season had something to do with their not swarming, although other causes may have prevailed. Without knowing any more particulars, it would be pure guessing to say what.

4. You may transfer in fruit-bloom, or three weeks after the first swarm.

words. When to the difficulty of pronouncing correctly is added the difficulty of choosing the right words and using them in the right way, I give up in despair. I have no hope of ever learning to use the English in a faultless manner. But I am by no means in despair as to improving. I'm not as bad as I was a year ago, and not nearly as bad as I was 25 years ago. I'm willing—I'm anxious to learn. I consult the dictionary oftener than ever before. There is no surer way for a friend to command my gratitude than to call my attention to some error in my use of the English language.

And now Prof. Cook wants me to act as arbitrator between him and that man Hasty. He wants me to say whether "larva" or "worm" is the right name for the thing that destroys our nice combs when we neglect them. Frankly, I don't know. But having made this confession of ignorance, I want to emphasize in the strongest manner the fact that I believe we should constantly be striving for a single name for each idea, and a single idea for each name. We may not achieve that in the present generation, but we ought in general to speak and write in such a way as to have little fear of having any one draw the dictionary on us.

One trouble in the present case is that Prof. Cook speaks as a scientist, and our sprightly "afterthinker" as a layman. An entomologist could hardly be forgiven for calling that which hatches from the egg of a bee a worm; a bee-keeper would not be likely to call it anything but a "larva;" but the average person who knows nothing about bee-keeping would be very likely to call it a worm. And the dictionary would justify him. For the dictionary says a worm is (third definition): "In popular and archaic use, any creeping or crawling animal, whether large or small, as a serpent, grub, caterpillar, or the like." That same definition justifies Mr. Hasty in calling the larva of the bee-moth a worm. Prof. Cook is saying that an added syllable should not stand in the way of correctness. Mr. Hasty may reply that several syllables must be added if we would not be misunderstood. If we should say, "I lifted a comb out of the hive and found in it hundreds of larvae," he would be understood to be speaking of young bees. "Hundreds of worms" would be understood correctly, and is very much shorter than "hundreds of larvae of the bee-moth." Then think of the difference between saying "wormy combs" and "combs infested by the larvae of the bee-moth."

Prof. Cook has scientific accuracy on his side. On the other side is economy of words and a dictionary definition. Gentlemen, please settle it between you. C. C. MILLER.

McHenry Co., Ill.

"HOME, SWEET HOME."

What a picture we have in that home of the old patriarch, Jacob, which we have had in the Sunday-school for the past two Sundays. Jacob commenced life in a bad way. If any one thing savors more of heaven on this earth of ours than another it is real accord among children of the same home. If any one thing smells more of perdition it is hatred and meanness among the boys of any household. Jacob's lying and imposture to cheat Esau was morally as black as blackest night. No wonder his later years come full burdened with sorrow. Then, too, polygamy came to blight his home. What a sorry blot that would be in any home. Glad we have wiped it from our body politic. *Our favorite wife.* Only to think of the sore feelings and bitter heart-aches that would come into any home when a favorite wife held sway. She must be favorite or there never would have been but the one. How the record states plainly that she was favorite.

I am superlatively glad that Roberts was pushed from his seat in Congress. The home circles of our country should always frown on anything that tends to mar the home or lessen family accord. Let it be known that of all Jacob's sons Joseph was the favorite. What a blunder! The parent who has favorites or shows favoritism among his children should never have had a home. Yes, I know children differ, and some are lovely and wise, and some are otherwise. Then what a privilege has the parent of taking the less fortunate so snugly in the arms of his love that the unloveliness will be snugly squeezed out—all out.

Joseph was exceptional in mainly strength and beauty; was able to get the most out of life and experience; was a very Hercules in moral strength and rectitude; yet even Joseph in such a polygamously tainted household could not pass unscathed. His very ambition and confident ability, no doubt, gave rise to the dreams. His warranted belief in his own power and strength, aided, maybe, by his ambition, gave him visions which made possible a right interpretation of the dreams. How lovely it would have been could he have kept the

USING THE ENGLISH LANGUAGE CORRECTLY.

You might not think it, but a single line of Prof. Cook's, on page 698, has sent me off into a brown study of many minutes—minutes that I can hardly afford when I'm so crowded that there's scarcely a minute to spare. One of the hardest jobs I've ever tackled is the one of trying to use the English language correctly. And in my brown study I've gone over a good deal of the whole ground of getting the little or much that I know of spelling, punctuation, pronunciation, choosing the right words, putting them in proper order, etc.

As to spelling. I was brought up under the old regime—stood up in a row and "trapped to the head" as often as I could, or "spelt on sides," and was always one of the first chosen—and so I'm rather proud to say that I'm exceptionally familiar with our present system of spelling, and ashamed to say that I can do so little to prevent the rising generation from going through the same drudgery that I did in mastering a spelling that is a disgrace to a civilized nation.

Punctuation—the whole thing is more or less a mystery to me, and about the most I attempt is to sprinkle in a few commas here and there so the printer will not take exactly the opposite of the intended meaning; and then I look up to him as a superior being who will put in semi-colons and things in the right places, so that other people can understand what I'm trying to say.

It would make a book of no small size to tell all the tribulations I've been through in trying to learn to pronounce correctly. The times that I've consulted the dictionary! And the worst of it is, that I'm not sure of speaking ten consecutive sentences to day without mispronouncing some word or

dreams and their meaning to himself. But, no, he must tell. I fear the show of boasting may have been present to sting the already jealous and sensitive brothers. He could not have noticed their unrest and displeasure at the narration of his dream. Was it kindly, then, or modest, for him to tell of the second dream? The less was this true in that it reached to the father who was to become subject to the son. Surely, those wicked brothers—and they were horribly wicked—were in the way of some potent influences which must have fed and nourished powerfully the rancor, hate and jealousy that resulted so disastrously.

Joseph's misfortunes certainly developed in him a character magnificent almost beyond compare. That the brothers were won in part from their evil thoughts and practices is as surely true. Maybe many of us are most fortunate in the irritating, vexations, experiences that come to torment us.

THE SUNDAY-SCHOOL.

I find a rich treat in the Sunday-school. My father always went with me to Sunday-school. He was for years the superintendent. I early learned to love the study and discussions. How different it might have been had not my father cared for these Sunday privileges. Nothing could keep father away. How could I but learn to respect this service? I have always followed in my father's steps. My children were the companions of myself and wife as we almost invariably went each Sunday to study that masterpiece in all literature.

Today my son teaches regularly a large class in a large and influential Sunday-school. A little son has just come to that home. How happy I am in the thought that "Little Albert" will grow up to attend and love the Sunday-school and all the blessed teachings that it hands over to its patrons. In just such influences lies the safety of our children. Such teachings give to our nation a grand citizenship. We stand appalled before the dastardly act of the anarchist. Anarchy can never sprout in the blessed seed-bed of the Sunday-school.

I am teacher of a large Sunday-school Bible class of over 30. There are seldom less than that number in the class. Yesterday we had a gentleman and his wife with us who are not wont to come. The father told me that he did not know it was so interesting. He assured me that they would come regularly. I am rejoiced. They have three bright boys. One, the oldest, a very promising boy in many ways, with two

other boys, ran away last year, and were gone, to the great sorrow and agony of the parents, for days. The Sunday-school does not favor such escapades. It is almost sure to replace any wish to do so with a better ambition. But if we wish our children to love and benefit by the school, we must love and benefit by it ourselves. We often need its beneficent influence fully as much as do the dear children.

Oh, how glad I am that my father loved such things! How richly his tendencies and habits in all these good ways taken hold of my own life, and, through me, they have been passed on to bless my children and my grandchildren. Can we do a more patriotic thing than to go each Sunday with our children to a good Sunday-school?

A MINING TOWN SUNDAY-SCHOOL.

As a child I was never strong. While I remember my college life as most delightful and as the best part of my whole life, my poor health, however, was a constant menace to its continuance. So this life was not all roses.

I stepped from college much broken in health, and came to California to mend it. I secured a school in a rough mountain town. There was no church there, and so far as I know I was the only professed Christian. The children, however, were just as interesting as others, and, I thought, full of promise. Sunday was the busy day. Stores were all open and business was at its flood. Drunken brawls were very common on Sunday. I at once started a Sunday-school. The mothers—bless the mothers!—and the children, largely came. Only one man. He loved music, and played the little organ which he loaned each Sunday. It was a good Sunday-school. I knew it did good. I desired a library. The day-school director, also the leading merchant, came to me one evening. He said he had heard how interesting the Sunday-school was: wished he could come, but, of course, he couldn't. Asked if he could be of service. I suggested the need of a library. He said "You shall have it." He inquired the amount of money needed for the purchase. I said anywhere from \$50 to \$1,000. The next day "A Sunday School Ball" was advertised. I was invited to the ball, and did look in. We received over \$200 and an excellent library. I feel sure that Sunday-school added to the sum total of the world's happiness, and I know that better citizens were the result of its influence and teachings.

Reader, may not you be able to work in the same way?

Bees in Fine Condition.

The weather is fine with bees flying nicely, and gathering pollen yesterday. Honey was a very light crop through this part of Wisconsin the past season. My bees—4 colonies—go into winter quarters in one condition, although I had to feed some 20 to get them so.

Grant Co., Wis., Nov. 2.

L. G. BLAIR.

Honey Crop Short.

The bee-papers seem to strike snags in estimating the honey crop. In this locality it is short; and this locality embraces the territory in Pennsylvania and New Jersey about the famous Delaware Water-Gap. We have calls daily for honey, and some of them come from considerable distances.

I handle the bees for my son—I do most of the "chinning," and he most of the suiling. But about that honey crop: We started last spring with 11 colonies, increased to 15 by natural swarming, and averaged 30 pounds of comb honey, spring crop. A wet spring brought an abundance of white clover, but a drought followed and killed it. Blackwheat came on at a 2-40 gait, and the frequent rains wiped that out, so that the bees did not get in over a good week's work; they were just fairly started when their hopes were blasted. We, with others, had great expectations, and prospects were unusually bright for awhile, but the pulling in winter-wind failed to work—we counted the chicks a little too soon.

We are right proud of a certain queen we

For Thanksgiving Day

The Nickel Plate Road will sell tickets within distances of 150 miles Nov. 27 and 28, at rate of a fare and one-third for the round trip. Tickets good returning until Nov. 29, inclusive. This road has three express trains daily to Fort Wayne, Cleveland, Erie, Buffalo, New York and Boston, with vestibuled sleeping cars. Also excellent dining-car service; meals served on Individual Club Plan, ranging in price from 35 cents to \$1.00. For reservations in sleeping-cars or other information address John Y. Calahan, General Agent, 111 Adams St., City Ticket Office, 111 Adams Street, Chicago. Phone 2057 Central.

42 46A2t

bought. We couldn't catch the little black vixen, so we appropriated her brood and young bees, and started our new queen on her way rejoicing. All the little blacks are gone now, and the yellow ones are pushing. They are gentle as kittens, and seem very energetic. We wish all the other colonies were as gentle.

Now, say, let's have a little gossip behind the door. Wonder what's become of A. I. Root's trap-net. Wonder if he won't blossom out next with a rooster having a pencil over his ear, and a tablet to keep tally, raising a racket with some old biddy that disputes his account; and then, again, how would he decide the matter? But I believe he would get the feathers all smoothed the right way, don't you? A. C. HUX-BEIGER.

Northampton Co., Pa., Oct. 28.

Season a Failure—Bee-Management

My bees were a total failure the past season. I got practically nothing—just a few scrawny sections from 120 colonies. This is a jackline (?) country, and nearly all soil is sand, and nearly everything was dried up by the hot weather; still the bees gathered enough for winter. I have used the screen-ware in the center of the bottom-board for two years. I think it is a grand thing, especially in swarming-time and in winter, that is, if you put them in the cellar.

This is the way I run my bees for honey and increase. As soon as I see that they are getting pretty strong in the spring, I prepare a hive-body with a queen-excluder nailed to the bottom-board, put this body on a medium colony. Now, as fast as I can find drone-combs sealed up, I take it out and put it in my prepared hive, boring a 1/4 inch hole in the back, so the drones or bees can come out. I use a drone-trap on this as soon as the drones hatch out; then if I have an extra queen cell I put it in here, and as soon as the queen hatches I take away the trap.

Now, my theory is, that by taking out

BEST

Extracted Honey For Sale

ALL IN 60-POUND TIN CANS.

Alfalfa Honey

This is the famous White Extracted Honey gathered in the great Alfalfa regions of the Central West. It is a splendid honey, and nearly everybody who cares to eat honey at all can't get enough of the Alfalfa extracted.

Basswood Honey

This is the well-known light-colored honey gathered from the rich, nectar-laden basswood blossoms. It has a stronger flavor than Alfalfa, and is preferred by those who like a distinct flavor in their honey.

Prices of Alfalfa or Basswood Honey:

A sample of either, by mail, 10 cents, to pay for package and postage. By freight—two 60-pound cans of Alfalfa, 8 cents per pound; four or more cans, 7½ cents per pound. Basswood Honey, 12 cent more per pound than Alfalfa prices. Cash must accompany each order. You can order half of each kind of honey, if you so desire. The cans are boxed. This is all

ABSOLUTELY PURE HONEY

The finest of their kinds produced in this country.

Read Dr. Miller's Testimony on Alfalfa Honey:

I've just sampled the honey you sent, and it's prime. Thank you. I feel that I'm something of a heretic, to sell several thousand pounds of honey of my own production and then buy honey of you for my own use. But however loyal one ought to be to the honey of his own region, there's no denying the fact that for use in any kind of hot drink, where one prefers the more wholesome honey to sugar, the very excellent quality of alfalfa honey I have received from you is better suited than the honeys of more marked flavor, according to my taste.

McHenry Co., Ill.

C. C. MILLER.

Order the Above Honey and then Sell It.

We would suggest that those bee-keepers who did not produce enough honey for their home demand this year, just order some of the above, and sell it. And others, who want to earn some money, can get this honey and work up a demand for it almost anywhere.

GEORGE W. YORK & CO., 144 & 146 Erie St., Chicago, Ill.

nearly all the drones, and making a hole from 4 to 6 inches square in the center of the bottom board, with wire-cloth nailed on both sides, they keep cool and travel upward into the sections. If there are many robber-bees prowling around simply make small entrances.

Oseola Co., Mich., Oct. 21. C. CRANK.

Report for the Past Season.

I have 38 colonies at present. I wintered 18. The bees did well the forepart of the season, but it got too dry in July, and has been ever since. I sell my honey for 15 cents a pound, and can sell all I have. I sell to the consumer only. I will have about 1200 pounds this season. I have very good bees.

G. W. KREAMER.

Audubon Co., Iowa, Sept. 1.

White Snake-Root—Poor Season.

What is the name of the enclosed flower? I think it is sweet clover. The bees work on it, and as it is a very late bloomer it must be valuable for honey. The first I have noticed was this year.

My bees have done very poorly—have not as many colonies now as I had in the spring, and from 50 I have not received enough honey for home consumption.

R. N. CRAFTON.

Cherokee Nation, Ind. Ter., Oct. 22.

[The flower in question is not the sweet clover, but the white snake-root—Eupatorium ageroides—and belongs to the Composite family, as the great majority of our late flowers do. In previous reports we have taken occasion to say that nearly all the composite flowers produce honey to some extent, and while we can give no definite reply as to the quality of this particular species, yet, if the bees take kindly to it, they are doing better on it than they could elsewhere.—C. L. WALTON.]

Report for the Season of 1901.

I put six colonies into winter quarters last fall, but some of them were weak last spring. I increased to 12 colonies by dividing, besides having some natural swarms, so that I now have 19 colonies in a tolerably good condition for winter. I got between 300 and 400 pounds of first-class white clover comb honey, which I can readily sell at the house for 15 cents per pound.

I had two cases of drone-laying workers this season, from queens that the bees reared in the colonies I divided. I killed them, and gave them other ones. I had one case of a drone hatching out of a good-looking queen-cell; I am sure it was a drone, for while I was examining that colony I killed it. I had one colony that I made last spring by dividing, that has filled the hive and given me two supers of honey, and now the third is all but full.

I am well pleased with the American Bee Journal, and the information I have gotten from it; I will not give it up as long as I keep bees.

Tested Queens.

A question that will some of these days need to be supplied with a new answer is this: "What is a tested queen?" The answer *has been*. "A queen whose three-banded workers show that she is pure Italian in origin and mating." But since the entrance of five-banded, as the editor correctly says, page 790, there may be black blood in a queen which produces three-banded workers. That knocks out the old answer. What shall the revised answer be? Don't ask me. I don't know.—[This is one objection to the raising of five-banded bees. But that objection would have no weight with me, providing I could see in color greater longevity or more pounds of honey.]—EDITOR.—Stray Straw in Gleanings in Bee-Culture.

Rearing Queens in Nuclei Without Cessation of Laying.

B. Beuhne, in the Australian Bee-Bulletin, after telling of failures in introducing queens in the usual nailing cages, says:

I next tried the nucleus plan. Starting a nucleus alongside the colony the queen of which was to be replaced, and after the young queen in the nucleus had commenced to lay, I removed the old queen of the hive and united colony and nucleus. Observing the usual precautions of uniting I never had a mishap; but the drawback was that it required the operation of making a nucleus to be gone through for every colony so requested. To avoid this I established a number of permanent nuclei, and whenever I wanted a queen I went to a nucleus, took out a frame with queen, brood, and bees, and inserted it into the place of one received from a colony, and together with the queen it was given to the nucleus, where the queen could go on laying till the young queen emerged from a cell given it. I may here state that when a queen is more than two years old I do not remove her when giving a cell (in a protector), and in three cases out of four the virgin queen will take no notice of the old queen, and in due course commence to lay, when she may be removed and another cell given. Thus the nucleus is never queenless, and gradually increases in population.

In some cases I have had two and three old queens in a nucleus all winter on the same combs. The jealousy so marked in a young queen is quite gone after the second season, and such a queen is not considered a rival even by a virgin queen. On this point doubts of the correctness of this reasoning have been expressed to me, and to anticipate such doubts I may state that I have proved the point by various demonstrations to many beekeepers who have visited my apiary, and who can bear out my contentions.

Bees on Shares.

Contrary to the advice of some of the sages of bee-culture, many of the people in the Colorado are working bees on shares, and getting a start in the business without any great cost to themselves aside from their labor. And this chiefly follows from the fact that there are a number of retired apiarists in the State. Yes, men who have actually accumulated a competency from the production of honey. Another class, owners of bees, but unskilled in their management, lease their bees to practical apiarists, and make a handsome percentage on their investment.

In the Eastern States, where bee-keeping is about as certain to prove remunerative as rain is to fall on the Mojave desert, and where winter losses are sometimes appalling, both parties are apt to be disappointed and dissatisfied (especially the owner of the bees), and trouble is liable to follow. But in the irrigated portions of the West, where reverse

The Bee-Keeper's Guide:

Or, Manual of the Apiary.

—BY—

PROF. A. J. COOK.

460 Pages—16th (1899) Edition—18th Thousand—\$1.25 postpaid.

A description of the book here is quite unnecessary—it is simply the most complete scientific and practical bee-book published to-day. Fully illustrated, and all written in the most fascinating style. The author is also too well-known to the whole bee-world to require any introduction. No bee-keeper is fully equipped, or his library complete, without THE BEE-KEEPER'S GUIDE.

This 16th and latest edition of Prof. Cook's magnificent book of 460 pages, in neat and substantial cloth binding, we propose to GIVE AWAY to our present subscribers, for the work of getting NEW subscribers for the American Bee Journal.

Given for TWO New Subscribers.

The following offer is made to PRESENT subscribers only, and no premium is also given to the two new subscribers—simply the Bee Journal for one year:

Send us TWO NEW SUBSCRIBERS to the Bee Journal (with \$2.00), and we will mail you a copy of Prof. Cook's book FREE as a premium. Prof. Cook's book alone sent for \$1.25, or we club it with the Bee Journal for a year—both for only \$1.75. But surely anybody can get only TWO NEW SUBSCRIBERS to the Bee Journal for a year, and thus get the book as a premium. Let every body try for it. Will YOU have one?

GEORGE W. YORK & CO.,

144 & 146 Erie Street, CHICAGO, ILL.

Please mention Bee Journal when writing advertisers.

conditions prevail, things generally go along smoothly, provided both parties observe the letter and spirit of their agreement.

In taking bees on shares, the Journal, in all cases, advises its readers to have a written contract, covering every feature of the agreement and providing for every probable contingency that may arise. This precaution should be taken, no matter how honest and good-intentioned the parties may be; the chances for misunderstandings and consequent trouble will be reduced to a minimum; and, besides, it is business.

The share given for the use of the bees varies according to conditions. Where a few colonies are picked up here and there and managed with another outfit, 15 pounds per colony is considered a fair compensation, if the season is good, and less if it is poor.

When entire apiaries are leased, including all necessary fixtures and ground furnished for apiary, the lessee performs all the labor, enlarges the owner with half the expense of sections, foundation, shipping-cases and new hives, and at the end of the season the proceeds are divided; that is, each takes one-half of the honey and one-half of the increase. It is usually stipulated that the share of honey belonging to the bee-owner shall be delivered to him cased, graded and ready for market.

The Journal will sum up the matter by saying: If you can not get a start in bee-keeping in any other way, take them on shares. But if you can borrow money, even though you have to pay 15 to 25 percent for it, better do that and buy your bees outright. You would gain financially in an average season by the latter plan.—Rocky Mountain Bee Journal.

An Aid in Setting Foundation.

In placing foundation on the wires in broad or half-depth frames, I find that the inbedding can be done much better with a small toothed wheel, used for the purpose, by doing the rolling over a block or board covered with burlap. A piece of tapestry carpet reverse side up, would answer. This is much better than rolling on a board. I cut a board just big enough to fit in the inside dimensions of an empty frame, and stretch the burlap over it, tacking around the edges with two or four ounce tacks; nail this board on a wider piece. After the foundation is secured in the slotted top-bar of the frame, the latter is placed over the "form" or block, and the rolling done as usual.—M. F. KEEVE, in American Bee-Keeper.

The Colorado Convention, to be held at Denver, Nov. 18, 19 and 20, promises to be one of the very best ever held by that excellent Association. In connection with the interesting program, a summary of which appears on page 675, Secretary D. W. Working has since sent us the following, which must prove of special interest to our Colorado readers:

Prof. Gillette will be prepared to measure "long tongues," and show them under the microscope.

PREMIUM LIST.

Great Combination Subscription Offers.

Combination and concentration in business are the magic watchwords of the age in which we live. Why should it not be applied to the matter of subscriptions to magazines and periodical literature in general? We believe it is a wise move, especially when it is in the line of economy for the reading public. Now, if we can be the means of **saving** our subscribers **several dollars** a year on their reading matter, and at the same time help them to the best literature published to-day, we shall feel that we are doing a good thing, indeed.

We have entered into an arrangement whereby we can furnish the following excellent periodicals at greatly reduced prices:

	Regular price.	THE DOLLAR PAPERS.	Regular price.
Review of Reviews	\$2.50	Cosmopolitan Magazine	1.00
Current Literature	3.00	Frank Leslie's Popular Monthly	1.00
New England Magazine	3.00	The Household	1.00
Leslie's Weekly	4.00	Good Housekeeping	1.00
North American Review	5.00	The Designer	1.00
		Success	1.00

PLEASE NOTICE that in all combinations **Success** and the **American Bee Journal** must be included.

Here is our List of Liberal Offers:

American Bee Journal and Success

with any <i>one</i> of the above dollar magazines	\$2.50
with any <i>two</i> of the above dollar magazines	3.00
with any <i>three</i> of the above dollar magazines	3.50
with the Review of Reviews (new)	3.00
with Current Literature (new)	3.00
with New England Magazine	3.00
with Review of Reviews (new) and any <i>one</i> of the dollar magazines	3.50
with Leslie's Weekly	3.75
with Review of Reviews (new) and Leslie's Weekly	4.75
with North American Review (new) and Review of Reviews (new)	5.00

If a **renewal** subscription is wanted for the Review of Reviews, Current Literature, or the North American Review, add \$1.00 for each renewal subscription to the combination prices named above. On all the other combinations a renewal counts the same as a new subscription.

No foreign subscribers can take advantage of these combination offers.

We shall be pleased to have our readers examine carefully the above list, and send us their subscriptions. Address,

GEORGE W. YORK & CO.

144 & 146 Erie Street, CHICAGO, ILL.

Bee-Farming by Irrigation.

Alfalfa, as is well known, is a great honey-producer. As under irrigation it produces several crops a year, with bloom with each crop, the bee-farmer who locates his hives of bees among alfalfa fields is sure of a large honey crop.

General Farming Under Irrigation

is also scientific and devoid of the element of chance. Crops are sure, yields larger, quality better, and prices higher, with no risk of wet weather damage in harvest.

Wheat yields 50 bu.; oats, 100 bu.; potatoes, 300 bu.; alfalfa, five tons regularly each year.

Under the popular and successful

Wilson Irrigation Settlement Plan

it is possible to get a well-irrigated farm possessing the requisites of abundance of water, rich soil, home markets, good society, etc., for little money and on easy terms.

We share profits with those who can advance all cash. Write for Bulletin giving full details. Agents wanted.

Homestead Land and Irrigation Company,

79 DEARBORN STREET, CHICAGO, ILL.

- Best five pounds of beeswax—1st prem., \$3; 2d prem., one Higginsville section press, offered by Barteldes & Co.; 3d prem., one annual subscription to the Rocky Mountain Bee Journal, given by H. C. Morehouse.
- Heavies: section No. 1 separated honey—50 cents.
- Heaviest section No. 1 honey—50 cents.
- Best quart bottle of honey-vinegar—1st prem., \$1; 2d prem., one No. 1 bee-veil, offered by Barteldes & Co.; 3d prem., one annual subscription to the Rocky Mountain Bee Journal, offered by H. C. Morehouse.
- Best exhibit of honey-cakes and candies—1st prem., \$2; 2d prem., one copy of "Langstroth on the Honey-Bee," offered by the Colorado Honey-Producers' Association; 3d prem., one annual subscription to the American Bee Journal, offered by George W. York & Co.
- Best display of comb honey—1st prem., one Rauchfuss section press, offered by Rauchfuss Bros.; 2d prem., one platform scale, offered by the Colorado Honey-Producers' Association; 3d prem., one annual subscription to the Rocky Mountain Bee Journal, offered by H. C. Morehouse.
- Best exhibit of bees in observatory hive—1st prem., five K. O. Colorado dovetailed hives, offered by the Colorado Honey-Producers' Association.
- Judges' premiums—One swarm catcher and one Lewis section press, offered by the Colorado Honey-Producers' Association; seeds worth \$1.50, offered by the Lee-Kinsey Implement Co.; one annual subscription to the American Bee Journal, offered by George W. York & Co.; one annual subscription to the Rocky Mountain Bee Journal, offered by H. C. Morehouse; and a number of special premiums, which can not be definitely announced at this time, are reserved to be awarded at the option of the judges for creditable exhibits not named or not adequately recognized in the foregoing list.

RULES AND CONDITIONS.

- Every article which wins a cash premium shall become the property of the Association, to be placed on exhibition in the Association's case in the rooms of the Board of Horticulture. Other exhibits remain the property of the exhibitors.
- No article may compete for more than one premium. For illustration, a case of honey entered for premium No. 1 may not be included as part of a display entered for premium No. 12.
- No honey shall be entered for a premium unless produced by the exhibitor.
- Exhibits may be entered at any time during the first day of the session, Nov. 18, preferably during the forenoon. Persons desiring to send exhibits to Denver by express may send them to the Colorado Honey-Producers' Association, 1440 Market Street, and they will be properly entered.
- Only members of the Colorado State Bee-Keepers' Association may compete for premiums; but any bee-keeper desiring to do so may enter exhibits by joining the Association at the same time. The membership fee is \$1.00.
- Honey entered for premiums numbered 1, 2, 3, 6, 8 and 9 must conform to the grading rules of the State Association. No 1 honey will not win the premium offered for No. 2. Any prospective exhibitor may have a copy of the rules for the asking.
- Exhibits are to be entered by number, and known only by number until after the premiums are awarded. Entry cards will be furnished and filled out by the secretary.

The exhibition, with cash premiums offered by the Association and special premiums offered by its friends, is a new feature. The pity is that it could not have been announced

three months ago, so that the best honey could have been saved for exhibition. Members are urged to make the best possible use of the opportunity offered, to bring the best honey and other products typical of our industry, and to prepare their exhibits so that they will show to the best advantage. The place of our meeting will not be as large as last year, but bee-keepers and others interested in bees and honey. The premiums are worth contesting for because of their value. The honor of winning will be worth more than the premiums themselves. The judges will be chosen with a view to secure absolute fairness, as well as ability to judge justly.

D. W. WORKING, Sec.

CONVENTION NOTICES.

Chicago.—The executive committee of the Chicago Bee-Keepers' Association has ordered that the next meeting be held all day and evening, Dec. 5, 1901, at the Briggs House club-room. This is arranged on account of the low rates to be in force then for the International Live-Stock Exposition in Chicago at that time (Nov. 30 to Dec. 7), being one fare plus \$2.00 for the round-trip. This notice goes by mail to nearly 300 bee-keepers in Chicago and should result in the largest attendance we have ever had. Dr. C. C. Miller and Mr. C. P. Dadaud have promised to be present. Let all come.

HERMAN F. MOORE, Sec.

GEORGE W. YORK, Pres.

Colorado.—The Colorado annual meeting promises to be a genuine success. The program has been made out for a number of days and is almost ready for publication. It has come to be a privilege and an honor to read a paper before our Association, and so very few decline who are invited to write or speak at the convention. One paper is already in the hands of the secretary. On two or three nights a big magic lantern will illustrate talks by famous students of bees and the bee industry. After the result is going to have an exhibition of the choicest honey in the United States (made in Colorado, you know), and wax, with bees enough to show "how the thing is done."

If you want to know more, or have forgotten the dates (Nov. 18, 19, 20), write to the undersigned, box 432, Denver, Colo.

D. W. WORKING, Sec.

Minnesota.—The Minnesota Bee-Keepers' Association will meet in Plymouth Church, Cor. 8th St. and Nicollet Ave., Minneapolis, Minn., Wednesday and Thursday, Dec. 4 and 5, 1901. Mr. W. Z. Hutchins will give a stereoscopic lecture on Wednesday evening, and a good program is prepared and now in the hands of the printer. Joining the Association will be an association in a body will be voted on Wednesday. All bee keepers and those interested in bees are invited.

H. G. ACKLIN,

Chairman Executive Committee.

Illinois.—The Illinois State Bee-Keepers' Association will hold its 11th annual meeting Nov. 19 and 20, 1901, in room 17, at the State House, in Springfield. As there will be no set program we expect every one to come prepared to ask questions and answer those asked by others. Those who attend our meeting can avail themselves of the (Central Passenger) railroads as follows: The Central Passenger Association has made an open rate of one fare for the round trip. Other roads not in the Central Passenger Association will at least give a rate of a fare and a third for the round trip; and it is expected the roads will all meet the one-fare rate. There is no better way for beekeepers to save a lot of money, and save themselves of the cheap railroad rates, and turn out to the meeting; and, if they wish to get a discussion on some particular topic, just write a short paper on the same, and read the discussion will follow.

JAS. A. STONE, Sec.

R. R. No. 4, Springfield, Ill.

The "MAGAZINE-AGE,"—Never since printing began has periodical literature been so rich, varied and attractive as at present. A laudable artistic rivalry among publishers has brought their productions to a high pitch of excellence, while unusual activity, ingenuity and lightning energy has pushed circulation from city to city across the country over. keen competition has also brought the price of excellent magazines to a point so low as to touch the pocket lightly. All this has resulted in making us a nation of magazine readers. Where one family formerly indulged in a single magazine and counted it a luxury, fifty now look upon it as a necessity. Pro-

gressive people, indeed, feel that they can hardly keep well abreast of the times without reading three or four magazines each month. Ordinarily this would entail no little expense, but right here the remarkable clubbing offers arranged by the magazine Success, of New York City, afford most substantial aid by making an average cut of one-half on the leading periodicals. Through these offers, in fact, one can in some cases secure four favorite magazines for the price of one, as may be gleaned from a detailed announcement on page 734 of this issue. The offer would not be possible save for the co-operation of several periodicals in this advertisement, thus effecting a material saving to all concerned—especially to magazine readers.

HONEY AND BEESWAX

MARKET QUOTATIONS.

CHICAGO, Nov. 1.—The market is easier in tone, while prices are nominally the same, but would be shaded to effect sales. Some cars of honey enroute to the Eastern cities have been diverted to this and surrounding points, which is having a depressing effect. Comb bring 144-15c for best grades of white; light amber, 142-13c; dark grades, 100-11c. Extracted, white, 55-56c; according to quality, flavor and packaging; light amber, 51-52c; c. amber and dark, 50-51c. Beeswax, 28c. R. A. BURNETT & CO.

CINCINNATI, Oct. 25.—The honey market is rather dull on account of the warm weather. Extracted sells only to manufacturers from 50-55c; better grades alfalfa water-white from 60-61c; white clover from 50-55c. Fancy white comb honey sells from 15-16c. C. H. W. WEBER.

ALBANY, N. Y., Oct. 25.—Honey in good demand now this is the most satisfactory time to sell. Grocerymen are stocking up and will buy limes, when late they only buy enough to piece out. Fancy white comb, 15-16c; mixed, 14-15c; buckwheat, 12-13c; clover, 10-11c; 6-7c; mixed, 6-7c. H. R. WRIGHT.

OMAHA, Oct. 25.—New comb honey is arriving by express from California, from Kansas and Colorado, and selling at \$3.50 per case in a retail way. California extracted honey is being offered carlots at 4-4-1/2c per pound, f.o.b. California shipping points, but the bulk of the honey of any sales having been made thus far. The production of extracted honey seems to be quite large this year in Colorado, Utah and California. PEYCKE BROS.

NEW YORK, Oct. 18.—Comb honey is in good demand and finds ready sale at the following quotations: Fancy white, 15c per pound; No. 1 white, 13-14c; amber, 12c; buckwheat, 10-11c. Extracted rather quiet at 60-65c for white, and 5-5-1/2c for amber. Beeswax rather quiet at 27-28c. HILDRETH & SOELEN.

BOSTON, Oct. 21.—There is a fairly good demand for stocks with ample supplies at the present prices. Fancy white, 15c per case, 15-16c; No. 1, in cartons, 15-15-1/2c; No. 1, 15c; very little No. 2 is being received; glass-front cases will bring about 5c per pound less. Light California extracted, 10-11c; Florida honey, 6-7c. BLAKE, SCOTT & LEE.

DES MOINES, Oct. 25.—There is very little doing here in new crop of honey. Some small lots of near-by produced comb honey are on the market and selling in a retail way at \$3.50 to \$3.75 per case. We do not look for much trade in this line before Sept. 1. Our market does not consume a great deal of extracted honey. PEYCKE BROS. & CHANEY.

DETROIT, Oct. 25.—Fancy white comb honey, 14-15c; No. 1, 13-14c; no dark to quote. Extracted, white, 6-7c. Beeswax, 25-26c. M. H. HUNT & SON.

SAN FRANCISCO, Oct. 20.—White comb, 10-12 cents; amber, 7-9c; dark, 6-8c. Extracted, white, 5-5-1/2c; light amber, 4-4-1/2c; amber, 4-4-1/2c.

Not much arriving here, nor are spot stocks of large proportions, either of comb or extracted. While demand is not brisk at full current rates, buyers are not able to obtain noteworthy quantities in their favor, especially where most desirable qualities are sought. Beeswax, good to choice, light, 20-22c; dark, 24-25c.

KANSAS CITY, Oct. 25.—Up to the present time only small lots of new comb honey have been on the market, and these met with ready sale on the basis of 15-16c per pound for fancy white. For next week heavier receipts are expected and quotations are issued at \$3.00-3.25 per case for large lots, which would be equal to about 14-15c; the demand being quite brisk, a firm market is anticipated. Supplies of extracted are a little more numerous, but large buyers still seem to have their eyes too low. In a small way 5-5-1/2c is quotable. PEYCKE BROS.

A New Bee-Keeper's Song—

“Buckwheat Cakes and Honey”

Words by EUGENE SECOR.

Music by GEORGE W. YORK.

This song was written specially for the Buffalo convention, and was sung there. It is written for organ or piano, as have been all the songs written for bee-keepers. Every home should have a copy of it, as well as a copy of

**“THE HUM OF THE BEES
in the APPLE-TREE BLOOM”**

Written by
EUGENE SECOR and DR. C. C. MILLER.

PRICES—Either song will be mailed for 10 cents (stamps or silver), or both for only 15 cents. Or, for \$1.00 *strictly in advance* payment of a year's subscription to the American Bee Journal, we will mail both of these songs free, if asked for.

Texas Bee-Keepers.

New Branch Office. We beg to announce the opening of a branch office and warehouse at 438 W. Houston St., San Antonio, Texas. Rates of transportation from Medina in less than car-load lots are high, and it takes a long time for a local shipment to reach Southern Texas points.

Low Freight and Quick Delivery.

San Antonio as a Shipping-point.

To secure these two necessary advantages—low freight and quick delivery—and to be better prepared to serve the interests of our Texas friends, is our reason for establishing this new branch office. No other point in Southern Texas is better adapted to serve as a distributing point than San Antonio. It has four great railroads—the Southern Pacific R. R. east and West—the International and Great Northern R. R. from Laredo up through San Antonio and Central Texas, the San Antonio and Arkansas Pass R. R., and San Antonio and Gulf R. R. It also has the American, Wells-Fargo and Pacific Express Companies.

Our Managers. We have secured as managers Mr. Udo Toepperwein, formerly of Leon Springs, and Mr. A. Y. Walton, Jr., both of whom are well known to the bee-keepers of South and Central Texas. They are also thoroughly familiar with practical bee-keeping and all matters associated with it, and any orders sent to this branch will receive prompt, careful attention.

Our Goods. As usual our motto is to furnish the best goods of the most approved pattern. We do not undertake to compete in price with all manufacturers. Bee-keepers have learned that it does not pay to buy cheap supplies, for a saving of 10 cents on the first cost of a hive may be a loss of many times this amount by getting poorly made and ill-fitting material. Every year brings us many proofs that our policy of “the best goods” is a correct one.

Our Catalog. Very few changes in prices will be made in our new catalog, so do not delay your order, but send it at once. You will be allowed a refund if lower prices are made, and in case of higher prices ruling in the new catalog, if any, you will secure the benefit by ordering now. Catalog and estimates may be had by applying to the address given below.

Our Invitation. Whenever you visit San Antonio you are invited to call at our office and make it your headquarters. Here you will find a display of Apianary Supplies not equaled elsewhere in Texas. You will also find on file the leading bee-journals to pass pleasantly your leisure time.

Spanish Catalog. Some of you may read Spanish, or have a bee-keeping friend who does. If so, call for our Spanish catalog. It's sent free.

If more convenient, Dues may be sent to the office of the American Bee Journal, when they will be forwarded to Mr. Secor, who will mail individual receipts.

A Celluloid Queen-Button is a very pretty thing for a bee-keeper or honey-seller to wear on his coat-lapel. It often serves to introduce the subject of honey, and frequently leads to a sale.

NOTE.—One reader writes: "I have every reason to believe that it would be a very good idea for every bee-keeper to wear one [of the buttons] as it will cause people to ask questions about it, and a conversation thus started would wind up with the sale of more or less honey; at any rate it would give the bee-keeper a superior opportunity to enlighten many a person in regard to honey and bees."

The picture shown herewith is a reproduction of a motto queen-button that we are furnishing to bee-keepers. It has a pin on the underside to fasten it.

Price, by mail, 6 cents; two for 10 cents; or 6 for 25 cents. Send all orders to the office of the American Bee Journal.

No. 4 "Barler Ideal" Oil-Heater.

The "Barler Ideal" OIL-HEATER....

Saves Its Cost Every Year!
NO ODOR! NO SMOKE! NO ASHES!
Costs only a cent an hour to run it.

The editor of the American Bee Journal is using the "Barler Ideal" Oil-Heater, and it is all right in every way. We liked it so well that we wanted our readers to have it too, so we have recently arranged with its manufacturers to fill our orders. The picture shown herewith is the one we recommend for general use. It is a perfect gem of a stove for heating dining-rooms, bed-rooms, and bath-rooms. It hinges back in a substantial way, and is thoroughly well made throughout. The urn removes for heating water. The brass front, or well, has a bail, and holds nearly one gallon of kerosene oil. It is just as safe as an ordinary lamp. You wouldn't be without it for twice its cost, after once having one of these stoves. Most oil-stoves emit an offensive odor, but this one doesn't. Its height is 2½ feet, and weighs 20 pounds, or 30 pounds crated ready for shipment, either by freight or express.

Price, f.o.b. Chicago, \$6.00; or, combined with a year's subscription to the American Bee Journal—both for only \$6.50. FULL DIRECTIONS GO WITH EACH STOVE.

If you want something that is really serviceable, reliable, and thoroughly comfortable, you should get this "Barler Ideal" Oil-Heater, as it can easily be carried by any woman from one room to another, and thus have all the heat you want right where you want it.

Address,

GEORGE W. YORK & CO.,
Chicago, Ill.

Please Mention the Bee Journal when writing Advertisers....

The Novelty Pocket-Knife.

Your Name and Address on one side—Three Bees on the other side.

[THIS CUT IS THE FULL SIZE OF THE KNIFE.]

Your Name on the Knife.—When ordering, be sure to say just what name and address you wish put on the Knife.

The Novelty Knife is indeed a novelty. The novelty lies in the handle. It is made beautifully of indestructible celluloid, which is as transparent as glass. Underneath the celluloid, on one side of the handle is placed the name and residence of the subscriber, and on the other side pictures of a Queen, Drone, and Worker, as shown here.

The Material entering into this celebrated knife is of the very best quality; the blades are hand-forged out of the very finest English razor-steel, and we warrant every blade. The bolsters are made of German silver, and will never rust or corrode. The rivets are hardened German silver wire; the linings are plate brass; the back springs of Sheffield spring-steel, and the finish of the handle as described above. It will last a last-time, with proper usage.

Why Own the Novelty Knife? In case a good knife is lost, the chances are the owner will never recover it; but if the "Novelty" is lost, having name and address of owner, the finder will return it; otherwise to try to destroy the name and address, would destroy the knife. If traveling, and you meet with a serious accident, and are so fortunate as to have one of the "Novelties," your POCKET-KNIFE will serve as an identifier; and in case of death, your relatives will at once be notified of the accident.

How appropriate this knife is for a present! What more lasting memento could a mother give to a son, a wife to a husband, a sister to a brother, or a lady to a gentleman, the knife having the name of the recipient on one side?

The accompanying cut gives a faint idea, but cannot fully convey an exact representation of this beautiful knife, as the "Novelty" must be seen to be appreciated.

How to Get this Valuable Knife.—We send it postpaid for \$1.25, or give it as a Premium to one sending us THREE NEW SUBSCRIBERS to the Bee Journal (with \$3.00). We will club the Novelty Knife and the Bee Journal for one year, both for \$1.40.

GEORGE W. YORK & CO.

St., Chicago, Ill.

Please allow about two weeks for your knife order to be filled.

ESTABLISHED IN 1861 AMERICAN THE OLDEST BEE-PAPER IN AMERICA BEE JOURNAL

41st YEAR.

CHICAGO, ILL., NOVEMBER 21, 1901.

No. 47.

✱ Editorial. ✱

A Dr. Miller Number is what might be called this week's issue of the American Bee Journal. When we visited him recently we discovered the original photographs of the pictures shown, and decided to use them in a single number, as we now have done.

As we have described quite fully each illustration, no extended write up by us will be necessary. Still, if there is anything about the pictures our readers would like to know more of, they can easily send in their proper questions to Dr. Miller, when he will reply to them in these columns.

We wanted very much to show a picture of Mrs. Miller, but she said "No" in such a kind, yet decided, way that we felt we must respect her wish. She is a most lovely woman, greatly interested in all the Doctor's work and writings. Of course, you'll expect Dr. Miller to have just such a wife.

As our readers know, Dr. Miller is past his 70th birthday, and yet no one would suspect him of being nearly that age. He retains his youth in a wonderful manner. But that comes from the Spirit that dwells within, and that shines forth in his daily life. It keeps him young and happy. May it also keep him with us yet many years, to bless and to cheer all who are so fortunate as to meet him or read his helpful words.

The 3d International Congress is to be held Sept. 9, 10 and 11, 1902, at Bois-le-due, Holland, and the program is already published. Among other topics are: The role of bees in fertilizing grain and grape-vines; increase of bee-pasturage; causes of swarming; influence of food upon the brood; length of bees' tongues; foul brood legislation in different countries; adulteration of honey and wax; suppression of fumigation of bees sent from one country to another. The last topic is to be in the hands of our esteemed countryman, Mr. Dadant.

Sampling Honey in the best way is a matter of considerable importance. At fairs or other exhibitions it is important that nothing untidy shall be done, and it is by no means a pleasant thing to have a spoon passed from one person to another or dipped into honey after having been in the mouth. The matter is perhaps more strongly accentuated in the case of selling honey by samples, for a prospective customer, on being handed a

sample of honey in a spoon, has no means of knowing who the preceding taster has been, and in some cases he will plumpily say he wants no honey rather than to put in his mouth that which may previously have been in a mouth that was filthy or diseased. The best way to have no suggestion of uncleanness is to avoid the use of anything the second time—in other words, to throw away immediately whatever has been used once. A common wooden toothpick serves a fair purpose, and for sampling comb honey there may be nothing better, for with a toothpick there is no need to break open more than one cell. For extracted honey something a little broader than a toothpick would be better. Some have splints specially prepared, and it might be interesting to learn from those of experience what is the best and most convenient thing.

Spraying Fruit-Trees in Bloom.—An editorial in the Farmers' Review, after speaking of the harm to bees, says:

It has also been discovered that the poison is equally destructive to the life of the pollen, even when the amount of poison is only 9 to 10 parts in 10,000. Even two parts in 10,000 has been frequently found fatal to the pollen. The danger to the pollen is, however, greatly lessened by the fact that the blossoms do not all open at once, but the process extends over several days. In a clump of five apple-blossoms the central one opens first, and spraying at that time kills the pollen in only these open blossoms.

Crate, Rack, or Super.—Something of a controversy is now on in the British Bee Journal as to the proper term to use for the receptacles on the hives that hold sections. The supply catalogs and some of the correspondents have it "crate," while the journal insists it should be "rack." They might do worse than to compromise by using the word in almost universal use in this country—"super." Unfortunately, while there is unanimity in this country as to the written word, the spoken word is by no means always the same. It is just as much out of the way to say "sooper" in place of "super" as it would be to say "evor" in place of "cure."

Moving Bees. The distance bees can safely be moved that is, without danger of their returning to the old location unless special precautions are taken—is a matter that depends upon circumstances. It may be two feet, or it may be two miles, much depending upon the time of year. After bees stop flying in the fall, and up to the time when they begin to gather in the spring, they may be moved any number of inches or feet, and there will be little danger of any return-

ing to the old place, because each time they fly out they do more or less marking of the location.

At a time when they are gathering daily, if forage is so plenty that they do not fly as much as a mile from home—providing such a supposition is admissible—then a removal of a mile or more from home would not be likely to be followed by the return of bees to the old location. If they should be working upon basswood five miles away, then a removal of two, three, or five miles in the line of that flight might be followed by the return of a considerable number of bees to the old place, for after working on the trees with which they are already acquainted, it will be in accord with their former habit to make a bee-line for the old home.

Late Feeding of Sugar Syrup—as late as the present date, or at any time during the winter—should only be mentioned to be condemned. If, unfortunately, a colony is still short of stores, supply the deficiency either by means of combs of honey or of "Good" candy. If the work is carefully done, a hive may be opened and a comb of honey placed close up to the cluster of bees without seriously disturbing them. If you have no surplus combs of honey, take an empty frame and fill it with sections of honey, trimming off enough to make them fit in the frame, then hang the frame of sections in the hive. If the bees of the colony extend below the bottom-bars, combs or sections may be shoved under for their use, providing there is a sufficient space under the bottom-bars, as there is in many cases at the present day in winter.

Honey Jimcracks.—"The following is recommended in *Progres Apicole*," says *Gleanings in Bee-Culture*. "For want of a better name we will call them 'honey jimcracks.' They are doubtless good in both French and English."

Mix together one quart of honey, one quart of powdered sugar, one quart of fresh butter, and the juice of two oranges. Incorporate with this, slowly, a little fine wheat flour, and make a dough of it thick enough to be rolled out; knead it, and beat it for several minutes, and finally roll it out with a rolling-pin in layers about half an inch thick. Cut out round cakes, like biscuits, and bake them on a light plate, greased with butter, with moderate heat.

Do Bees Pierce Grapes? Mr. Gerlomi relates in the Austrian Bee Journal that being in a region where grapes are largely cultivated, his neighbors charged his bees with the destruction of grapes. He invited them to a test. Clusters of grapes of 28 varieties were

placed for the bees Sept. 25, but were left untouched the entire day. Next day the clusters of grapes were sprinkled with honey-water. They were vehemently attacked by the bees, the sweetened water licked up clean, yet not a berry injured. September 29 the clusters were changed, sprinkled with honey-water, and five berries in each cluster pierced with a needle. They were promptly licked off, the punctured berries emptied, and the rest left whole. The next day ten grapes were punctured in each cluster, and these alone cleaned out, except two or three berries that had probably been accidentally injured. Black Portuguese grapes were an exception; ripening early they burst open, especially in wet weather, and, of course, were then cleaned out by the bees.

A Good Word for the Blacks is spoken in the Rocky Mountain Bee Journal. A. E. Willcutt has blacks with a tongue-reach of 16-100 inch which gather more than his Italians with 19-100, and he thinks if blacks had had as fair a chance as Italians the blacks would be ahead.

Weekly Budget.

THAT TEXAS HORSEMENT paragraph, on page 706, was written by Mr. Louis Scholl, instead of Editor Root. The wrong credit is clearly an error on our part, as we have since noticed that it is plainly stated in the original article from which the paragraph was taken, that Mr. Scholl was requested to write about the horsement, after Mr. Root had departed from Texas. We are glad to make this correction.

MR. W. Z. HUTCHINSON, writing us Nov. 10, said:

FRIEND YORR.—When at Buffalo I promised Mr. H. G. Aekin that I would come up to their December convention at Minneapolis, Minn. I have just received notice that it will be held the 4th and 5th. This throws me out of attending the Chicago convention. I am sorry, as I had anticipated having an enjoyable time.

Yours truly,
W. Z. HUTCHINSON.

Well, that is too bad. But the meeting will be a good one, anyway. Of course, all would like to have Mr. Hutchinson present, but what will be our loss will be Minnesota's gain.

MR. W. J. CRAIG, the editor of the Canadian Bee Journal, and withal a very pleasant gentleman, was present at the Buffalo convention, and has this to say editorially:

As was previously announced, the exercises consisted principally of questions and answers. We were afraid at first that this kind of program would become monotonous and tiresome, but the interest continued right through, and very much valuable information was imparted. Mr. E. R. Root proved himself an ideal chairman, and perfect order and good humor prevailed during the sessions. Dr. A. B. Mason, the general secretary, has a happy faculty of making people feel at home. We Canadians were treated with the greatest possible courtesy and consideration; pleased to say we had a good representation.

The Buffalo Convention.

Report of the Proceedings of the Thirty-Second Annual Convention of the National Bee-Keepers' Association, held at Buffalo, New York, Sept. 10, 11 and 12, 1901.

(Continued from page 727.)

USING FOUNDATION FOR COMB HONEY.

"Is it desirable to use drawn foundation in securing comb honey?"

Mr. Wilcox—Some years ago I was called upon to conduct some experiments on the subject of the use of full sheets of foundation and small starters, and, from those experiments, I might say that the result showed that the more comb I gave them the quicker they were filled and finished, hence the drawn comb was the first filled and finished, the full sheets of foundation next, and the small starters last. This question probably relates to the practice of putting in a sheet of foundation to be drawn out half length or more, to be cut up and used in sections as starters for the bees. I am satisfied with that experiment and subsequent experience, that the bees produced more honey if supplied with combs fully drawn. At the same time, I do not think it practicable for the majority of bee-keepers to do it. The difficulty or trouble of getting them drawn out balances the gain, and I prefer to put in the starters and let the bees draw them out and then fill them.

Mr. Heise—I think probably Mr. Wilcox has the key to the question. I thought probably this referred to the artificially drawn combs. Probably it does not.

Mr. Betsinger—I hate awfully to let it stand in that form. My experience is that they will use foundation, do better work and fill the section quicker than they will with the foundation that has been drawn out previously, especially if it has been carried over one season.

FLAVOR OF RED CLOVER HONEY.

"Can any one here tell the flavor of red clover honey?"

J. F. Moore, of Ohio—We have had a good deal of red clover honey down in our section this summer. It is a thing we have never experienced before, and generally after the middle of July the bees seemed to settle back and think they have done all that is necessary, but this summer they have gathered considerable honey from red clover. It is very much like white clover. When you open a hive in which it has been gathered freshly it reminds you of white clover. It seemed to be very white and nice. The bees were at work on red clover and there wasn't anything else to gather. It is in Seneca County, Ohio. Some of the bees were pure Italian; most of them were hybrids. Hybrids are kept more easily than Italians in our section. There was white clover early in the season, but later there was very little of it.

Mr. McEvoy—Every kind of bee has

gathered honey this year from red clover.

Dr. Mason—I suppose there are a good many of those present who have robbed bumble-bees' nests, and if you have, and tasted the honey, you know just about how red clover honey tastes. It has a real, nice flavor.

Mr. Hershiser—Referring to the secretary's remark about bumble-bees gathering red clover honey, I would like to know if bumble-bees do not gather other honey than red clover honey.

Dr. Mason—I think the flavor of red clover predominates. I have tasted of it quite a good many times in different apiaries, and the parties have called my attention to it as having been gathered from red clover.

HONEY FERMENTING IN THE COMB.

"Will honey ferment in the comb?"

Mr. Wilcox—I know it will.

Mr. McEvoy—Yes.

Dr. Mason—That depends on where it is kept, I believe.

Mr. Wilcox—Whenever it is kept warm enough to absorb moisture, and once the moisture clings to the honey, and if it is continued warm and moist, it will ferment. If it is kept warm and dry it is all right. It must absorb the moisture first to ferment.

COMBS OF CANDIED HONEY.

"What is the best method of handling combs that contain candied honey, in the spring?"

Dr. Mason—Uncap it and give it to strong colonies.

Mr. Moore—I would advise uncapping it and pouring water on the comb where it is candied. Bees will use it up.

Dr. Mason—If the honey is moist you need not pour any water on it. If it is dry, pour on some water.

W. L. Coggsball—I would just pile those hives up with the candied combs outdoors where the bees could have access to them, and that honey you can take and put in a wax-extractor and liquefy it.

Dr. Mason—If it is moist, you would not need to do that way.

W. L. Coggsball—I wouldn't pour any water on the combs.

"WHAT IS A TESTED QUEEN?"

Mr. Wilcox—One you have tried and found to be good for nothing.

Mr. Heise—Is that the only way we can tell tested queens?

Dr. Mason—The other is when it has been tried and found to be good.

Mr. Benton—I think some one who has asked that question would like to know what a tested queen is. In popular parlance a tested queen is one that has been kept until we have seen

her worker-bees and know from their markings that they belong to the race they are supposed to belong to. A queen is partially tested as soon as you have seen her deposition of eggs, when you have observed that she has deposited eggs and laid them regularly; but in the popular parlance, it is a queen whose workers you have seen and which come up to the standard of the race she is supposed to belong to. You can carry a test somewhat farther and test her for her queen progeny, test her for their gathering qualities; but I think everybody understands the popular test.

Mr. McEvoy—I like a queen to lay her eggs so that when they come to cap the cells they will all be capped in one day. I do not like an irregular layer.

Mr. Benton—I want the brood to be in solid. It develops better because of its mutual heat. The developing insect develops a great deal of heat, and we can test a queen from the appearance of her eggs.

Mr. Moore—I have an idea that the man who asked that last question would like to know if he has an Italian queen. How would you know the progeny? What is the marking of an Italian bee?

Mr. Benton—The first and prime point is three yellow bands on the anterior part of the abdomen, that is, directly under the wings or near the thorax of the insect. Not necessarily light, because there are dark and light Italians, and I should say that the queen that gave workers showing those three yellow bands and the general large form of the Italian, with a brownish tint over the body that is due to the fuzz on the body, would come up to the standard of an Italian queen, and the more even that marking is the better it would be in that particular respect. An evenness in the points, every worker like every other.

A Member—I would like to ask Mr. Benton if he would deem a bee an Italian that showed four bands?

Mr. Benton—I would say that was a queen that had been produced by selection, but I would not require that the workers had four bands in order to come up to the Italian standard.

A Member—Suppose most of the bees had four bands, but once in a while you saw one with only three, would that be against her?

Mr. Benton—Decidedly. I would not call that a pure Italian bee.

Mr. Wilcox—I agree with Mr. Benton, that uniformity of markings is the most important point.

MISCELLANEOUS MATTERS.

The secretary then read a letter inviting the members of the National Bee-Keepers' Association to the annual meeting of the Ontario Bee-Keepers' Association, to be held at Woodstock, Ont., in December.

Mr. Heise warmly discussed the invitation to the members.

Mr. York—I would move that we as an association accept the invitation so courteously tendered by our friends from across the border, and as many as possible attend their meeting.

The motion was seconded by Dr. Mason and carried.

Mr. York—It seems to me it would be well to have a committee on resolu-

tions to report at the close of the session.

On motion, Messrs. Abbott, C. C. Miller and N. D. West were appointed.

Mr. Benton—I move that the convention adjourn tomorrow at 1 o'clock and meet at the Epworth Hotel in the evening.

The motion was seconded.

Dr. Mason—I move as a substitute that those who wish to go to the Pan-American can do so, and the others remain here.

After a brief discussion the substitute was carried.

Mr. York—I move that the matter of selecting a badge be referred to the Board of Directors.

The motion was seconded by Dr. Mason, and carried.

Mr. York—On the matter of score card, I would move that the same committee that acted last year be re-appointed to act this year. I think Mr. N. E. France, of Wisconsin, was chairman of that committee. Mr. Hutchinson was also a member, and Mr. Hershisier.

The motion was seconded.

Dr. Mason—If I remember correctly, the score card committee last year made a recommendation and it was adopted by the Association.

Mr. York—They reported after the close of the convention, by mail, and that report was printed with the rest of the proceedings. With the consent of the seconder, I will withdraw my motion.

Mr. Hershisier—I move that a new committee be appointed to revise the work of the old committee.

Mr. York—I move that this convention select a committee of five to report on the score card before we adjourn, as recommended last year.

The motion was seconded by Dr. Mason, and carried.

Mr. York—I nominate Mr. Benton.

Mr. Wilcox—I nominate F. Greiner.

A Member—I nominate Mr. Miller, of Canada.

The score card is a card recommended to be used by judges at honey exhibits.

Mr. Hershisier—I nominate Mr. Hutchinson.

Mr. Heim—I nominate Mr. Hershisier.

Mr. Benton—I would prefer to withdraw in favor of somebody else.

A Member—Then I would nominate W. F. Marks, of New York.

The motion was put and carried.

It was moved, seconded and carried that the roll of those present be called by States. The result was as follows: Massachusetts 2; New York 42; Pennsylvania 8; New Jersey 3; West Virginia 2; Cuba 1; Texas 2; Missouri 2; Iowa 1; Minnesota 3; Wisconsin 1; Illinois 4; Indiana 1; Michigan 4; Ohio 8; Canada 18; Maryland 1; Connecticut 1; New Hampshire 1; Jamaica 1.

QUESTION ON QUEEN-REARING.

"How many days after the egg hatches in a queen-cell does the queen cease to live on the royal jelly, and what does she then live on?"

Mr. Benton—It varies from 5½ to 6 days; in other words, she lives on this royal jelly or larval food during her whole larval period; the cell is then sealed over, and she then lives on the fatty tissues derived from the food she ate in the larval condition. The tip of the abdomen, or nymph, is inserted in

the food which remains there. I express the opinion that by absorption she does take from this food something in addition, but for the greater part I should suppose that she lives from the food deposits or tissue derived from the food she had eaten while in the larval period. The pupae of many insects remain over winter large numbers and some insects remain two or three years in this condition before they come out, and then we have the 17-year locust that remains 17 years in this condition, living on the absorbed tissue.

Mr. Betsinger—A similar question was discussed within the last two years, and I asked the question how the queen took this food, and of course the answer was given similar to what Mr. Benton gave; but I see he has added that she takes the balance of the food through the abdomen.

Mr. Sleeper—I think I have seen indications that this substance called royal jelly is largely absorbed by the posterior portion of the abdomen during this time after the larva is sealed.

Mr. Benton—It might be well for me to say that I expressed an opinion merely; I have a little basis for that opinion. I have noticed that if cells are shaken at a certain period, this juncture of the pupa in the queen-cell is broken, and she drops to the bottom; of the cell and may never emerge after that—it depends upon the state of development if she emerges; and if she emerges, she may be somewhat inferior through having dropped down. My inference was that she was deprived of the final part of the nourishment.

Dr. Mason—I think I have seen cases of that kind where the queen was detached in that way in an early period of the development. It injured the queen very materially.

Mr. Benton—The idea would then be not to handle queens roughly, or to move them as little as possible until the perfect queen has emerged.

MEMBERSHIP QUERY.

"If I fail to renew my membership and renew it afterwards, when does the renewal date from?"

Dr. Mason—The renewal dates from the time you renew. If you are a member of the Association and you fail to renew that membership by the time the year expires, you cease to be a member; so, those of you who are members, don't entertain the idea that you can have the protection of the Association and pay at the end of the calendar year.

DOES COMB COLOR AFFECT COLOR OF EXTRACTED HONEY?

"Does the color of comb make any difference in the color of extracted honey?"

Mr. McEvoy—Take old combs and sprinkle them well with water, shake them, and see if you don't get something a little the color of tea. Take a white comb, shake it and see what you get from that. Now, after a comb has been used several times and extracted, the bees have cleaned it out so much that you cannot see much difference.

Mr. Betsinger—I made it a business to attend a good many fairs and I have seen some pretty fine honey; I have made a great point to find out where it came from, and I believe there is an exhibition today in our State, and the

extracted honey was taken from old combs. There was also honey there taken from new combs. It has not taken the first premium because of its lack of color. Now, I will admit that you can wash old combs and get color from them, but it is not honey. Honey doesn't take on color. You can lay it down in the dirt and it will still be white.

Mr. Wilcox—I would like to ask you if your first extracting is not a little darker in color than the next honey-flower.

Mr. Betsinger—I would say, no, sir. The honey taken the second time is no whiter than the first, but the season in this State is not long enough to get honey from any one blossom; you would have to extract every day to get the same quality; our flowers vary from day to day.

Mr. McEvoy—I have been 18 years an inspector in the Province of Ontario, and I think very few men have more thoroughly tested the quality of old and new combs, and my experience has been that the old combs do give it a shade of color. You will get, perhaps, a little better color of honey from one colony than another.

Mr. Betsinger—Do you mean to say that one colony gets whiter honey than the other from the same field?

Mr. McEvoy—I would not say the same field.

Mr. Davidson—I would like to add my experience to that of Mr. McEvoy. I have been in the extracted-honey business a good deal, and while I do not know that honey will take on color, I do know that honey taken at the same time stored in light and dark combs will have different colors. I have tested it in our extracting in Texas. The bees store the honey in the brood-combs sometimes, and I have to separate those combs and keep them separate from my regular extracting-combs in order to keep from coloring the whole lot of honey. I know it is gathered at the same time and by the same colony.

"Jamaica"—My opinion is that the comb has a lot to do with the color of the honey, because down our way all our honey is pure white. I have known the same honey to be stored in dark or old combs and it brings out a dark honey with a very inferior flavor.

A Member—It occurs to me that perhaps there may be a double meaning. Mr. Betsinger may refer to old combs that have been used a number of years for extracting, and some one else may refer to combs that have been used in the brood-chamber recently and then put into the hive and honey extracted from them. In that case my experience would be that the honey is somewhat colored.

W. L. Cogshall—Mr. Davidson, in talking of that matter, said he got more or less bee-bread in the honey, which made it a little bit colored. Mine is almost all buckwheat honey, and, of course, you couldn't see much difference there. I think there is hardly enough difference to make it worth while to bother with.

Dr. Mason—This is an important matter. Some of you produce dark honey only, and that is all, and your opinion isn't worth much. It is only a few years since, that I advocated this matter that it did color, and I was laughed at; and no longer ago than

two years, in the Philadelphia convention, when I spoke of this. President Whitcomb said, "Do you believe that honey dissolves the wax?" Mrs. Harrison recently said something on this subject in one of the bee-papers. "When you want nice, light honey get nice, new combs." Now, I have had a good deal of experience in this line, and this year I have been more thoroughly convinced of it than ever. I have combs that had been used as brood-combs for years, and that had not been used as brood-combs for several years past, and I put them in supers with combs that were never used for brood-rearing; I uncapped the old and the new and extracted, the old combs in one extractor and the new ones in another extractor—and the color was so different that you wouldn't believe it was the same honey. Now, I am so thoroughly convinced of this that, although I have about six full extracting combs to the colony, I am going to destroy every one of them and put new ones in place of them, so that I can have honey not colored by old combs.

Mr. Betsinger—I may be behind the times, but I am not behind in long years of experience. I have extracted, of course, more or less honey from old and new combs, and I would not give a snap of my finger for the difference between old and new combs.

Mr. McEvoy—I don't wish to be understood as saying that using old combs is going to give you a dark-colored honey. I would use it several times before I would think it sufficiently washed out.

Mr. Terrell—I wish to endorse what Mr. McEvoy has said. The question is whether it refers to old combs that have been used for years for extracted honey. This season I have taken combs from old colonies, placed them on top for extracting purposes, and the first honey extracted was decidedly colored, but as I kept on taking off the honey, the last extracting there was not very much difference between the honey from the old combs and the new ones.

Mr. Benton—When the honey is first gathered it is about three-quarters water. Now, if pure water would take on the coloring, why wouldn't three-quarters water and one-quarter sugar?

W. L. Cogshall—In sending some bees down to Cuba I sent along some combs, and I left from 10 to 12 pounds of honey in each colony, and it took them that whole season down there to get that dark honey out of the colonies. The bees kept carrying it up, and it took but a very little dark honey to color the white honey.

F. J. Miller—If there is any person who is doubtful about this, if he will pour water into a comb and allow that water to stand half an hour and then pour it out, he will see a decided black color; and if he refills that comb the color will gradually grow lighter. I have invariably found that I could not make an exhibition article of honey from those brood-combs. Commercially speaking, it would not matter, probably, but if you were doing it for exhibition purposes it would make a decided score against you.

Mr. Wilcox—All the arguments go to show that the first extracting is darker colored than the second, but they don't show why, because that color comes from the comb itself, or the accumula-

tion of dust and dirt that may be in that comb during the winter season. I have supposed that it was an accumulation of smoke or dirt which might have gotten into the combs during the winter. I don't know yet whether that coloring is in the comb itself. I shall be slow to destroy my old black combs. I shall keep them and extract from them.

Mr. Betsinger—The gentlemen mention their first extracting as being a little colored. Honey isn't water; it is an oil. You can not make a wash with honey.

Mr. McEvoy—Allow me to explain a little. A member speaks about the first extracting of honey. Now, with me I work so as to have no honey extracted except clover, and the clover from the white combs is a shade whiter on the start than it is from the old combs.

Mr. Betsinger—If you were in a locality where you didn't have one drop of honey in the brood-chamber—none at all to come up into the surplus chamber—then I must say you are a happy man to extract honey.

Mr. McEvoy—I uncapped between fruit, plum and clover, and I convert the honey into brood feed. Mr. Heise knows the system I follow, and Mr. Miller knows it. I think that I can prove my case.

Mr. Betsinger—Does any mustard grow in that locality?

Mr. McEvoy—I dare say you could find some, but I myself don't know where it is.

N. L. Stevens, of New York—Is the honey stored in those dark combs affected any in flavor by storing in them?

Dr. Mason—No, sir; it takes a fine taste to tell it. No man who chews tobacco can tell the difference.

SMOKING BEES WITH TOBACCO.

"Is it detrimental to the bees to use tobacco-smoke whenever necessary to open hives?"

Mr. McEvoy—I don't think it is necessary ever to use tobacco-smoke.

Mr. Benton—I would say, decidedly, never use tobacco-smoke on them.

Dr. Mason—I have a strain of bees with which I don't think of using smoke or veil. I take out the combs and shake the bees off without ever getting a sting.

Mr. Benton—I think there are times when some have claimed that tobacco-smoke was useful in introducing queens, but I should think that being strong-scented and producing a strong odor in the hive would probably conduce to the receiving of a queen, and I do not think it is permanently detrimental to use tobacco-smoke on queens.

Mr. Moore—Does tobacco-smoke have a more detrimental effect in conquering very cross bees than just ordinary smoke?

Mr. Benton—I think if used on the ordinary cross Italian bee it is a good thing, but not on Cyprians.

Dr. Mason—I have sometimes tried it in introducing queens, and it has seemed to be a help.

Mr. Hershiser—I tried uniting colonies of bees, or nuclei, to make the colonies strong enough to winter, some years ago, and gave them so much that it made them sick, so that they dropped down to the bottom of the hive; but after they "came to" again they

proceeded to fight it out in the ordinary way.

Mr. Davidson—I have introduced hundreds of queens by using tobacco-smoke, and very successfully, but I would like to add a word of caution—it ought not to be done at any other time than late at night. The way I use it for introducing is right at night; just give them a few puffs of tobacco-smoke and put in your queen—enough to make them so they all feel the effects of the smoke. It is the most successful way I have tried in ten years of introducing queens; but it requires caution to keep down robbing. I use common smoking tobacco, and smoke them till I know they all feel the effect of it.

You can tell by the noise they make running around. I used to use it in the middle of the day, but when smoked in the middle of the day a few strange bees are apt to come in.

ELECTION OF OFFICERS.

The matter of election of officers for the ensuing year was then taken up and the following nominations made: For President, W. Z. Hutchinson was nominated by Dr. Mason.

Mr. Abbott moved that the rule be suspended, and the secretary be authorized to cast the unanimous ballot of the Association for W. Z. Hutchinson as president for the ensuing year. The motion was seconded and carried, the

secretary cast the ballot, and Mr. Hutchinson was declared duly elected.

For vice-president, O. L. Hershiser was nominated by Mr. Benton. Mr. Hershiser's nomination was seconded, and on motion of Mr. Abbott the rules were suspended and the secretary instructed to cast the ballot for Mr. O. L. Hershiser, who was then declared elected vice-president for the ensuing year.

Dr. A. B. Mason was nominated as secretary, and duly elected in the same manner.

The convention then adjourned till 7:30 p.m.

(Continued next week.)

Contributed Articles.

Queen-Breeding and Improvement in Bees.

BY A. NORTON.

IT is a matter for rejoicing that so much attention is now being given to the improvement of stock in the apary. In one sense the movement is not new. For years individuals have worked along this line and have done what they could independently, some in one direction and some in another. Even yet the movement has not become systematic; but it has grown so much in magnitude and is attracting so many of our most systematic apiarists and queen-breeders that we may expect to see it assume more and more systematic shape each season, if results do not prove too temporary to warrant its continuance. At least the united efforts of breeders will demonstrate how much dependence may be placed upon this hope of improving our races of bees, so that more intelligent estimates can be formed in the near future than at present. Even yet there is room for betterment in the aims of our improvers, some of whom decried what others are bringing about, and narrow their desires down to certain points, to the exclusion of other desirable ones. But we may hope that broader and so more uniform aims will soon prevail, and that then all breeders will be pursuing the same parallel paths.

Through but few pages of earth's record can we trace back bees and breeding. Geologically we know bees of sundry species as early as the Eocene age of the Cenozoic (or Mammalian) time. The oldest known specimens are found preserved in the Eocene amber, or fossilized wax, on the shores of the Baltic Sea. That was about the time of the first appearance of flowering plants and trees, and before there was any one to domesticate and breed them. There were none even to love the sweetness of their garnerings till the cave bear came, unless animals of some other then existing orders were fond of honey.

How long honey-bees have been the associates of man as domesticated insects can not be even conjectured. Historically, the searches into this question that we have seen from time to time in the American Bee Journal have carried us well into antiquity, but have not brought us to any answer. They have shown, however, that anything like intelligent handling and careful breeding is by no means ancient, and that our present improvements have been accomplished within a short period. While we should avoid over-conservativeness, or "old fogyness," in regard to progress, we may, on the other hand, get into over-enthusiasm in our visionary hopes.

In considering the subject of breeding bees, and the possibilities that lie therein, men are liable to let preconceived ideas carry their hopes, if not beyond the possible, at least beyond the probable. Yet any who may have excessive expectations of what breeding may bring forth, are likely more wrong in their premises than in their conclusions. If the theories we are just now told we must believe or be behind the times, are true, that life evolved from dead matter and man originated in some monkey, and so on back in formless protoplasm, why need we limit our ambition in the line of breeding? Let us produce *Apis dorsata*, or something just as good, from the bees we already have, instead of searching Asiatic jungles for them. Let us breed bees from wasps, or,

perchance, develop mosquitoes into storers of nectar instead of robbers for blood.

Domestication hastens variation and increases it; but the balance of variation and heredity will always continue stable. Natural selection, therefore, may be considered as God's preventive of degeneracy, and not a substitute for creation; and, as surely as God circumscribed the ocean, He has also set the bounds of propagating organisms—"So far shalt thou change, and no further." Logic may lead us astray in these matters. If we reach the North Pole and keep on traveling, we will be getting away from it. So it is with truth, which is the only science; for logic, assumption, and speculation are not science.

Take, for instance, the familiar illustration of the deer and the wolves. The fastest deer can save their lives and breed faster offspring; and thus their speed has been attained, say logic, assumption and speculation. This necessitates the assumption that they once were slow. Do we know this to be a fact? How did they become slow if not by a process of evolution from some other condition? But, dismissing this little difficulty, we give assumption, speculation and logic full play, and conceive that once the wolves were so slow they could not catch the deer; and the deer were so slow they could not get away from the wolves. But the stern necessity for catching deer, and the pressing need of eluding wolves, have tended to make the wolves so fleet that they can overtake the deer, and the deer so swift that they can keep ahead of the wolves.

DR. MILLER ILLUSTRATING TO A VISITING FRIEND THE CROCK-AND-PLATE FEEDER IDEA (USING TUMBLER AND SUCKER.)

By like reasoning from assumption, we can prove that bees once had tongues too short to get the nectar from corolla-tubes; so how did they live, unless the corolla-tubes were too short to withhold their nectar? Then the flowers so lengthened their tubes as to bar bees from getting their nectar and cross-fertilizing them; and the bees' tongues so lengthened that they could get the nectar and fertilize the flowers. Of

DR. MILLER'S FARM-WAGON LOADED WITH BEES FROM THE OUT-APIARY.

course this was all since the time when flowers had no nectar at all, and bees had no use for honey, but made their living in some entirely different way. However, we must sadly admit that no assumption and logic based on natural selection can satisfactorily explain the uniformity of color in worker-bees, especially when we consider how variable in this respect are both queens and drones—the progenitors; and how shockingly they disregard all color-lines in mating; also, how little they could tell (if they wanted to know) what complexions their children would have, from the looks of each other.

But coming more directly to the subject of breeding bees, we really face the fact—which in proportion as it is known constitutes so much true science—that by careful selection we may induce changes in our bees in various directions until we reach the limit which the Creator has established; but beyond that we can go no further. The evolution of the yacht has shown continual increase of speed for many years. But the fact that this year's "Constitution" couldn't out sail last year's "Columbia" awakens us to the realization of what we should have already known, that the speed of sailing-vessels can not increase forever. A swifter yacht than "Columbia" might yet be built; but some vessel must some time be built than which none can be made any swifter. And so with bees, or poultry, or anything else domesticated. But we should strive to improve as far as improvement can be made. If we take care of the improvements, the limits will take care of themselves.

The writer does not assume to tell eminent and successful quack-specialists what they should do to better their strains; he will be content if he brings out any established truth that they may have overlooked, or the "laity" have forgotten. It is a mistake to assume that development can be carried on in only one direction at a time. Our Italian bees may be made (and they have been made) better in more respects than one. To take any one example among domestic animals: the Hon-dan fowl was in some period bred into one having a large, shapely crest and muff, a peculiar comb, regular characteristics of color, good size, great prolificness in egg-laying, and small amount of offal, and with the sitting instinct about entirely bred out. And with all this the fowl is hardy and strong. Now all these make a great many features to work for in the same breed, but the result was surely achieved. And we can find the same to be true of too many varieties of fowls, cattle, etc., to be mentioned. Hence we may conclude that we need not look to long tongues alone in breeding bees. We can carry on simultaneous improvements in hardness, length of life, length of tongue, gentleness, beauty, and other points, until we reach the bounds of each. Do not, therefore, derry any one of these because it is not what you have been developing heretofore; and do not be in such great haste to develop one that you forget to keep up the others. It is true that inability to control queen-mating is a great handicap; but enough has already been done to show that progress can be made despite this obstacle; and, besides, those who make so much of natural selection must admit that it has less control of mating of queens and drones than man can exercise.

The idea is often advanced that crossing would be a means of improving varieties. This does not seem in keeping with all the facts. If crossing carries the better points of parents into the offspring, it carries the poorer ones as well. In crossing you cannot say what shall or shall not be perpetuated. From its very nature crossing does not carry characteristics bodily from either parent so much as it divides or averages those of both. If each had one good point carried to excess, the cross might make a better average; but its greater

variability, resulting in more types to select from, would be offset by the greater difficulty of making the mongrels uniform and stable. Hence, there is more hope in selecting from the best among established varieties, because each step is more easily kept.

And, finally, it should be urged upon the masses of apiarists to patronize the regular queen-breeder. Especially does this apply to those who live in districts rich in honey and filled with bee-keepers. You are far more at the case in any other kind and under the power of wild bees than is the case in any other kind of stock-raising. The majority of your neighbors will not try to improve. No matter what you may try to do in the way of bettering your stock, you must lose it through the swarms of drones from inferior stock produced around you. You must, more or less often, have recourse to the permanent improvements made by breeders who have succeeded in getting places where their own drones mate with their queens. You thus help yourselves, and at the same time help the breeders to maintain the business which you would be sure to miss should it fall through lack of patronage.

Monterey Co., Calif.

Quoting the Honey Market—Other Matters.

BY FRANCISCO BROWN.

I WISH to add my approval to that portion of Mr. Cooley's criticism, on page 563, in reference to the commission-houses quoting fully up-to-date. I am particularly interested in the market quotations, but I wish them up-to-date. There is a feature in one of the bee-papers, if no more, of which I distinctly disapprove, in reference to said quotations, and that is, a house, quoting regularly, depreciating the bee-keepers' interests by cry of "overstock," or words to that effect, and creating the impression that the price is going down, and then saying, "We are not a commission firm." This kind of quotation is simply advertising their own honey. I wonder if the publishers of that paper would give all the rest of us a standing "ad" by telling them honey was worth so and so. I'll warrant the honey-dealer referred to does not tell his customers that honey is "down," "big crop," etc. I have dealt with commission-houses in honey for 15 years. Some, like the Horrie-Wheaton concerns, have treated me scandalously, and others have treated me remarkably fair. Under the present conditions of business we cannot well get along without the honest commission men. In some instances the producers are the gainers by consigning their product—not selling outright. How? Why, if we have a fancy, gilt-edged article, it brings the top price when buyers bid against each other. When we wish to sell outright, maybe only one or two buyers come along. For my part, I want the commission man, and I want him to know that I am alive—to my business; that the house that gets me the best price is the one that handles my honey. I have been converted to this decision more than once. To illustrate:

I once had a crop of extracted honey that I wanted to sell outright. I offered it at 8 cents, and would have taken 7. After sending him a sample, a commission man wrote: "Send me your honey—I will sell to best advantage, and you will be the gainer." I sent it. He put it into small glasses, and sold it at 16 cents, netting me 12 cents a pound. In the course of time this man sold nearly 50,000 pounds for me, selling my

TWO COMBS IN DR. MILLER FRAMES.

One frame dripping with bees, and both so filled with sealed-brood there is no room in them for honey.

SAMPLE OF DR. MILLER'S "PAT MURPHYS."

Half-bushel '16 Carmen No. 3, weigh 2½ lbs.; 3 largest weighed 6 lb. and ½ oz. The stick lying on them is a foot rule. Photographed Oct. 11, 1898.

comb honey for 16, 17 and 18 cents, when the best cash offer I received was 11 and 12 cents.

THOSE "HINTS ON HIRED HELP."

Tell Mr. Hyde (page 564, "Hints on Hired Help in the Apiary") to be thankful indeed that his ideal helper is not to be found. If conditions would regulate hired help to do all we want to exact of them, Mr. Hyde and a lot of the rest of us would be hired help. It provokes me as much as anyone to see hired help do things awkwardly, carelessly, or without thought or judgment, that a little reasoning would obviate. And yet these very things are necessary, or there would be no hired help—all would be owners—for it doesn't cost much to start with bees. Its details, especially, are our capital. So do not expect hired help to furnish the capital, and give you the lion's share of the earnings. A banker once asked for a cashier. Said his friend: "I can send you an honest young man, who knows nothing of banking." "That is the man I want," exclaimed the banker, "for I can teach him my methods and system, and he will not have to unlearn knowledge that I do not want in my business." Much so with hired help, especially in the apiary. Either make a partner of the man at once, or hold yourself in reserve, and let him realize he is only a part of the machine.

LOSS OF BEES BY COMBS MELTING DOWN.

In regard to Mr. Gerelds' loss of bees by melting down (page 566), the lack of water I do not believe had anything to do with the bees. All the colonies probably melted down within the space of an hour; when the breeze lulled had they been out in a 10-acre field the loss would not have been 10 percent, if that. We have long, hot summers in Florida, often getting up to 95 and 100 degrees, and last year, in August, it was 105 and 106 degrees on two different days, still I did not lose a single colony from melting down, and in several apiaries that I am acquainted with there was no loss whatever in this line. If Mr. Gerelds will raise his colonies on benches, and will put the two rows of hives about eight feet apart, then put a roof over them, extending it well over the sides, he will have a comfortable place for his bees, and also a comfortable one to work in.

In Florida a large ant is very troublesome to bees, often destroying a good colony in a single night. If there are any to contend with, hang the benches with wire from above, instead of having legs, or attach to the posts of the shed; then daub coal-tar on the wires, and the ants will be rid of.

The most serious charge against shed-aparies—and I have four in use, some of them several years—is the failure to get queens mated in colonies so kept. But to offset this, there is the satisfaction of having everything under cover, out of the rain, and the ease of manipulation when all colonies are close together. You can have all under lock and key by using 6-inch fence-boards on the sides, leaving a space of eight inches or a foot opposite the hive-entrances, and then stretch a strand or two of barbed wire along this. For 10-frame hives allow 20 inches space each in length of building. At one end have your work-room, made bee-tight by use of burlap or mosquito netting. Use old corn and oats sacks ripped up in which have a table and your extracting outfit. I mention the use of burlap instead of wire-cloth on account of the latter rusting out quickly in our moist climate. Florida, Sept. 7.

* The Afterthought. *

The "Old Reliable" seen through New and Unreliable Glasses.
By E. E. HASTY, Sta. B Rural, Toledo, O.

SPECIAL FACILITIES FOR MOVING BEES.

It seems that the Atchleys are so inclined to the perambulatory, pick-up-and-start kind of bee-keeping that they have 200 special hive-shells or cases into which bees and combs are put for moving, and taken out on arrival. As special wagons also are provided I infer that the cases are made of light materials—so light, and so much wire screen that they might crush on the road if the wagon body did not embrace each one and furnish the strength. How about this? Is it a winning idea; or is it too much expense? It stops, once for all, the smothering of bees—also the crushing of bees, so far as that comes from combs getting loose and thrashing around; but it can hardly stop new, weak combs from breaking out of the frames. Wonder if the imprisonment of each colony is supplemented by an outside screen over the whole concern. That would reduce to a very decided minimum the stinging of horses. I suppose one idea is that bees which do not get killed enroute, many of them have their lives shortened by what they suffer. If that's the case it may pay to spend some time and money to have the honey-gatherers arrive at honey Canaan in perfect order. Still my fancy hears some brother saying, "Too many traps and calamities;" and, "If I had such an outfit I shouldn't actually get to use it, on account of the time and fuss it calls for." Page 630.

STACHELHAUSEN AND LARGE BROOD-CHAMBERS.

Stachelhausen seems to favor decidedly the large brood-chamber. He strikes an idea pertaining to the matter which is not familiar to all of us. Let the queen lay all she can for a spell early in the season and she wants a partial rest when the main harvest is on. On the other hand, let the queen be obliged to restrict her laying to a mere fraction of what she is capable of, and her time to avenge herself will probably come eventually; and very likely it will come just when moderate laying should mean more surplus honey. It occurs to me that the very worst cases of this could happen in a very big hive with large frames, if the colony itself came through very weak in the spring. Page 630.

LEGISLATION FAVORING FRAME HIVES.

Aha! Ye legally appointed inspector, inspect he never so wisely, cannot inspect to any purpose the apiary where all the combs are built eriss-cross. That is, he can't when foul brood is nicely beginning in 20 colonies, and none have yet got putrid or weak. To meet this case, our legislative man, Hambaugh, wants everybody compelled by law to have bees on actually movable frames. Sounds seductive. But if we begin with that kind of legislation where will the end be? Where, indeed, till every dog is law-bidden to wag tail. "Down, left, right, up," as the singing-master would have him? And what shall we answer if some one at the state-

HOME FROM THE OUT APIARY.

Dr. Miller and Miss Wilson in bee-wagon used for going to and from out-aparies, hauling home honey, etc.; drawn by "Beauty" and "Dandy."

house inquires, "Is it advisable to pass eleven laws for ten men?" Page 631.

PACKAGES FOR RETAILING EXTRACTED HONEY.

It is not so much by shouting our conclusions at one another that we shall conjure up the ultimate truth from the bottom of the well, as it is by candidly laying our real experiences side and side. Mr. Davenport finds his customers don't return packages worth a cent. I find mine, pretty much all of them, so carefully conscientious in the matter that keeping a memorandum book, to show where the out pails are, seems rather a waste of time. Are my customers so much higher in their moral level than his? Improbable. What then? The full answer to that question is not likely to be reached except by a good deal of grubbing—perchance by a good many grubbers. I'll only just begin a little at one corner of the subject. Folks of low-average honesty, if they *think* (rightly or wrongly) that they have paid too much for the contents of a package, will gobble the package itself—as reprisal in part. I have several times tried to sell in the city by means of an intermediary, to fix his own prices, and the result is a heavy loss of pails. Page 631.

THE LEAKY HONEY-BARREL.

Davenport's experience with barrels should be noted. All leaked; both soft wood and hard wood, although dried for two years. Wax and warrant both failed. The wax cracked; and as for the warrant, honey doesn't seem to understand the meaning of a warrant at all. Page 631.

Questions and Answers.

CONDUCTED BY

DR. C. C. MILLER, Marengo, Ill.

(The Questions may be mailed to the Bee Journal office, or to Dr. Miller direct, when he will answer them here. Please do not ask the Doctor to send answers by mail.—EDITOR.)

Packing Bees for Winter—Other Questions.

1. I purchased 40 colonies of black bees, 20 in Falcon chaff hives and the rest in box-hives. The entrances of the chaff hives are only $\frac{3}{8}$ by 12 inches. Do you think that large enough for winter and summer?

2. Would you advise me to take the inner cover off of the brood-chamber and put burlap over the frames, and pack with forest leaves?

3. Would it be all right to raise the brood-chamber say $\frac{1}{2}$ inch in the summer, or would it cause the bees to loaf between the bottom-board and brood-chamber?

4. The frames have never been manipulated in these hives, and are badly braced and burr-combed. Would you advise transferring the bees and using full sheets of foundation?

5. The hives are painted red. Do you think it advisable to paint them white?

6. Would it be well to leave the packing around the brood-chamber all summer?

7. Is there any danger of using too much bi-sulphide of

DR. MILLER "TOUCHING OFF" COPY FOR THE BEE PAPERS.

carbon in fumigating the honey? Does it taint the honey? About how much should one use to fumigate 100 pounds? Does it matter in regard to quality?

8. I wish to prevent increase. What method would you recommend? NEW YORK.

ANSWERS.—1. For out-door wintering such an entrance is large enough. For hot weather, and for wintering in the cellar, I should prefer it much larger.

2. That's a good plan.

3. It would be all right.

4. If combs are straight and there is no trouble except the brace and burr combs, it would be a waste to transfer. Just cut away all the superfluous burrs and braces.

5. White is generally preferred, but if hives are in the shade it makes little difference.

6. Most bee-keepers prefer to remove the packing for summer.

7. An excess is not likely to do any harm, as it evaporates rapidly. Two tablespoonfuls would be enough, or more than enough, for 100 lb. of honey if placed *over* the honey and closed up tight. I think you need pay little attention to quality. See interesting discussion in the report of the Buffalo convention, page 502.

8. I hardly know; there are so many ways. One way is to double up in the fall to nearly the number you want, and, if none of them die in winter, to do some more doubling-up in spring. Another way is to remove the old queen when a prime swarm issues (if your queens are clipped they will be destroyed if you let them entirely alone), and then as soon as the first of the young queens issues—which you may know by hearing the young queen pipe in the evening—destroy all remaining cells, or return the swarm as often as it issues with the young queen.

* The Home Circle. *

Conducted by Prof. A. J. Cook, Claremont, Calif.

OUR COUNTRY.

If there is any one thing that should make our hearts well up in gratitude more than any other thing, it is the thought of our incomparable country. True, the home comes nearest to us, and touches our hearts and lives with the best gifts. But our American homes could not exist outside of America. Britain is the only other country that comes within telephone call of us in matter of homey homes. And Britania pales, as poverty crowds comfort, health, and even life, from so many of Britain's households. Think! any boy—the poorest—can safely aspire to his own beautiful home in this grand American country. Industry and economy are sure to win thrift; and the American who does not reach competency, and a cosy, comfortable home, hardly deserves either.

I believe the best gift or possession that any boy or girl may fall heir to, is a good education. It can not be too broad or liberal. Even the day-laborer would be vastly better off with a good education. Were I to train a boy for the farm, I would have him pursue a course as thorough as that coveted by the would-be lawyer or physician. I would urge that he get all he could in the college; that he go then to the university for graduate work; and then it would do him no harm should he study abroad for a year or two. Do you say that this would illy fit him for agriculture? I know it need not, for I have the proof. Isn't it the glory of our magnificent country that any boy of will, energy and determination can, all unaided, secure all of this, if he is only so fortunate as to be an American? I know he can, for here again I have the proofs.

I have just been rejoicing in some statistics that fill my heart with gratitude as an American citizen. Our total debt now is \$1,100,000,000. It was three times that at the close of the war. Yet this in the face of the fact that the war cost our Government more than \$6,000,000,000, if we take direct and indirect expenses, such as pensions, etc., into account. In 1860, when our credit was at the worst, we could not borrow money for less than 12 percent. Now our 2 percent bonds are at 8 percent premium. Our present debt is \$14 per capita, Russia's is \$24, with a great army of people who are wholly impecunious. Even England's debt is \$75 per capita; and that of France reaches the alarming

PART OF DR. MILLER'S HONEY CROP SEVERAL YEARS AGO.

sum of \$150 per capita. More than this: All the debt-laden and burden-bearing countries of Europe are sinking deeper and deeper into the slough of debt and despondency, while America is as steadily and surely rising from under the weight of even her small obligation. Under our present wise management our debt will sink to \$600,000,000 in 1908, and will be all wiped out in 1920. I do not need to live to be nearly as old a man as was my father when he left us, that I may with the fullest expectancy look to see our beloved country wholly free from debt.

If there is one topic that may well claim much time about the dear home circle table it is this: "Our Country; the dearest, truest, best the world knows."

DEBTS.

It is a natural and easy step from national to personal debt. Would it be far from wrong to say that a major share of the worry and discouragement of the world comes through debt? Lifting the mortgage is the burden that holds many a man in bondage, and that darkens many a home. It is a privilege which all of us parents ought richly to prize, so to influence in the home circle that our dear ones may never smart under the severe lashings of debt. My father was a living example of the wisdom of the

scriptural text, "The wages of him that is hired shall not abide with thee over night until the morning." The command, "Owe no man anything," meant to my father just what it reads. He taught us children to avoid debt as we would any other evil, and his example always enforced his teachings.

How much of unrest and discontent his kindly influence has saved me. I have never known the worry of debt. Nor has it stopped here. My children have been taught as I was, and I rest in the firm assurance that they will never be harassed by constable, sheriff, or creditors; and thus, as "the evils of the fathers are visited upon the children unto the third and fourth generation," so, too, are the blessed influences of parents carried down not only to second and third generations, but to all our descendants.

It is so easy to contract debts when the habit is once formed. It is so hard to meet them when due. And does not the debt, like any other evil, court the lie and the fraud? And so on to the end of the gruesome chapter.

I heard a story the other day like this: A mother told a boy he must not go bathing. When he came home she said, "John, you have disobeyed me." He looked her sheepishly in the face and denied it. She said, "How, then, comes your shirt on wrong side out?" He replied, "I turned it crawling through the fence."

As surely as disobedience courts the lie, just so surely does debt court untruth, fraud, and imposture.

THE MOCKING-BIRD.

We have him in California. Just the same one that regales our friends of the Carolinas in the East, with his incomparable song. He nests in the pepper near our house. Who would not plant trees if only to attract the bird-singers? I am glad he and his spouse have children, and lots of them. The little nestlings call forth the song. Who could sing if there were no little nestlings? He is not content with hymning his delight in the morning, but pours out his heart's best gratitude at noon and at night; and even in the darksome hour of midnight. Just now one is singing just out my window, as if he would waken, in all, the delight and gratitude he feels. He has done just this for me. I am glad of the trees, the birds, and I revel in the songs of our birds. I do not see how one "with clean hands and a pure heart" can suffer very serious worry or ennui with a concert of bird-music ever sounding in his ears.

MARILLA INCUBATOR COMPANY, BOX 3, ROSE HILL, N. Y.

Farm Wagon Economy.

The economy of this proposition is not all found in the very reasonable price of the wagon itself, but in the great amount of labor it will save, and its great durability. The Electric Wheel Co., who make this Electric Handy Wagon and the now famous Electric Wheels, have solved the problem of a successful and durable low-down wagon at a reasonable price.

ELECTRIC

This wagon is composed of the best material throughout—white hickory axles, steel wheels, steel bounds, etc. Guaranteed to carry 400 lbs. These Electric Steel Wheels are made to fit any wagon, and make practically a new wagon out of the old one. They can be had in any height desired and any width of tire up to 8 inches. With an extra set of these wheels a farmer can interchange them with his regular wheels and have a high or low-down wagon at will.

Write for catalog of the full "Electric Line" to Electric Wheel Co., Box 16, Quincy, Ill. Please mention Bee Journal when writing.

A Good Year for Bees.

This has been a good year for bees, with the exception of a drouth we had in the middle of the season. I commenced the season with four colonies, which I increased to 11, and got about \$30 pounds of honey. The colonies are all strong, with plenty of stores to take them through the winter. I winter them in a shed built for that purpose, packed in straw, and they seem to do well.

The American Bee Journal comes promptly every Thursday, and I always watch for it with pleasure. I could not get along without it.

FRED K. HAWKINS.
Edgar Co., Ill., Nov. 7.

Selling and Shipping Honey.

My attention has been called to a letter on page 670, from C. H. Harlan, who speaks of his treatment by B. Presley & Co. of St. Paul. In justice to a firm which, I believe, holds the highest reputation in the Northwest, I must say that I have shipped honey and apples to them for the past three years, and not only have they always gotten me the highest market price for my shipments, and that without any unreasonable delay, but I have never had to ask twice for a check or a settlement.

I am aware that there are quite as many black sheep among commission men as there are inexperienced shippers among honey-producers. To the former I will give no quarter if I ever come across them; to the latter I will

BEST

Extracted Honey For Sale

ALL IN 60-POUND TIN CANS.

Alfalfa Honey

This is the famous White Extracted Honey gathered in the great Alfalfa regions of the Central West. It is a splendid honey, and nearly everybody who cares to eat honey at all can't get enough of the Alfalfa extracted.

Basswood Honey

This is the well-known light-colored honey gathered from the Rich, nectar-laden basswood blossoms. It has a stronger flavor than Alfalfa, and is preferred by those who like a distinct flavor in their honey.

Prices of Alfalfa or Basswood Honey:

A sample of either, by mail, 10 cents, to pay for package and postage. By freight—two 60-pound cans of Alfalfa, 8 cents per pound; four or more cans, 7½ cents per pound. Basswood Honey, ½ cent more per pound than Alfalfa prices. Cash must accompany each order. You can order half of each kind of honey, if you so desire. The cans are boxed. This is all

ABSOLUTELY PURE HONEY

The finest of their kinds produced in this country.

Read Dr. Miller's Testimony on Alfalfa Honey:

I've just sampled the honey you sent, and it's prime. Thank you. I feel that I'm something of a heretic, to sell several thousand pounds of honey of my own production and then buy honey of you for my own use. But however loyal one ought to be to the honey of his own region, there's no denying the fact that for use in any kind of hot drink, where one prefers the more wholesome honey to sugar, the very excellent quality of alfalfa honey I have received from you is better suited than the honeys of more marked flavor, according to my taste.

McHenry Co., Ill.

C. C. MILLER.

Order the Above Honey and then Sell It.

We would suggest that those bee-keepers who did not produce enough honey for their home demand this year, just order some of the above, and sell it. And others, who want to earn some money, can get this honey and work up a demand for it almost anywhere.

GEORGE W. YORK & CO., 144 & 146 Erie St., Chicago, Ill.

say, consult your "A B C of Bee-Culture" as to the safe methods of shipping comb honey, and don't be surprised if you get low prices for honey which arrives at its destination in a leaky condition.

Notwithstanding our efforts to introduce honey as a staple article of diet, it yet remains more or less of a luxury; and those who can afford luxuries can afford to insist on their grocers supplying them with clean and appetizing ones. Who can then blame the grocers for preferring a case of honey which looks clean and fresh, to one that is sticky, and consequently dirty? WALTER R. ANSELL.

Ramsey Co., Minn., Nov. 8.

Report from Alabama—Bitter Honey.

I have had fair success this year for this locality, considering the very limited time I can give to the bees, working as I do in railroad shops, and having only evenings. For the first time since I have been keeping bees they stored a surplus from white clover. I got about 200 pounds. The flow was stopped by drought, which was followed by excessive rains; then again a very dry spell, so I got no more honey till this fall, when quite late there came a good flow, which proved to be the best fall honey I ever got here, except 2 colonies out of 24 that had bitter honey (from yellow fennel). I do not know the source of the rest, but from the time the flow commenced I noticed a peculiar, faint, sour smell from the hives, stronger in the night; this odor is slightly noticeable in the honey, which was so very thick that it was hard to extract, and could be sold in a week or 10 days, exactly the color of butter. I got about 30 gallons. Have you any idea what plant they got it from? ALBERT E. ISAAC.

Morgan Co., Ala., Nov. 5.

[We can not even guess as to the source. Perhaps some of our Southern readers can tell.—EDITOR.]

Introduction of Queens.

MR. EDITOR:—I am not greatly interested in the philosophical discussion between Messrs. McNeal and Whitney, but I am interested in the matter of introducing queens: ones I want to know it. If Mr. McNeal's plan of introduction may be relied on as safe, there will be advantage in using it, but sometimes a little deviation will result in failure. In one respect his instructions seem hardly explicit enough. He says: "Do not smoke the bees constantly, but smoke and pound alternately, for two or three minutes only." That may mean to smoke two or three minutes, then pound two or three minutes, and so on. If that is the meaning, will he please tell us how long, in all, the pounding and smoking is to be continued? It may, however, mean that the whole time of pounding and smoking is to be only two or three minutes. If that is the meaning, will he please tell us how long to smoke each time, and how long to pound? For it might make some difference whether

the change from smoking to pounding, and from pounding to smoking, was made every two seconds or every thirty seconds.

Another thing: If I understand correctly, it is somewhat important that the queen be introduced in the full tide of laying; or, in other words, that she be taken from one hive and put directly into another without any material stoppage in laying. If that be so, it will be of very little practical use to many. At the most, it could only be of value in the case of taking a queen from a nucleus to be introduced to a colony in the evening. But will Mr. McNeal tell us what about a queen received through the mail—sailed for several days? Or a queen taken to an out-apiary?

It will also help to decide as to the value of the practice, if Mr. McNeal will tell us how many times he has tried the plan, and how many failures, if any, he has had. A. V.

Use of Bisulphide of Carbon.

In the convention proceedings, pages 692 and 693, Mr. Benton, in speaking of the use of bisulphide of carbon as a destroyer of the bee-moth, raises the question whether any one had advocated this prior to his doing so five or six years ago. I wish to state that in the files of the American Bee Journal of 12 to 15 years ago (during Mr. Newman's time), there is a short statement as to its use, for that purpose by G. R. Pierce, of this State. Mr. Pierce does not now reside where he did, and his present residence is unknown to me, but I thought it no more than right to make this statement in his behalf. N. P. SELVEN.

Benton Co., Iowa, Oct. 31.

Selling Honey and Other Things.

"Good evening, Mr. Hustler. I am glad you came, for if I don't talk about bees once in a while I get lonesome."

Now, Mr. H., lives some 10 or 12 miles from my place, but he comes this way once in a while to buy lumber, as there is a saw-mill in the woods near us, and he picks what trees he wants to fill his orders with; so he stays around town till they are sawed, as he wants them at once, and then he has a little time to talk bees.

"Yes," says he, "I have been stirred up lately over some articles of Doolittle's in *Gleanings in Bee-Culture* and the American Bee Journal. In the former he has an article on selling honey, which coincides with my idea of the way to handle anything else should be pushed off your hands, and the 'tin' gotten into your pocket."

"That is all right," says I, "but a good salesman doesn't have to lower the price in order to sell, as he advises. There are always two sides to all questions, and both sides should be made public, for a thing might work well in one locality and not in another. For instance, suppose I sold my honey for one cent per pound, less than it would net me wholesale in the city markets, as I understand by his advice, that is, to sell at 12 cents per pound when it is quoted at 15 cents in the bee-papers, it costing the two cents to market it. Now, he had 100 pounds of honey to dispose of, and can make, by a little push, to sell 700 pounds of it to families in my vicinity for 12 cents, and have 300 pounds left to dispose of, what can I do with the balance? It will not pay me to go over the ground again, for the sales will be so slow that I could not get pay for time, and I do not want to keep it over till next year, so I would better sell it at some price, as there is no one here not enough to sell on commission I go to my village-store and try to get them to take it; they will not handle it short of two cents per pound, and as I have already sold it under their noses for 12 cents, I can not expect to get more than 10 cents for it, so I dispose of the balance at that price. Now, you see, you have the market price at 12 cents retail and 10 cents wholesale, which would be the price everywhere, should bee-keepers follow Doolittle's advice generally. It might be well enough in certain localities, where everything else is cheap, but in my section of the country, where I am getting 20 cents per pound retail, and \$2.00 for 12 pounds at the stores, it would not work at all."

"Now, bear in mind that if Doolittle's

For Thanksgiving Day

The Nickel Plate Road will sell tickets within distances of 150 miles Nov. 27 and 28, at rate of a fare and one-third for the round trip. Tickets good returning until Nov. 29, inclusive. This road has three express trains daily to Fort Wayne, Cleveland, Erie, Buffalo, New York and Boston, with vestibuled sleeping cars. Also excellent dining-car service; meals served on Individual Club Plan, ranging in price from 35 cents to \$1.00. For reservations in sleeping-cars or other information address John V. Calahan, General Agent, 111 Adams St., City Ticket Office, 111 Adams Street, Chicago. Phone 2057 Central. 42-46A-21

advice is followed throughout the country (and of course he meant it for all localities), the selling price would be 10 cents per pound wholesale, for the stockkeepers would pay no more to the city dealers than to the farmer so long as they can buy of the latter. But there might come a time when they could not buy of the bee-keepers, and, the city dealer, seeing his chance to keep the man's trade, sells him honey for 10 cents per pound, until finally the price will fall to 8 cents; then, of course, the commission men will have to sell at 10 cents or less. The freight and commission will have to come out of that, which, according to Doolittle, will bring the honey down so the producer will not realize more than 8 cents, and which will now be the established price. So you see the bee-keeper will have to start all over again, and the egg find himself as bad off as ever. This underselling is one reason why the prices are so much lower now than they were a few years ago."

"Oh yes," says Mr. H., "I see now why men should not jump at everything that is printed in the bee-papers, or in any other papers, before considering the result. I know I once bought some honey-jars that were recommended very highly, and what they had to say about them in their catalog might be all true, but after they had been washed and filled with honey they would break standing still, and so, of course, were good for nothing."

"That General Rejoinder article in long-tongued bees suited me to a dot. The way he accused some people of pushing things in a sort of one-sided way, without at the same time trying to draw out the truth on the opposite side, so that both sides would have an equal show, was pleasing."

"I want to interrupt you there," Mr. H. "Not that I like to see things presented in a one-sided way in the reading columns of a bee-paper in order to sell an article, but whenever anybody has anything new I want to see it shown up in the reading columns of the bee-papers, for, had I not seen some new ideas advanced in the body of the papers, I would be behind the times now, for I do not study the advertisements enough to 'catch on'; but I don't by any means believe in showing up only one side. Therefore, when any one has an article to sell, he should give the best qualities as well as the good. I know it is not always good policy, if you want to make a sale, to show up the worst side prominently, nor is it natural for people in general to do so. A salesman who does not show the good qualities and leave out the bad, is not considered a good man, and I am talking for the interest of the buyer now. There once lived in this town (say 50 years ago) two good men, one by the name of Collier and the other by that of Chandler. Now, Mr. Collier had a cow to sell, and Mr. Chandler wanted to buy one. The latter thought himself a shrewd buyer, and when he got caught he could not squeal, as some do. Mr. Collier told the truth so far as he told anything, but he did not think himself bound to tell any more than was asked. He answered all of Mr. Chandler's questions—that the cow was orderly, would not kick, gave a good quantity of milk, and good milk. She was in good condition, and her tests were not sore, and she did not leak her milk. Mr. Chandler was very particular about asking in regard to the cow leaking her milk. After he had asked all the questions he could think of, he bought her at a fair price. He got her home and tried to milk her, but at first could not get a drop, she milked so hard. Well, the next Sunday, when he was out for his milk, he took her to him to one side and said, 'I thought you told me that cow would not leak her milk.' That was all the kicking there was about it. You can see the moral."

"Good bye." J. L. HYNE.

Queens for Breeders.

"Breed from the best" has been the watch-word with myself as well as others. F. B. Simpson, in *Bee-Keepers' Review*, says we're off. Given five queens from the same mother, which five queens uniformly yield about 40 pounds more than the average, and another five from another mother, which five zigzag all around from 35 below to 90 above the average, and he will breed from the first five rather than from the one that runs 90 above the average. Now, if F. B. will tell us, as I am afraid he will, that all intelligent breeders of note will agree with him, I'll promptly 'bout face and stand in line with him; but if he's only giving his own opinion, I've a choice assortment of abusive epithets laid up for him, and a lot of brickbats to fling at his battlements. I ought to explain that he reasons that the one that runs 90 above the average is a freak that will not give uniform results, while the five of the other mother, being uniform, may be relied upon for future results.—The recommendation of F. B. Simpson is one that we have been carrying out in practice for several years. A breeder whose queens are irregular, zigzagging from one extreme to the other, is one that will cause complaints from customers; but one that will give uniform results in markings,

SWEET CLOVER

And Several Other Clover Seeds.

We have made arrangements so that we can furnish Seed of several of the Clovers by freight or express, at the following prices, cash with the order:

	5lb.	10lb.	25lb.	50lb.
Sweet Clover (white).....	\$.60	\$1.00	\$2.25	\$4.00
Sweet Clover (yellow).....	.90	1.70	4.00	7.50
Alsike Clover90	1.70	3.75	7.50
White Clover	1.00	1.90	4.50	8.50
Alfalfa Clover30	1.40	3.25	6.00

Prices subject to market changes.

Single pound 5 cents more than the 5-pound rate, and 10 cents extra for postage and sack.

Add 25 cents to your order, for cartage, if wanted by freight, or 10 cents per pound if wanted by mail.

Please mention Bee Journal when writing

in profligence, in gentleness, in every one of her daughters, is the one that we select for a breeder—providing, of course, that these daughters all score a high average; but if Mr. S., or any one else, can find a mother, the lines of whose daughters will average in number of pounds of honey about the same under like conditions—well, we can not do it. The daughters of our best breeder nearly all score well in honey, but there is quite a variation. While the poorest will be no worse than the average, the best will be considerably better.
—Editor.—Stray Straw in Gleanings in Bee-Culture.

Breeding for Uniformity.

Readers of the *Bee-Keepers' Review* who have been accustomed to be told that they should always breed from the best, will gasp when told by F. B. Simpson that instead of breeding from their best they should breed from those that are only a little above the average if they are to have any permanent improvement. He says:

The breeding of queens often recalls to my mind the "fooling the public" adage with variations: "We can breed ideal queens once in awhile, we can average fair queens, and we too often produce worthless ones, but we can not uniformly produce superior queens." Why can we not? Simply because the majority have for years bred their bees on a principle founded on a fallacy—they have continually bred from the least uniform, hoping to obtain uniformity!

FOR GETTING NEW SUBSCRIBERS.

Red Clover Queens FOR 1902 Free

Long-Tongue Variety—Warranted Purely Mated.

We have already arranged with the queen-breeder who furnished Long-Tongue Red Clover Queens for us during the past season, to fill our orders next season. Although fully 95 percent of the untested queens he sent out were purely mated, next season all that he mails for us will be warranted purely mated.

We want every one of our present subscribers to have one or more of these money-maker Queens. We have received most excellent reports from the queens we supplied during the past season. And next year our queen-breeder says he expects to be able to send out even better Queens, if that is possible. He is one of the very oldest and best queen-breeders. His bees average quite a good deal the longest tongues of any yet measured. The Breeder he will use is direct from Italy, having imported her himself. Her worker-bees are large, of beautiful color, very gentle, scarcely requiring veil or smoke.

Orders for these fine, "long-reach" Warranted Queens will be filled in rotation—"first come, first served"—beginning as early in June as possible. It is expected that orders can be filled quite promptly (even better than the past season), as a much larger number of queen-rearing nuclei will be run. (But never remove the old queen from the colony until you have received the new one, no matter from whom you order a queen.)

All Queens will be guaranteed to arrive in good condition, and will be clipped, unless otherwise ordered.

A Warranted Queen for sending us Only 2 New Yearly Subscribers

In order that every one of our subscribers who wants one of these Warranted Queens next season can easily earn it, we will book your order for one queen for sending us the names and addresses of two new subscribers to the *American Bee Journal* and \$2.00. Furthermore, we will begin to send the *Bee Journal* to the new subscribers just as soon as they are received here (with the \$2.00), and continue to send it until the end of next year, 1902. So, forward the new subscriptions soon—the sooner sent in the more weekly copies they will receive.

This indeed is an opportunity to get a superior Queen, and at the same time help swell the list of readers of the old *American Bee Journal*.

We are now ready to book the Queen orders, and also to enroll the new subscriptions. Remember, the sooner you get in your order the earlier you will get your Queen next season, and the more copies of the *Bee Journal* will the new subscribers receive that you send in. We hope that every one of our present readers will decide to have at least one of these Queens. Address,

GEORGE W. YORK & CO., 144 & 146 ERIE STREET, CHICAGO, ILL.

How frequently we see the remark: "Whenever I see one queen's colony outstripping everything in my yard, I select her to breed from." As an example, suppose 10 colonies have given the following yields in pounds of honey: 25, 20, 150, 45, 60, 75, 45, 70, 50, 60. Suppose all are equally well bred; the 150-pound queen is "selected." Suppose we find that the first five queens were from one mother, and the last five from another, both of which breeders had given a comparative yield of 60 pounds each. It is evident that the selected queen is the least *uniform*, individually, and also one whose blood shows the greatest variation and the greatest number below the average (it will be noted that the average for each five, and therefore for all, is 60 pounds). We know that 60 percent of her sisters gave yields below that of their mother, and we also know that the average we can expect from her must be far below her own record, and as she is the most variable (from her mother as well as from the average), we can naturally look for even a greater percent of her offspring to go below the average. In short, we are practically certain to get no progress in the breeding operation; progression, if simply because we are breeding from an *individual freak*, instead of from the most consistent representative of the best blood. On the other hand, the second breeding-queen shows but two, or 40 percent below the average, whereas 60 equal or exceed the average, and, therefore, their mother's yield. Therefore, I would breed from the 75-pound, or the 70-pound, or the 60-pound queen, from the second mother.

Light Laying for Feeding Queens.

"Ridiculous" is the label that F. B. Simpson, in Bee-Keepers' Review, puts on the notion that keeping a queen in a nucleus will best longevity in her offspring. Sure. But it had escaped me that any one advocated such a notion. He says his breeders must do their duty in a full-sized hive, so he can compare them with others. All right, F. B.; but after a queen has fully established her reputation I like to give her a light job so as to keep her as long as possible. A queen I'm now trying to winter was born in 1897. I have been doing extra work during four years I felt she would be insulted if I had said, "Now, let's see what kind of stuff is in you." So I gave her a soft job for 1901. [You are doing with your breeder just the very thing that we are doing with our best queen.—EDITOR.]—Stray Straw in Gleanings in Bee-Culture.

Beeswax from Different Countries.

This will by no means always be found the same. An interesting summing up of the different kinds is given in Graevenhorst's Bienenzeitung, and thus translated in the American Bee-Keeper:

In Austria the wax is found or produced in the southern portion, equalling the wax produced in buckwheat localities. The provinces of Bohemia, Moravia and Galicia produce a soft wax, although a distinction has to be made between the wax from the western part of Galicia and that from the eastern part. The wax from the district of Galicia has a pitchy odor, while the other possesses the common odor of wax; is red or brown-yellow, and fairly hard. The best of all known waxes is that from Turkey; it is red in color, and demands the highest price. The wax from Greece and its islands is nearly equal to it in quality. The wax from the southern part of France produces wax of better quality than the north. The wax from Spain is about as good as the best produced in France. Italy produces much good wax.

The wax of India is a grayish-brown, and has almost no odor. The wax produced upon the Islands, as Timor and Flores, etc., is of importance. Quantities of the product have been exported to China, where a great deal is consumed and also prepared.

Egypt, Morocco and the Barbary States furnish a considerable quantity of very impure wax. Beeswax from the Senegal is rather poor and dark-brown in color, accompanied by an unpleasant odor. Very good

wax is produced in Guinea; it is hard and yellow, about as good as Russian wax. The American wax is usually dark and difficult to bleach. From Guadalupe black wax from wild bees is brought into the markets. It can not be bleached out.

CONVENTION NOTICES.

Chicago.—The executive committee of the Chicago Bee-Keepers' Association has ordered that the next meeting be held all day and evening, Dec. 5, 1901, at the Briggs House club-room. This is arranged on account of the low rates to be in force then for the International Live-Stock Exposition in Chicago at that time. Nov. 30 to Dec. 7, being one fare plus \$2.00 for the round-trip. This notice goes by mail to nearly 300 bee-keepers near Chicago, and should result in the largest attendance we have ever had. Dr. C. C. Miller and Mr. C. P. Dadant have promised to present. Let all come.

HERMAN F. MOORE, Sec.
GEORGE W. YORK, Pres.

Minnesota.—The Minnesota Bee-Keepers' Association will meet in Plymouth Church, Cor. 5th St. and Nicollet Ave., Minneapolis, Minn., Wednesday and Thursday, Dec. 4 and 5, 1901. Mr. W. Z. Hutchinson will give a stereopticon lecture on Wednesday evening, and a good program is prepared and now in the hands of the printer. Joining the National Bee-Keepers' Association in a body will be voted on Wednesday. All bee keepers and those who have bees are invited.

H. G. ACKLIN,
Chairman Executive Committee.

New York.—There will be a bee-keepers' convention annual held in Canandaigua, N. Y., by the Ontario and N. Y. Bee-Keepers' Association, Dec. 13 and 14, 1901.
Naples, N. Y. FRIEDMANN GREINER, Sec.

HONEY AND BEESWAX

MARKET QUOTATIONS.

CHICAGO, Nov. 1.—The market is easier in tone, while prices are nominally the same, but would be shaded to effect sales. Some cars of honey enroute to the Eastern cities have been diverted to this and surrounding points, which is having a depressing effect. Comb brings 14¢/lb for best grades of white; light amber, 12¢/lb; dark grades, 10¢/lb. Extracted, white, 5¢/lb; amber, 4¢/lb; dark, 3¢/lb. Favor and package; light amber, 5¢/lb; amber and dark, 5¢/lb. Beeswax, 25¢. R. A. BURNETT & Co.

CINCINNATI, Oct. 25.—The honey market is rather dull on account of the warm weather. Extracted sells only to manufacturers from 6¢/lb; better grades alfalfa water-white from 6¢/lb; white clover from 8¢/lb. Fancy white comb honey sells from 13¢/lb to 15¢/lb.

C. H. W. WEBER.

ALBANY, N. Y., Oct. 25.—Honey in good demand now, as this is the most satisfactory time to sell. Country farmers are stocking up and will buy lines, when later they will only come to piece out. Fancy white comb, 15¢/lb; mixed, 14¢/lb; buckwheat, 12¢/lb. Extracted, white, 6¢/lb; mixed, 5¢/lb. H. R. WRIGHT.

OMAHA, Oct. 25.—New comb honey is arriving by express in small quantities from Iowa and Colorado, and selling at \$3.50 per case in a retail way. California extracted honey is being offered carlots at 4¢/lb to 4¢/lb per pound, i. e., California shipping-pots, but we have not heard of any sales having been made thus far. The production of extracted honey will be quite large this year in Colorado, Utah and California. PEYCKE BROS.

NEW YORK, Nov. 8.—Comb honey is in good demand, and while the market is not overstocked, receipts are sufficient to supply the demand. Fancy white sells at 15¢, with an occasional sale at 16¢ for attractive lots; No. 1, white, at 14¢; No. 2, at 13¢; fancy buckwheat, 10¢/lb; No. 1 and 2, at 12¢; from 10¢ to 10¢/lb. Extracted, remainder of country white, at 5¢, and 5¢/lb to 5¢/lb for amber. Very little demand for dark at 5¢/lb to 5¢/lb. Beeswax quiet at 27¢/lb.
HILDRITCH & SROELKEN.

BOSTON, Oct. 21.—There is a fairly good demand for stocks with ample supplies at the present writing. Fancy No. 1, in cartons, 15¢/lb; No. 1, 15¢; very little No. 2 is being received; glass-front cases will bring about 5¢ per pound less. Light California extracted, 7¢/lb; Florida honey, 6¢/lb to 7¢/lb. BLAKE, SCOTT & LEE.

DES MOINES, Oct. 25.—There is very little doing here in new crop of honey. Some small lots of near-by produced comb honey are on the market and selling in a retail way at \$3.50 to \$3.75 per case. We do not look for much trade in this line before Sept. 1. Our market does not consume a great deal of extracted honey. PEYCKE BROS. & CHANEY.

DETROIT, Oct. 25.—Fancy white comb honey, 14¢/lb; No. 1, 13¢/lb; no dark to quote. Extracted, white, 6¢/lb. Beeswax, 25¢/lb.
M. H. HUNT & SON.

SAN FRANCISCO, Nov. 6.—White comb, 10¢/lb; amber, 8¢/lb; dark, 6¢/lb; cents. Extracted, white, 5¢/lb; light amber, 4¢/lb; amber, 4¢/lb.

Shipments from this port by sea for the season to date agree with the season's crops, mostly extracted, while for corresponding period last year the quantity forwarded outward by water routes did not exceed 1,500 cases. In values there are no appreciable changes to record, market showing steadiness.

KANSAS CITY, Oct. 25.—Up to the present time only small lots of new comb honey have been on the market, and these met with ready sale on the basis of 15¢/lb per pound for fancy white. For next week we hear receipts are expected and quotations are issued at 15¢/lb to 25¢ per case for large lots, which would be equal to about 14¢/lb; the demand being quite brisk, a firm market is anticipated. Inquiries for extracted are a little more numerous, but large buyers still seem to have their ideas too low. In a small way 5¢/lb is quotable. PEYCKE BROS.

BARGAIN!

Apriary of 50 coils, Ital.; 10¢/lb, Lang. for Ext. and comb; good locality all fixtures; and farm kit wanted.

A New Bee-Keeper's Song—

“Buckwheat Cakes and Honey”

Words by EUGENE SECOR.

Mus. by GEORGE W. YORK.

This song was written specially for the Buffalo convention, and was sung there. It is written for organ or piano, as have been all the songs written for bee-keepers. Every home should have a copy of it, as well as a copy of

“THE HUM OF THE BEES in the APPLE-TREE BLOOM”

Written by

EUGENE SECOR and DR. C. C. MILLER.

PRICES—Either song will be mailed for 10 cents (stamps or silver), or both for only 15 cents. Or, for \$1.00 strictly in advance payment of a year's subscription to the American Bee Journal, we will mail both of these songs free, if asked for.

24th Year Dadant's Foundation. 24th Year

We guarantee satisfaction. **

What more can anybody do? BEAUTY, PURITY, FIRMNESS, No SAQING, No LOSS. PATENT WEEB-PROCESS SHEETING.

Why does it sell so well? **

Because it has always given better satisfaction than any other. Because in 23 years there have not been any complaints, but thousands of compliments.

Send name for our Catalog, Samples of Foundation and Veil Material. We sell the best Veils, cotton or silk.

BEE-KEEPERS' SUPPLIES OF ALL KINDS.

Very fine pure-bred BARRED PLYMOUTH ROCK Chickens and Eggs for sale at very low prices.

Langstroth on the Honey-Bee—Revised,

The classic in Bee-Culture—Price, \$1.25, by mail.

Beeswax wanted at all times.

CHAS. DADANT & SON, Hamilton, Hancock Co., Ill.

Texas Bee-Keepers.

New Branch Office. We beg to announce the opening of a branch office and warehouse at 438 W. Houston St., San Antonio, Texas. Rates of transportation from Medina in less than car-load lots are high, and it takes a long time for a local shipment to reach Southern Texas points.

Low Freight and Quick Delivery.

San Antonio as a Shipping-point.

To secure these two necessary advantages—low freight and quick delivery—and to better protect the interests of our Texas friends, is our reason for establishing this new branch office. No other point in Southern Texas is better adapted to serve as a distributing point than San Antonio. It has four great railroads—the Southern Pacific R. R. east and West—the International and Great Northern R. R. from Laredo up through San Antonio and Central Texas, the San Antonio and Arkansas Pass R. R., and San Antonio and Gulf R. R. It also has the American, Wells-Fargo and Pacific Express Companies.

Our Managers.

We have secured as managers Mr. Udo Toepperwein, formerly of Leon Springs, and Mr. A. Y. Walton, Jr., both of whom are well known to the bee-keepers of South and Central Texas. They are also thoroughly familiar with practical bee-keeping and all matters associated with it, and any orders sent to this branch will receive prompt, careful attention.

Our Goods.

As usual, our motto is to furnish the best goods of the most approved pattern. We do not undertake to compete in price with all manufacturers. Bee-keepers have learned that it does not pay to buy cheap supplies, for a saving of 10 cents on the first cost of a hive may be a loss of many times this amount by getting poorly made and ill-fitting material. Every year brings us many proofs that our policy of “the best goods” is a correct one.

Our Catalog.

Very few changes in prices will be made in our new catalog, so do not delay your order, but send it at once. You will be allowed a refund if lower prices are made, and in case of higher prices ruling in the new catalog, if any, you will secure the benefit by ordering now. Catalog and estimates may be had by applying to the address given below.

Our Invitation.

Whenever you visit San Antonio you are invited to call at our office and make it your headquarters. Here you will find a display of Apianian Supplies not equaled elsewhere in Texas. You will also find on file the leading bee-journals to pass pleasantly your leisure time.

Spanish Catalog.

Some of you may read Spanish, or have a bee-keeping friend who does. If so, call for our Spanish catalog. It's sent free.

IMPORTANT NOTICES.

The Subscription Price of this Journal is \$1.00 a year, in the United States, Canada, and Mexico; all other countries in the Postal Union, 50 cents a year extra for postage. Sample copy free.

The Wrapper-Label Date of this paper indicates the end of the month to which your subscription is paid. For instance, "death" on your label shows that it is paid to the end of December, 1901.

Subscription Receipts.—We do not send a receipt for money sent us to pay subscription, but change the date on your wrapper-label, which shows you that the money has been received and duly credited.

Advertising Rates will be given upon application.

National Bee-Keepers' Association

OBJECTS.

To promote and protect the interests of its members.
To prevent the adulteration of honey.
To prosecute dishonest honey-dealers.

BOARD OF DIRECTORS.

E. WHITCOMB,	THOS. G. NEWMAN,
W. Z. HITCHINSON,	G. M. DOOLITTLE,
A. L. ROOT,	W. F. MARKS,
E. T. ABBOTT,	M. J. HAMEAGH,
P. H. ELWOOD,	C. P. DABANT,
E. R. ROOT,	DR. C. C. MILLER.

EXECUTIVE COMMITTEE.

ERNEST R. ROOT, President.
R. C. ALLEN, Vice-President.
DR. A. B. MASON, Secretary, Toledo, Ohio.

EUGENE SECOR, General Manager and Treasurer, Forest City, Iowa.

MEMBERSHIP DUES, \$1.00 a year.

☞ If more convenient, Dues may be sent to the office of the American Bee Journal, when they will be forwarded to Mr. Secor, who will mail individual receipts.

A Celluloid Queen-Button is a very pretty thing for a bee-keeper or honey-seller to wear on his coat-lapel. It often serves to introduce the subject of honey, and frequently leads to a sale.

NOTE.—One reader writes: "I have every reason to believe that it would be a very good idea for every bee-keeper to wear one of the buttons as it will cause people to ask questions about the busy bee, and many a conversation thus started would wind up with the sale of more or less honey; at any rate it would give the bee-keeper a superior opportunity to enlighten many a person in regard to honey and bees."

The picture shown herewith is a reproduction of a motto question-bug that we are furnishing to bee-keepers. It has a pin on the underside to fasten it.

Price, by mail, 6 cents; two for 10 cents; or 6 for 25 cents. Send all orders to the office of the American Bee Journal.

Weekly Budget.

EDITOR W. Z. HITCHINSON gave us a short call on Saturday, Nov. 16, when on his way to attend the meeting of the Colorado Bee-Keepers' Association at Denver, held last week.

EUGENE SECOR, the general manager of the National Bee-Keepers' Association, was recently elected to the Iowa Legislature by a handsome majority. He expects to spend the winter in Des Moines, the State capital.

MR. C. M. SCOTT, for some years the manager of the G. B. Lewis Co.'s bee-supply branch at Indianapolis, Ind., has bought the business at that place, and will continue it under the name of C. M. Scott & Co. Mr. Scott is very highly commended by the Lewis Company, and we trust he may continue to do a successful business.

MR. W. L. COGGSHALL, one of New York State's most extensive bee-keepers, has been in very poor health for some time. Late in the fall he went to a sanitarium about 40 miles west of Chicago, where he is receiving treatment. On Nov. 15 he wrote us that in two or three weeks his physician expected to send him home well. Mr. Coggsshall's many friends will be delighted to hear this. If well enough he may attend the Chicago convention at the Briggs' House, Dec. 5.

MRS. N. NELSON, of Sac Co., Iowa, died of cancer Nov. 11, after months of suffering. In 1882 she married Mr. N. Nelson, who, with five children, are left to mourn her departure. She was a member of the Congregational church from her young girlhood. A local newspaper says Mrs. Nelson was an amiable, thoughtful, patient, loving wife and mother, showing in her life the noble qualities of a high Christian character, and winning unto herself a host of warm friends who deeply feel their loss. Our sincerest sympathy goes out to the stricken husband and children, who, it is a satisfaction to note, "mourn not as those who have no hope."

DR. C. C. MILLER has this to say regarding the meetings of the Board of Directors of the National Association at Buffalo, and also something about certain discussions in open convention:

MR. EDITOR: Those unfortunate Directors' meetings held while the convention was in session at Buffalo, deprived me of the privilege of hearing a considerable part of the discussions, which probably makes me appreciate all the more the excellent and full report you are now giving in the columns of your journal.

Referring to a discussion on page 756, I may say that I have many a time set a hive containing a nucleus in place of a swarming colony, so as to allow the returning swarm to enter the nucleus, and in no case have I ever known the queen of the nucleus to be molested. Of course the old colony was removed, and the queen that issued with the swarm was also disposed of.

It is not often that as much real information is given in so short a space as in the discussion of the succeeding topic. All of the

items mentioned are useful in trying to determine the presence of a virgin queen when she can not be found. Perhaps none of them may be relied upon implicitly. But they will help. The one that I have depended upon as much as any other for years, is the one mentioned by W. L. Coggsshall—cells polished out in the central part of the brood-nest ready for the queen to lay in; and this may be several days before the queen is ready to lay. Sometimes when she is hardly a day old. Somewhat strangely, I do not remember to have seen this mentioned in print, and this shows one good thing in conventions, bringing out from such men as W. L. Coggsshall things that they would never take the trouble to write. C. C. MILLER.

MR. J. M. HOOKER, as may be seen in a late number of the British Bee Journal, has sailed from England for his new home in America. His loss will be keenly felt by the British Bee-Keepers' Association. Mr. Hooker having been one of the seven who originally met to organize the Association, and one who was always foremost in the movement to establish modern bee-keeping. Mr. Garratt probably spoke the general feeling when he said that to hold a conversation without the presence of Mr. Hooker was alone a marked event, and he was sure that everybody who had been accustomed to see that gentleman there would feel that the cause had suffered a severe loss by his absence. Mr. Hooker is cordially welcomed to these shores.

MR. J. T. ELLIOTT AND APIARY are shown on the first page this week. When sending the photograph, Mr. Elliott wrote as follows:

EDITOR YORK:—I send you a picture of my apiary, but it does not show up very well, as it was impossible to get a good view, showing all the hives, etc., on account of the trees and shrubbery. I keep my bees on a city lot, so I have not much extra room for them. I have them under young apple and peach trees, just over the bank at the edge of the garden. The hives being down just over the edge of the bank is why they do not show up better.

I have 21 colonies, all in one row, and work them for both comb and extracted honey. As I am employed as clerk in a railroad office, I do not get much time to work with the bees, only a very few minutes at the noon hour, and a little while mornings and evenings, when the weather is favorable. I find great pleasure in working with the bees, and find them very profitable, also in supplying my table three times every day with honey, which is more healthful than jellies, jams, etc. Then I can dispose of all my surplus honey to my neighbors at a fair profit. My bees did fairly well the past season, the surplus all being from basswood and sweet clover.

J. T. ELLIOTT.

THE DELINATOR.—The Christmas number of the Delinator is about the first of the special Christmas issues. It is a beauty. The cover is a most artistic production, showing a beautifully crowned woman, standing gracefully in a brilliantly lighted salon. Two charming love-stories, one by Cyrus Townsend Brady; plenty of advice regarding Christmas Gifts; timely pointers on Cookery; Winter-time Care of Plants; all the fashions of the day interpreted into simple language, can be found in the Christmas number of the Delinator. It is a splendid magazine, satisfactory inside and out. There is no magazine for women at present published that is more practical in all its pages. As a Xmas gift itself, it bears its own recommendation. \$1.00 a year, or 15 cents a copy. Butterick Publishing Co., Ltd., 7 to 15 W. 43rd St., New York, N. Y.

ESTABLISHED IN 1861 AMERICAN THE OLDEST BEE-PAPER IN AMERICA BEE JOURNAL

CHICAGO, ILL., NOVEMBER 28, 1901.

No. 48.

* Editorial. *

The Chicago Convention is to be held next week Thursday—Dec. 5—beginning at 10 a.m., at the Briggs House, northeast corner of Randolph St. and Fifth Ave. There will also be an evening session.

We are expecting a large attendance, as there are many bee-keepers in Chicago and vicinity, and we have received notice from a number from a distance who expect to be present.

Come, and bring with you as many questions as you would like to have answered. Dr. Miller has promised to come, and bring with him a good supply of answers, which, with the other able experts that are expected to be present, there ought to be no difficulty about taking care of several boxes of questions. There will also be a few papers on practical topics, that will help start interesting discussions.

Come along, and help make this meeting of the Chicago Bee-Keepers' Association equal to the best "Northwestern" ever held.

Comb Honey by Weight or Case.—On another page Messrs. R. A. Burnett & Co. write on the subject of selling comb honey by the case or by weight. We agree entirely with them. In our opinion there can hardly be any valid reason advanced in favor of selling comb honey by the case to wholesale dealers, or to retailers. We have handled quite a good deal of comb honey, but have never bought any by the case, except in one instance where we had it sold before getting it ourselves, and our buyer being willing to take it by the case. For our own grocery trade we do not think that we could be induced to purchase honey by the case. We would have to sell it out by weight to the retail grocers.

Sometimes selling by the case proves a great loss to the producer. We remember once hearing of a carload of comb honey that was sold to a certain firm by the case, on which they cleared beyond a fair profit the sum of \$400; and just because they sold it out by the pound, the car of honey averaging enough more pounds per case to equal that amount, or enough to pay the freight. Had that car of honey been sold by weight in the first place, as it should have been, the producers would have been about \$400 better off. So much for the producers standing in their own light.

We hope that bee-keepers will see that it is

to their best interest to deal squarely, and not encourage a kind of buying and selling that can not well be defended as honorable and upright. Gains gotten by any other than straight dealing can be only of temporary benefit. The firm or individual whose policy is even tainted with deception, or by what is known as "smart dealing," has its days already numbered. "What shall it profit a man if he gain the whole world and lose his own soul?" There are some things of more value than dollars—their worth can not be estimated in money. A man is really worth what he is, not what he has. True character and a good reputation are everything in this life, and a "blessed assurance" of the higher and better life that is to come.

A Good Hive-Cover is a thing that is not in universal use, and the interesting discussion reported on page 735 of this journal shows that the demand for a satisfactory cover is becoming so insistent that manufacturers can hardly afford to ignore it. One trouble has been that the matter of cost has cut too large a figure. A plain board with cleats on each end can be had for a small sum, and in some respects it makes an excellent cover; but no matter how many good qualities it may have, a single bad quality, if bad enough, is sufficient to condemn it. The plain board cover has more than one bad quality, but one that is sufficient alone to condemn it is that it will twist. Cleats, if strong enough, may prevent warping, but cleats of cast iron can not prevent twisting, if a board is inclined to twist. Unfortunately too many of them have that inclination, and when a cover twists so that one corner lies a fourth inch or more above the hive, the days of satisfactory service for that cover are over.

Perhaps the easiest way to secure a non-twisting cover is to have it consist of two layers of wood, the grain of the two layers running in opposite directions. A dead-air space between these two layers will make the cover cooler in the hottest weather, and warmer when the outside temperature is lower than that in the hive. Such a cover covered with tin and painted might be furnished at a cost not beyond reach, and it is possible that some kind of painted paper might do nearly or quite as well as tin. Now that attention is so strongly turned in that direction, the right thing will probably be in sight before long.

The Minnesota Convention is to be held Wednesday and Thursday, Dec. 1 and 2, 1901, in Plymouth Church, corner 8th St. and Nicollet Ave., Minneapolis. The first session is at 9:30 a.m. on Wednesday. A very good program has been published in con-

tion with that of the State Horticultural Society. This is a good arrangement, both organizations meeting on the same dates.

Besides the question-box and usual business of the sessions, we find the following special features on the bee-keepers' program:

Song—"The Honey-suckle and the Bee"—Miss Edith Dexter.

"Should We, or Should We Not, Join the National Bee-Keepers' Association?"—C. Theilmann.

Song—Wm. Reuter and Miss Mary Reuter. "Some Facts in Favor of Joining the National Bee-Keepers' Association"—J. P. West and Mrs. H. G. Acklin.

President's Address—Wm. Russell. Song—"Buckwheat Cakes and Honey"—Master Eddie Holmberg.

"Some Problems and Queries in Practical Bee-Keeping"—J. W. Murray.

Song—Miss Julia Blondel. Bagpipe Selections—Wm. Russell. Scotch Dance—Miss Maggie Russell. Music, Songs, etc., by Students of State Experiment Station.

Stereopticon Lecture—W. Z. Hutchinson. "Large Hives and Prolific Queens"—W. J. Stalmann.

"Queen-Rearing"—G. R. Frye. "Some Experience in Keeping Bees Fifty Years"—Wm. Cairncross.

Song—"Hum of the Bees in the Apple-Tree Bloom"—Little Miss Ethel Acklin.

"Disposing of the Honey Crop to the Best Advantage"—A. D. Shepard.

"Shade and Ventilation"—Walter R. Ansell.

"Wintering Bees"—J. B. Dexter. "Bucking Against Nature with Bees"—John Collins.

Please do not forget to buy your tickets for the Horticultural meeting, and take certificates for them to get the reduced railroad rate.

Surely, that is a lively program, and exceedingly musical as well. But why shouldn't the bee-keepers during the summer imbibe the happy hum from the bees, and then pour it out for convention enjoyment in the winter time? Those Minnesota folks are coming up, and the Colorado people must look well to their laurels, else the greatest State convention of bee-keepers will be no longer out near the great "Rockies." Hurrah for Minnesota! May its bee-keepers have a glorious time, Dec. 1 and 2.

Nominations for the National.—Editor Root, in commenting on our suggestion about having the annual national convention make nominations for the election of general manager and three directors, early December suggests that it might be unwise to change general manager very often. A 1902; they re-nominate him among the three candidates, and also re-nominate among the nine the three directors whose terms expire, if thought best.

See page 631 for our former editorial on this subject. It is a matter worthy of earnest consideration.

The Buffalo Convention.

Report of the Proceedings of the Thirty-Second Annual
Convention of the National Bee-Keepers' Asso-
ciation, held at Buffalo, New York,
Sept. 10, 11 and 12, 1901.

(Continued from page 743.)

The Wednesday evening session was treated to an exhibition of stereopticon views by Pres. Root and W. Z. Hutchinson.

THIRD DAY—MORNING SESSION.

The convention was called to order by Pres. Root, who called upon Dr. Miller for prayer.

The Canadian members present were asked to rise to their feet, and, on being counted, there were found to be 12. F. A. Gemmill, of Ontario, Canada, then spoke as follows on the subject of

Wax-Presses and Their Use.

In regard to the matter of wax-presses, I might say that some years ago my bees had foul brood. Of course, that is a bad disease, but it is no disgrace for a man's bees to have it, but it is a disgrace to keep it; and in melting up many of the old combs I found that I could not get all the wax out—that is, those containing many cocoons and pollen—without using pressure in some form. I looked over the bee-papers and bee-books, and, among others, the "A B C of Bee-Culture," and I saw some illustrations of old presses, the Hatch press, and I combined the two and made a press, the Hatch-Gemmill press, which I think it would pay any one to use. I wouldn't say that press alone, but a press of some kind where strong pressure is used.

I might say that I tried the Doolittle plan of melting the old combs in a gunny-sack, using a large press, and as the wax was boiling the lever was brought to bear on the wax and the wax squeezed out. I tried the plan of putting them in gunny-sacks and sinking them in water. It was very good; of course, it requires quite a little boiling in order to get all the wax out. It is a better plan, maybe, than using the steam wax-press where the refuse is allowed to remain on the bottom, for this reason, that if the gunny-sack is sunk in the water at the bottom, the wax will rise to the top; in the other case, if you use the steam, the refuse will go to the bottom and remain in the cocoons and stay there unless pressed out.

Then I tried other machines, the Ferris and one or two others, and I have nothing to say against any machine, only that my experience proved that where I used either boiling water or steam I had to use the pressure in order to get all the wax out of the refuse.

I also melted combs in the Boardman, still I found that with old combs with cocoons and a large pollen-mass it was impossible to get all the wax out. If left in the extractor for a week there

would still be some there; the cocoons acted as a sponge and retained it, so that I think those that have been using the solar wax-extractor for old combs and throwing the refuse away have lost quite a little bit of wax. I was quite amused at Mr. Root's reference to Mr. Mendleson buying up the slumgum in California and using a press that paid him to get the wax out of it.

I don't know that there is much that I can say. If there are any questions that you wish to ask I would be happy to answer them. I might say that my first article in regard to this matter appeared in the Review, and since that time Mr. Root has been in California and he has fallen in line with the same ideas that I had in regard to the press. We had some correspondence in regard to it, and I believe he is now manufacturing a press that I believe is a good thing. I hope to have the pleasure of trying it shortly.

F. A. GEMMILL.

Pres. Root—This question about being able to get all the wax out of slumgum is a very important matter, because bee-keepers for years have been throwing away dollars, and now they have come to know there is wax in that slumgum.

A Member—How do you avoid getting propolis in the wax?

Mr. Gemmill—The propolis will come out with the old combs, to a certain extent. In our country [Canada], however, we don't have a great quantity of it.

Mr. Betsinger—How long do you think it would take to pay for such a machine? How much does this machine cost?

Mr. Gemmill—About \$3.50 to \$4. But Mr. Root's machine is an improvement, in some ways. Of course, it will cost more.

Dr. Miller—Suppose that you have combs enough from which you get about 100 pounds of wax in the ordinary way. Now the slumgum from that contains yet how much wax?

Mr. Gemmill—That depends upon the method you employ. If you use the plan of sinking the gunny-sacks in the bottom of the boiling water you will get more if you boil long enough, than you will get out of a steam or solar extractor where you allow the refuse to remain in the bottom of the steamer, for the simple reason that it is retained there the same as a sponge retains water. I found that I could get more wax out by boiling according to the Dadant plan. I would get about $\frac{3}{4}$. I can get a third more, easily, than with the steam process, and a third more by using the press.

Dr. Miller—That is, a third of the wax is still left in the slumgum?

Mr. Gemmill—That is, it would be left in Mr. Root's steamer provided he didn't use the pressure.

Mr. McEvoy—No bee-keeper, in your experience, can afford to do without a press?

Mr. Gemmill—I say any man that has any colonies at all, and has any old combs to melt up. Where one has any old combs that have been used for some years, and that contain pollen and cocoons, I think that that man should use a press.

Dr. Miller—How many colonies?

Mr. Gemmill—25 colonies, anyway.

Dr. Miller—How long should the wax be boiled when the pressure is used on it?

Mr. Gemmill—I allow it to come just to a boil, and boil smartly for a short time. Just get it to flow freely. After you apply the pressure it doesn't require boiling very long.

Mr. Betsinger—Five minutes, probably?

Mr. Gemmill—About that.

Dr. Miller—I see the instructions are, in making the pressure, to turn down a certain amount, then wait awhile and turn again. Does any harm come from pressing too rapidly?

Mr. Gemmill—I find that you have got to give the wax a little time to ooze out through the cocoons. Now, there is just one point there. After you have pressed all you think you can out of it, if you use the steam, you can take a kettle of boiling water and pour on the refuse that will still remain, and that will help to free any wax that it may still contain. Then you can apply pressure again, or you can turn over the refuse two or three times and then apply it, but it will do no harm to try the hot water.

Mr. Betsinger—By using old combs and putting it through this pressure would there be any color in the wax?

Mr. Gemmill—Oh, no, it would be perfectly yellow. It is squeezed right through the combs. It is forced right through, and the dirt is retained. Of course, you will understand, in the press it is confined in a small sack that acts as a filter or strainer.

Mr. Betsinger—Will the propolis go through that, too?

Mr. Gemmill—O yes, it will go through.

Mr. Davidson—Do you think such wax is as good for making foundation as other wax?

Mr. Gemmill—I couldn't see any difference. I don't see why it should not be. There is nothing in it but pure wax.

Mr. Davidson—I find that with several grades of wax used in sections, some grades are not accepted as readily as others, and I had the idea that section foundation made with old wax, that is, wax from old combs, would not be accepted as readily as foundation made from newer wax, that is, from newer combs.

Mr. Gemmill—I must confess that I haven't had any experience in that line.

Dr. Miller—In getting out wax from combs, we are directed, or have been in the past, to break them up carefully, and to soak them beforehand. Now, is anything of that kind desirable or advisable in this method?

Mr. Gemmill—It is not required where you use pressure.

Mr. McEvoy—In regard to wax being hard and soft—the lighter color

the wax from the press the softer the wax. The wax from cappings should always be used in foundation for sections. It is nicer.

Mr. Gemmill—The cappings from combs that are melted in the solar extractor are a great deal harder. There are other things in the cappings besides wax.

A Member—I was speaking of old wax that is gotten out by any process. Doesn't wax by age lose something that it requires?

Mr. Gemmill—I couldn't say in that respect.

Dr. Miller—Now, I think you are all such careful bee-keepers that you never have combs melt in the sun. A certain bee-keeper who lives where I do sometimes has that happen, and the thing that surprises me is the amount of yellow wax that the sun wax-extractor will get; and another thing that surprises me is the softness of that wax, and I very much doubt if there is any hardness increased in that wax.

Mr. McEvoy—I think that is correct. Mr. Callbreath—Should the combs be soaked beforehand, or doesn't that make any difference?

Mr. Gemmill—It doesn't make any difference where you use boiling water and pressure, provided you use pressure afterwards. Of course, according to the Dadant plan, you soaked the combs for 48 hours before, those having many cocoons and much pollen, and then immersing them in the boiling water. But the point is this, that if you use pressure you don't require the same amount of boiling, because you force the wax right through the pollen.

Mr. Vinal—As I was going to say, I think this foundation the bees would not accept was a soft grade of foundation, and my idea was that the wax by age loses something that the bees require in order to mould their foundation over; and a foundation not having that, the bees will not work it as rapidly as they will foundation made from new wax. This is my idea, because my bees would not work certain foundation.

Mr. Gemmill—I would like to say that since using the press, I have noticed quite a number of bee-keepers who were retaining old combs that were defective in some way, and I might mention Mr. Hall, of Ontario, for one, who was going to make foundation one day, and I got my son to go down to assist him. My son took the press down with him, and all the time he was making foundation in the forenoon he was talking press; and at the noon-hour my boy went out and got the press a-going, and got a lot of the slumgum that Mr. Hall had been throwing away, and began pressing the wax out of it. Mr. Hall looked at it a moment, and said he would get a press. He got a press and has melted up several thousand combs since, and he doesn't want any old combs around his yard now. He is a very conservative man in his ideas. I think there are many bee-keepers here who, if they were using a press with high pressure, would be pleased with the results.

Mr. Howe—This gentleman asked about foundation being acceptable to the bees after getting old. I had some foundation that was put in sections four years ago, and I kept it where it was dark, and I couldn't see but what

the bees accepted this foundation as readily as they did new foundation put in this year.

Mr. Benton—I want to ask Mr. Gemmill if it wouldn't answer, in applying that pressure, to put a heavy weight on instead of being obliged to watch it and screw it down, so that it would act automatically?

Mr. Gemmill—You would have to use great pressure, and it would have to be coming down constantly.

Mr. Benton—It would be coming down constantly.

Mr. Gemmill—You would require a great weight. People have no conception of what a screw will do in regard to the amount of pounds that it will press down, and you want to be sure, in getting the press, to get a machine that will have a strong screw. You will be astonished at the amount of pressure you can use. I wouldn't recommend a weight at all; you would want to have hydraulic pressure, or something of that kind, if you were going to use a weight instead of a screw.

Mr. West—I endorse the pressure of getting out wax. I have used the pressure, as has been mentioned, of pressing under water and letting the wax rise to the top, and in every case I find it is necessary now and then to raise the screw to let the water in. But since using that, we have gotten into the habit of using a radically different way of melting our wax. We use the same tank, put our hot water and combs in, and let them melt, and then we have a dish that we lay in a cheese-cloth, on one side, and we use a large dipper—a 3 or 4 quart dipper to dip it—and get that cheese-cloth and put the pressure on there, and draw the wax out in another place. We get the wax, we think, pretty nearly clear in that way.

Mr. Gemmill—Of course, I am not informed as to the best methods of applying the screw, but I say apply the pressure in some form.

Mr. Benton—The reason why I asked the question in regard to the weight, it seems to me we ought to give our German friends some credit. We are apt to poke fun at them and call them slow, but they have been using the wax-press all the time.

Mr. Gemmill—I am not a German, and have not come in contact with any German bee-papers, but I understand that Mr. Holtermann, formerly of the Canadian Bee Journal, had made some copy of the old German press, and, of course, they were using the screw there long before I knew anything about it in that form.

A. L. Root—The Germans were original in the use of this press in connection with steam and hot water, and because they were original we named our machine "German," because we thought the credit ought to go where it belongs. I found they had used it 12 or 15 years ago.

Dr. Miller—If you are going to quote the Germans, I think you ought to go a little further and say that many of them are beginning to abandon the steam press for hot water, and they are now saying that hot water is better than the steam—under pressure, you understand.

Mr. Gemmill—By putting the combs into the gunny-sacks and sinking them under water more wax will be secured

than in the steamer; the wax will rise to the top, and if you do the pressing in the hot water the water will carry the wax to the surface.

A. Laing—Last spring I melted up about 100 pounds of wax. I tried the same wax-extractor that I had many times before, and I got somewhat discouraged and discarded it for a good-sized, ordinary kettle which I used on the stove, with hot water, and I found that I made about three times the progress with the hot water in melting that I did with steam.

W. L. Coggeshall—Hot water is the thing to do it with, I think. It will do it much better than steam, with me. I use an ordinary caldron kettle, and I can make 100 pounds of wax in half a day without any trouble.

Dr. Miller—Does Mr. Coggeshall use pressure?

W. L. Coggeshall—No, I haven't used pressure, but I think it is the proper thing to do. I usually put the pressure on by fastening a stick across the top of the kettle and then put a screen over the top and take the wax off the top. It is the proper caper. I just put an ordinary strainer over the top and move it around and take the wax off.

Mr. Laing—What kind of a kettle do you use?

Mr. Coggeshall—A four-barrel kettle. Dr. Miller—Was that called the old Jones extracting kettle? Was there pressure used?

Mr. Laing—There was pressure used. I have nothing against the pressure, but the press I had was too small for the purpose in the first place, and the steam melted it more slowly, and for that reason I melted the wax first, then poured it into the kettle and put on the pressure.

Mr. Craig—The first set of wax-presses that were sent out, that is with the pressure, was an attachment to what is known as the old Jones press, and we found that it required too much heat to generate the steam and so we discouraged that, making a machine with a copper bottom that sets down in the stuff like an ordinary tea-kettle; and this, we find, works very much better, and requires very much less heat.

Mr. Alpaugh—Mr. Gemmill has told you more than I could tell you, about five times over. I melted only a few old combs, and I did it with hot water and pressure, on Mr. Gemmill's principle.

Mr. Gemmill—Mr. Alpaugh has an idea in regard to this matter that I should like to hear.

Mr. Alpaugh—My idea would be to have a large melting tank, something you could get lots of stuff in, anyway, and have a division in this, and in the division a pair of rollers set perfectly tight so that they would work on the principle of a wringer, so that you could wring the stuff through from one side to the other and keep the wax back, which it would do if they were set tight at the ends; and just keep feeding it in thin, flat sheets. When you come to press this old comb the trouble is to get it in small enough quantities and not to have too slow a job. My idea would be to feed it through rollers in a thin layer and grind it through under low pressure, the same as wringing out clothes.

Mr. McEvoy—How would it do to put the combs through a cutting-box first?

Pres. Root—I believe Mr. Alpaugh is on the right track. In order to, put pressure on the combs you have to get it down to a thin sheet. The bulk of it perhaps would be the depth of a basket, and when squeezed down should not be more than an inch thick. Mr. Alpaugh has the right idea of having a wringer, or something of that kind, that would yield enough so that this slumgum could go through in thin layers.

Dr. Miller—I believe that Mr. Alpaugh has a good thing and a bad thing together. I believe he has the right idea in the one respect, that you want a thin layer; but here is the trouble with the wringer business: You attempt to put a towel through a clothes wringer and you get the least start the towel will go through; but suppose it is torn in two, only the half of it will go through, and there is nothing to catch the next particle, and it will simply squeeze and pack, in ordinary, actual practice. I don't believe you could get the thing to go through, but I believe Mr. Alpaugh has the right idea, that there should be some kind of arrangement that will get the thing through.

D. H. Coggsball—I take a bran-sack or a gunny-sack and re-sew them so that they won't rip at the edges, and put the wax or combs into that; then I make a pair of squeezers 3 feet long, use a large caldron kettle and put the sack of wax in, and keep the upper one going, working back and forth, through these squeezers—keep working it back and forth. Of course, if I have black combs there is not so much wax in them. I have tried every way, boiling it under water. There are lots of little particles of wax in the slumgum. You have to work it under water while you are pressing it. I keep two sacks, one heating while I am squeezing the other. I get lots of water in the can I am cooling it in. Then draw the water off at the bottom and take the wax out. I made a division in the kettle and put in wax on one side and boiled it and boiled it; put it under a weight, thinking that I could get the wax out that way and leave the slumgum, but when I came to take the slumgum out there were lots of particles of wax in it. To make the squeezers I take a board a foot wide for the bottom one, and the upper one not quite so large. Take combs when cold and pound them all up; put them under hot water, and squeeze them in these squeezers. I can get it that way. I think that is the only correct way to get it.

Mr. Alpaugh—I understood you to say there wasn't so much wax in black combs?

D. H. Coggsball—Of course; there isn't much refuse in cappings; there would be a little.

Mr. Alpaugh—You mean to say a comb that has been used several years hasn't as much wax in it as one that is used for a year or two?

D. H. Coggsball—It seems as if there wasn't so much.

Mr. Gemmill—It is in the slumgum. I would like you to send me a little of that slumgum. I know a gentleman who sent me 20 pounds of refuse, and I got seven pounds of wax out of it.

Mr. Baldrige—I would like to know if there is any test to know when we have all the wax out of the slumgum.

Mr. Gemmill—The only way is to keep pressing until you can't get any more out of it. I don't care how much you press it, if you throw it into the fire you will see there is a little left in it.

The chairman was called from the room, when Mr. Gemmill presided.

Mr. Barb—I would like to know how the wax is prepared after going through the press?

Mr. Gemmill—The way I have been in the habit of doing, after I had all the wax gathered together and wished to remold it, I generally used the steam extractor without the pressure, just merely to melt the wax. In the top of that I put a wire clothes-basket sunk down, and inside of that I laid a very fine piece of old cheese-cloth; then I put this into the steamer, and in the lower portion I put on the lid of an old pot so as to keep the wax from running down into water, and I retained all the refuse, and a lot of the propolis, too, will remain in this cloth. There will be very little pollen. The wax is forced out of the pollen and the cocoons. There will be a little propolis and some particles of dust.

W. L. Coggsball—To clarify wax, a teaspoonful of sulphuric acid will do for 100 pounds. Be careful not to put in too much.

Mr. Callbreath—What kind of a vessel do you use?

W. L. Coggsball—Pour it into a tin vessel.

Mr. Callbreath—Won't the sulphuric acid eat the tin off?

W. L. Coggsball—It eats the dirt, not the tin. That is what cleanses it.

PREPARING BEES FOR WINTER.

“What is the best method of preparing the brood-nest for wintering?”

Mr. McEvoy—About October 1. I like to bring the bees successfully through the winter with the least consumption of stores, and that is a thing that I worked on for quite a while in my early days of bee-keeping. To make a success of that I found the only way to do was to send them into winter with sealed stores, confine them to about five or six combs, according to the strength of the colony, and if there comes a warm spell in January there isn't the chance for them to commence much brood-rearing, but when I wintered them on a full set of combs and left an open center, and a warm spell came in January, young queens would start laying, the cluster would become broken, and spring dwindling would take place. I try to send every colony into winter with sealed stores, crowded on the least number of combs, and when I haven't sealed stores to do it, I feed until they are filled.

Mr. Callbreath—Beginning before October 1 to feed?

Mr. McEvoy—Sometimes before and sometimes after, and where I didn't begin to feed until after the nights got cold, the bees wouldn't go up in the feeder, but by placing the feeder underneath so as to bring the food within about 1/2 inch of the frames, a night in October when the ground was covered with white frost, they would go down into this and take up perhaps seven, eight or nine pounds some nights, whereas, if I put it above they would withdraw, and I would lose the colony by not feeding early. I like the combs all sealed. It is work, but it pays.

Mr. Callbreath—Do you begin feeding after brood-rearing has ceased?

Mr. McEvoy—Yes; and if I find that brood-rearing continues, I shut it off. I give them sealed stores and shut it off in that way.

Mr. Callbreath—Won't the feeding start brood-rearing?

Mr. McEvoy—I do it so suddenly that it won't. If I do it slowly it will waste the stores, and start brood-rearing. If I can feed them up in one or two nights, I do it. The sooner you do it the better.

Mr. West—Is that for wintering outside or indoors?

Mr. McEvoy—I have them out and in, both. Of course, in the latitude [Ontario] I am in I like outdoor wintering; but for indoors it will do equally as well.

Mr. Barb—Doesn't it make it too cold in the hive to have the bees on so few combs?

Mr. McEvoy—No, the bees are crowded on these, and when they get any honey, instead of hunting all through the hive, all they have to do is simply to lean forward.

Mr. Barb—How far apart do you have the combs?

Mr. McEvoy—The regular distance, about 1 1/2 inches from center to center. As soon as the honey is out of them in the spring I want them ready for breeding.

E. R. Longnecker—Suppose there are combs containing brood when you begin to feed, what would you do with them?

Mr. McEvoy—At that season of the year there is very little brood; but if there is, I take the next weakest colony and put it in that.

Mr. Callbreath—I would like to ask Mr. McEvoy if doubling up two colonies, one very strong, the bees could not be left on the full set of combs with plenty of honey. Will they commence brood-rearing early in the spring without any bad results?

Mr. McEvoy—Some years I have been caught with perhaps in a hundred ten of them would be upon the full set. I would find that I had several that was nearly solid with honey. I would let that one go to the last; but taking all in all, from year to year, I found that ten of them would not average up with ten of those that I prepared. Some of them would be just as good, but there wouldn't be an average in ten that would equal ten that I had prepared, so much so that I do not want one colony in 100 on full stores. I want them on less.

Mr. Callbreath—I am not quite satisfied. My experience is that the colonies that are heavy with honey in the fall, without any feeding, without any attention on the part of the bee-keeper, are the colonies that have poor queens, and not a very great many young bees; and such, of course, would be likely to drop out in the winter or the spring.

Mr. McEvoy—Sometimes I find it so, too.

Mr. Callbreath—Such colonies would be likely to make a poor showing the next year.

Mr. McEvoy—Do you winter bees outside?

Mr. Callbreath—Yes, sir.

Dr. Mason—How many frames do you put a good, fair colony on?

Mr. McEvoy—Five or six, according to the strength.

Dr. Mason—In preparing my bees for winter, about the middle of September, I select what brood there may be and put it in one side of the hive; then I commence with combs of honey and fill the remainder of the hive. I winter bees in the cellar, of course, and I don't have any spring dwindling, and they begin to breed in January. I wouldn't give a cent for them if they didn't begin in January. I have had

bees that came out of the cellar stronger than they went in in the fall, and no dysentery or spring dwindling. That is the difference of locality, I suppose.

Mr. McEvoy—No, it is the difference between indoor and outdoor wintering.

Mr. Niver—I would like to ask Mr. McEvoy the cost of this contracting the brood-nest, how much he would take to contract Mr. Cogshall's 2,000.

Mr. McEvoy—I don't think I could ever get through with it, because I guess he has over 2,000 colonies.

A Member—I would like to ask Mr. Cogshall at what time, if he ever has any feeding to do, he does it?

W. L. Cogshall—I never yet fed any sugar. I always have honey enough.

Selling Comb Honey by Case vs. Weight.

BY R. A. BURNETT & CO.

FOR some little time there has been an effort made to sell comb honey by the case and count of sections instead of by the actual weight of the honey contained therein. There is before me as I write two letters, from parties desiring to sell their honey in this way; namely, so much per case of 24 sections, without reference to the actual weight of honey contained in the case. Both of these parties (who are car-load shippers) were requested to name their price per pound. In reply to that letter, one of them writes:

"In reply, I will state that it is not possible to quote any honey by the pound, for the reason that the different honey producers use different weight cases, and it would be an endless task to arrive at the net weight of 1000 or more cases."

The other one writes:

"In reply to your favor of the 26th inst., I beg to say that we make a rule to sell by the case only, as selling by the pound would put a premium on the non-separated honey, which is not as satisfactory to the dealers as the nice separated article, which is much more even in weight and less liable to injury by careless handling. We hope that selling by the case will soon come into more general use."

We hardly care to make any comment on the foregoing quotations, but merely introduce them so that the reader may know that there is more or less honey in the comb being offered for sale in this way. To say that by selling by count is more satisfactory than buying by the pound brings to our memory the old adage so often repeated, that, "It is never wise to buy a pig in the bag," for, in all probability, it is a pig, yet when the bag is removed it may not at all meet the expectations of the buyer.

It may be conceded that some, if not many, of our expert bee-manipulators can get the bees to store in each section a given quantity, filling each section with no more, or no less, than is contained in all the neighboring ones; now if this were the case generally, the use of scales might well be abandoned; but if it takes the bees longer to put 16 ounces of honey into a section than it does 12, and a correspondingly longer time to put in 12 than it would nine, is it not reasonable to infer that some man less scrupulous than his neighbor would manage it so that he could get a little less honey in the section, and thus a greater lot of sections filled in a given time by the bees than his neighbor could? He would then be able to get as much money for the number of sections as his neighbor produced, and, having produced a fourth or a third more filled sections, he would be that much better off financially than his neighbor; and the purchaser would have that much less honey for an equal sum of money; therefore, it would be only a little time before a case of 24 so-called one-pound sections, instead of weighing from 22 to 24 pounds, as was supposed to be the case at the beginning of this method, we soon find that the cases, while containing 24 sections, in many instances weigh from 17 to 19 pounds.

Although this method of selling honey in any quantity has not been in vogue more than three or four years, already we find a 24-section case to weigh nearer 19 to 20 pounds than 23 to 24; yet there are some producers in a collection of a thousand cases of comb honey, whose cases weigh from 23 to 24 pounds, while others run from 17 to 19 pounds, there being no apparent difference in the grade of honey when viewed through the glass exposure, but there is, when sections are compared with one another, a noticeable difference in the thickness of the comb.

If all men were evolved up to one standard, there would be little need of checking one's accounts against another, but inasmuch as we are not yet as a whole, at the stage where we will not practice deceit, for the sake of personal gain—a false gain to be sure, but, nevertheless, one that is daily practiced by a very great number of us—and the desire that is so prevalent to excel our neighbor in getting the best of a bargain, is so constantly in mind that this method of selling honey by the case without reference to the net weight of the contents is a great temptation to a moral nature not overly strong. It would be as fair to buy our sugar and tea by the bagful without weighing it, because the merchant says, "My bags hold just so much in weight and it is unnecessary to weigh the goods I serve you for so much," while it is true that since paper bags are made by machinery they vary but little in size, the machinery being so nicely arranged that it cuts the paper with great accuracy, folds it with corresponding accuracy; thus the bag when complete, if properly filled, will each time contain almost exactly the same amount of sugar, tea or coffee. But there are some merchants who want to sell a bag of tea, coffee or sugar for a little less than their competitors, and to enable them to do so, and yet make a profit, they arrange for a bag that will hold a little less than the so-called five or ten pound bag they have previously been using, and their neighbor is using, and by this means they are able to draw those who formerly bought of their neighbor to buy their goods, for the most of us consider it necessary to buy where we can buy the cheapest.

It seems to us that it would be just as reasonable to abandon weighing one of the commodities we have mentioned as it would the other, for, in either case, we would be putting a temptation in the way of a weaker brother by giving him an opportunity to cheat without fear of detection.

It has been said in support of buying honey by the case, that nearly all the retailers sell it by the section and not by the weight. Let us grant this to be the fact. The sections are taken out of the cases, or they are arranged in such a way that the buyer can see what he is getting, if it is sold to him as weighing a pound, and, if he doubts, he can ask to have it weighed; if the merchant refuses to do so it would be a tacit admission on his part that he was deceiving his customer. Now, there are very few merchants who would take that risk, for the reason the patronage of the customer would be worth much more to him than the little he could make on a section of honey; for how many of us would continue to trade with any one whom we found deliberately trying to cheat us?

We could cite many other reasons that to us are logical, against buying or selling honey in what seems to us a very primitive way, namely, of guessing at what the weights might be. When nowadays scales are cheap, and business is done so closely that the guess is no longer admissible, if for no other reason than the ill-feeling it is liable to arise between the parties buying and selling, it should be dispensed with.

Our purpose in the foregoing is to call the attention of bee-keepers to this subject, especially when we find that organizations of bee-keepers in some instances are advocating the abandoning of weighing their honey and selling it by the case.

Cook Co., Ill.

No. 3.—APICULTURE AS A BUSINESS.

A 200-Colony Basis Estimate—Capital Needed—No Money in the Business Except in Hands of Practical Apiarists.

BY R. C. AIKEN.

AT last W. Z. Hutchinson has come to the decision that the business that best combines with bees is more bees. He has yielded to the inevitable—to the march of specialism. We may theorize, and plan, and prospect, but to succeed and even make a respectable living from any business in these

APIARY OF E. S. MILES, OF CRAWFORD CO., IOWA.

times we must specialize. By this I mean that we must select one line of business and push that one thing. Even what a few years ago would be counted as one line of business, we find now divided into several different and special branches. One man's specialty is extracted honey, another comb, a third queen-rearing, and such division and subdivision. It is possible for one man or firm to handle successfully several lines, but to do so requires a much larger outlay of capital. The thought is, the specialist, giving his time and energy to the one thing—mastering all the details and facilitating his production or conduct of the business—is able to discount all competitors who are less well prepared. The specialist having acquired the knowledge and facilities for handling the business, adds to its volume at a very nominal additional outlay, and it is this increased volume of business handled from approximately the same basis of equipment used in the smaller business, that enables the special and extensive operators to discount the lesser.

It is the argument in favor of great combinations, that the multitude of small factories or businesses, when combined under one general head and management, can be run much more cheaply than when all run separately and independently. Combination gives power, and an unjust use of this power becomes oppression and extortion. The fact that combination gives a power that often is used for extortion, does not invalidate my argument, but strengthens it—there is no disputing the fact that in union there is strength. The general benefits of co-operation or combination I will not now discuss, nor the wrong use of power, which comes of combination; I have introduced the thought here because specialization and combination are things that must be considered in our business calculations. My aim in this series of articles on "Apiculture as a Business" is to get our ideas down to a business basis. The thing most of all that has prompted this discussion, is the fact that there is an epidemic bee-fever in Colorado, and very many are rushing into the business, apparently only to make financial failures.

I am going to take the proposition of one going into apiculture as a money-making procedure, calculating cost of equipment and all necessary expenditures, and analyzing the business in its details to the final outcome. This will include a consideration of locality, market conditions, ability of apiarist, and methods to obtain results.

One of the very first and most common mistakes made by all classes, is a failure to consider the cost, final chances of success, and, whether there is room and opportunity for their proposed venture. Suppose some one has a longing to embark in the business in my territory here. He thinks I am making money, and surely he is as smart as I am—if Aikin can succeed so can he. He does not stop to think that I am already established in the business, that I have spent years of study and hundreds and hundreds of dollars in investigations, experiments and advertising, have built up a trade—in short, have spent years laying the foundation for a business. Few stop to consider that it is not a question simply of mere personal fitness, but of preparation and becoming fitted by practice and familiarity with the thing we are to deal with.

I note that many of these investors are paying \$5 a colony for their stock to start with. They, being no judges of the condition of the stock, get good, bad and indifferent, various-sized hives, ill-fitting supers, queenless colonies, foul stock—many undesirable things. In order to have a basis I shall

take the \$5-a-colony price, considering that this price gets regular hives and two supers to the hive. I shall also consider that 200 colonies will be all the prospective apiarist can handle, and that some experience has been had to enable the owner to begin with a fair foundation knowledge of the management of bees.

The 200 colonies at \$5 is \$1000; honey and storage-room (small \$100; smokers, knives, veils, cart or barrow, solar or other wax-extractor, saws, hammers and tools to make or repair hives, etc., \$25; total investment, \$1120.

A 25-pound yield from the 200 colonies would give 5000 pounds—but suppose a 50 pound crop—10,000 pounds. According to a former estimate (see article No. 2) 10,000 pounds costs in foundation, sections, and cases, \$200. The bees assessed at \$1 a colony and at a general total tax of 2½ percent, is \$5—a total outlay of cash for the 10,000 pounds of honey, \$205. At the average price noted in article No. 2, this crop of honey being 416 cases and a fraction (we will drop the fraction) brings \$915.20. Take from this the \$205, cash paid, and \$710.20 remains to pay interest on the investment and for the apiarist's labor and living.

Now let us run the calculations through on an average yield of half the foregoing. We have 208 cases at \$2.20—\$457.60; taking from this \$105 for sections, foundation, cases and taxes, leaves for the labor and interest \$352.60. A glance at these figures shows at once that if the owner can not handle the stock himself and alone, if for any reason he has to have hired help, very little will be left of the income.

But I know many will say, "What of the increase? That is worth something." Let us see what it is worth. A fair increase for 200 colonies would be 100, when handled at all with a view to getting the surplus yields I have allowed in the foregoing estimates. 100 new hives, two supers each, will cost in the flat about \$1.50 each; nailed and painted, with starters in the brood-frames, the apiarist doing the labor, the hives cost about \$2.00 each. I allowed at the start \$5 a colony for the stock purchased to begin with, but it would not be a safe price on the increase. There is a limit to all things. You do not expect to go on increasing and selling your increase to your neighbors to go into business and be your competitors; and not only competitors, but to overstock your pasturage and cut down your yields. Even if you did expect to sell the increase there would soon be no market for it—you could not continue that line of policy very long. I should say that \$3 a colony would be a good, big allowance for the increase.

So far, we have gone on the assumption that the original stock remains intact, no losses in winter from queenlessness or any other cause. A small annual increase is necessary to make up for the unavoidable losses; it is a rare thing to get through the winter without a few losses from queenless colonies at least. This necessitates, then, some additional capital invested in hives. If we must, in order to keep up the stock, have some extra hives for increase, our capital put into the business is greater than the \$1120, given at the start. To have a really safe basis to keep up the original stock, one should have about 25 extra hives, making so much increase in them to be doubled back or substituted for the unavoidable losses.

There is still another item not yet considered. No matter whether the yield be 5,000 or 10,000 pounds, there will be of necessity a surplus of sections and foundation, for one can not time to an exact count. The unfinished sections left over when you have cleaned up 5,000 pounds of marketable honey or any other amount, will be from 10 to 20 percent, sometimes reaching 40 or 50 percent. This represents only the sections used or placed on the hives, while there must, of necessity, be an additional stock carried in order to have enough. If we anticipate a 10,000-pound yield, we can scarcely do less than buy and put up at least 10,000 sections, even though we do not get half of them filled. And, if one expects to do the work and care for the stock himself, it becomes a necessity that all prospectively needed hives, sections, and all supplies except cases, be purchased ahead and prepared, enough to hold the biggest crop expected, for 200 colonies will keep one hand bustling during the honey-flow.

These extra supplies needed and carried in stock, must be added to the investment of bees, honey-house and tools. Two hundred colonies in one apiary are too many—they should be in two places. If in two yards, a horse and wagon will be needed. Without any more itemizing I am going to put the necessary money capital to be invested in a 200-colony business where \$5 a colony has to be paid for the bees, at \$1500. Ordinarily it is not done for less.

In the foregoing estimates I have put the figure much higher than any green hand could accomplish. I have taken it for granted that all the product was No. 1 honey, whereas

the inexperienced would have from $\frac{1}{2}$ to $\frac{2}{3}$ No. 2 and culls. For the past ten years I put my own general average at 40 pounds. My general average price has been, for all grades, about \$2 a case—8 $\frac{1}{2}$ cents a pound. Sections, foundation and cases cost 2 cents, or 80 cents a colony. Investment for 200 colonies and equipment being, as per previous tables, \$1,500, I allow on this 10 percent for interest, and 10 percent more for wear and tear—20 percent of \$1,500 is \$500, or \$1.50 a colony. A 40-pound yield at 8 $\frac{1}{2}$ cents makes the gross income per colony \$3.33. Deduct from this the cost of sections, foundation and cases, interest and wear and tear—the 20 percent on capital invested—\$2.30 a colony, leaves me \$1.03 a colony. 200 colonies giving me the sum of \$206 for my labor and caring for them.

If this is the way it turns out with one of so large an experience, what must be the result when an inexperienced person is doing the managing? There is no money in the business here except in the hands of practical apiarists.

SELLING EXTRACTED HONEY IN PAPER SACKS.

So she thought a gallon crock went with three pounds of honey, and ineffectually packed it full of butter! All right to deliver her honey in a paper sack, if you tell her to pour it out into something else directly. And the actual storage in flour-sacks of 1,000 pounds of honey, taken from badly leaking (and badly warranted) barrels is certainly worth putting in the papers. They were second-hand flour-sacks at that, remember. Page 631.

MIXING OF SWARMS.

Boomer's experience, on page 633, touches one of the standing bee-puzzles. When two swarms mix, some think it well and some think it ill, but whatever happens, they seldom separate. Yet when a swarm forces itself into another hive they usually separate. Why is this? I rather think that in the latter case they don't really mix, but stand with their toes on a line making faces at each other. The case Boomer gives is a little unusual as to the short time No. 1 had been in possession.

FLORAL DISPLAYS ON HIVE-TOPS.

Looking at the very beautiful apiary of J. W. Tucker & Son, on page 634, I see pots of flowers on some of the hive-roofs. That's not new, but the contemplation of it pops a new thought into my mind. Could we put a "Wandering Jew," or some equally rampant vine, into a big pot and make it weigh down the cover and shade the whole establishment at the same time? I see some objections, but maybe they could all be surmounted. They wouldn't blow away as easily as tall plants do.

GROWING MULBERRIES FROM THE SEED.

Considering how shy of germination many similar seeds are, it is quite a success to have mulberry seeds sown August 15, not only up but an inch high September 20. Little excuse left now for not having all the young plants we think we need. Page 637.

BOUNTIFUL CROP REPORTS HELP SALES.

Quite interesting to see so competent authority as R. A. Burnett & Co. adopt the opinion that the cry of "Honey scarce and high this year" scares off customers; and that the publication of news that there has been a bountiful crop promotes sales. This is not a popular view with our brethren; but it's well for them to remember that there is such a view. Of course, yarns about an enormous overplus would not come under the same head. I fear there are usually quite as many trying to lie the crop down as try to lie it up. What does a liar estimate himself at, anyhow? Manifestly one Ananias. Liar is more than a match for a dozen Ananias. Bear, Esq. The latter can not possibly see any less than none in any given locality. If there are five ear-loads somewhere, then five ear-loads is the limit of his mendacity; while the former chap has no limit, and can see five ear-loads as a thousand. Better we make it hot for the whole Ananias tribe. Page 643.

HONEY-BEES AND TEXAS CATTLE.

Adrian Getaz says an important but rather discouraging thing on page 647. Can we by skilled breeding make Texas cattle more tough and hardy than they are? Probably not. Nature has already done the job and finished it. Well, then, how about bees? Has not nature for thousands of years been developing hardiness and honey-gathering, the very qualities we propose to breed for?

A WOODPECKER'S "BEE."

Thanks to Prof. Cook for his verification of "bees" among woodpeckers—bees not at all zoological, but industrial. It's pleasant to see how many human things we can find duplicated among our lower down (in this case higher up) relations. So the woodpecker does sometimes actually "make a bee" and invite his fellows to help him—and they good-naturally respond, and pick away for awhile, and then go back to their own work. Page 649.

EVENING PRIMROSES AS NECTAR YIELDERS.

How mysterious are the kinds of honey-flow and seasons! Why did the evening primroses this year abound with nectar—both in Missouri (page 652) and here in Ohio—notwithstanding the fact that they usually do not attract bees very much. Prize of five cents for the boy that can tell.

* The Home Circle. *

Conducted by Prof. A. J. Cook, Claremont, Calif.

INDULGENCE.

The greatest lesson Christ taught the world was the blessedness of sacrifice. "He came not to be ministered unto, but to minister." "My father worketh hitherto, and I work." "He that saveth his life shall lose it, but he that loseth his life for my sake and the gospel's shall surely find it." He was not simply willing, but rejoiced to give himself for men. No wonder his most devoted, and so, of course, his most efficient disciple—the great Paul—could say, "I count not myself dear unto myself." No wonder he could rejoice in beatings, shipwrecks, standing the hardest trials and most burdensome sacrifices. He had right in sight the greater sacrifices of the Master, "who spake as never man spake," who "went about doing good," and in "whose life was no guile."

The dear Christ life and nature knew no such word as selfishness, but were guided and gilded by sacrifice. "No wonder He lifted the world. No wonder He shines in lives and hearts today. No wonder that He is to work as most blessed leaven until the world is redeemed unto himself."

I believe that this greatest lesson is one that we keep too little in mind in our home circles. We as parents love our children. We love to gratify them. To minister unto them is easiest, for our greatest pleasure comes when they are happiest. Our love, unless we are wary, will trample our judgment under foot, and will hide the teachings, the life, the incomparable example of the Christ standing as a wall between them and their application to our children. To be served, petted, indulged, often clothes a child with the murky garment of selfishness. To serve, to be buffeted for faults, "to work out one's own salvation with fear and trembling," all these go to make character, and develop within the boy or girl a moral and intellectual physique and stamina that will stand alone if cruel circumstances remove all the props which kindly hands so fondly place and hold in position.

I have seen many a boy, and many girls, made pulpy, inefficient, and, worst of all, irredeemably selfish, by just such indulgence. The finest characters I have ever known have been those who have been strengthened in fiber and gripe by entire self-dependence and self-support in all their college life. Such persons can appreciate Christ's rugged philosophy, and, if occasion requires, can rival Paul in battling against hardships and calamity.

My mother was very indulgent. I think she enjoyed that I lay hat, coat or books on chair or sofa that she might have the joy of putting them in place, or waiting on me. My first room-mate in college had not been so treated. He was older than I, and I justly looked up to him with great admiration and respect. He could not have done a kinder thing to me than he did do. He taught me right at the threshold of our

most happy, blessed and helpful association that I was to put up my nights in and every time. Out on a chair; not much. Hat or books on his table; certainly not the second time. Boots anywhere rather than close side by side in touch with bed-leg just under the bed, as I retired; well, if so not repeated. What if it did seem a little tough then? What if it did make me dream of home and mother? It was a most valuable and much-needed lesson.

Mother marvels when I came home on vacations, at the valuable influence of college to make students more orderly and thoughtful. She did not know until I told her years after that it was my room-mate, Prof. Prentiss—long the honored Professor of Botany in Cornell University—that wrought the reform. To-day he is with God, beyond the river, but his salutary influence is still on earth, and it did much for me.

I know a mother who was left a widow with four children and a large debt. She had been a teacher; indeed, it was she that first said "college" to me, and with a look and emphasis that made me resolve that it and its invaluable gifts should be mine. She was determined that all those children should have a college education. Through indomitable energy and courage, by dint of long, hard hours of severest labor, she lifted the debts, gained a competency, and sent all her children to college. She felt that they must not have the hard life that she had suffered. She sent money to them in handfuls. One of her boys was dubbed "Vanderbilt." This was before her debt burdens were lifted, and in spite of the fact that the boy knew of his mother's trials and hardships. I begged of her to withhold the money, but she was deaf to my suggestions. The two older boys were almost ruined. They are now pretty successful and valuable men, but it took years, and much more of the mother's money, to undo the mischief.

My father gave me to know that possibly he could not afford means to send me through college. "It would depend upon the expense," He also said something about my record. He need not have done this, as I was just athirst for what the

college could give me. As a result, I earned enough while in college more than to pay half my way, though I was far from strong. Whatever I may have thought then, I now am sure that my father was very wise. No father, I ween, can do a wiser thing than to inculcate in his child a love for work, passion for industry, and habit of economy of both time and money. Indulgence will never grow the kind of fiber that gives us our grandest men and women. A wise requirement of work, duties regularly, faithfully and promptly done, will secure noble men, and such requirement is the best heritage that any son gets from wise and loving parents.

THRIFT.

Can a father give a son wise advice than that he save each year a part of his income? I know far more than one man who spends each year the entire amount of his earnings. I know of more than one whose expenses exceed the income. This course, if a man is rightly endowed with proper sensibilities, will handicap his daily efforts, as with such loss of independence comes unrest, and discontent weighs down efficiency.

No father can do a wiser thing than to furnish a son or daughter with opportunity to earn money, and then watch for every opportunity to beget a love and habit of wise saving.

LOVE OF PARENTS.

The fifth, or pivotal, commandment of all the ten, is "Honor thy father and thy mother." If Joseph, after his great honors and opportunities came to him, could have gone to see that old, loving father; or, if there did not seem insuperable objections to his going, then he was a bad, ungrateful son. If, on the other hand, his heart yearned to go, and he denied himself the great pleasure, feeling that possibly family discord and greater ill-will and discontent would follow such visit, made before due preparation prepared father, and especially brothers, for it, then he was truly a grand boy. In industry, purity, kindness, and generous magnanimity, he was certainly a model for all the ages.

Langstroth on... The Honey-Bee

Revised by Dadant—1900 Edition.

This is one of the standard books on bee-culture, and ought to be in the library of every bee-keeper. It is bound substantially in cloth, and contains over 500 pages, being revised by those large, practical bee-keepers, so well-known to all the readers of the American Bee Journal—Chas. Dadant & Son. Each subject is clearly and thoroughly explained, so that by following the instructions of this book one cannot fail to be wonderfully helped on the way to success with bees.

The book we mail for \$1.25, or club it with the American Bee Journal for one year—both for \$1.75; or, we will mail it as a premium for sending us THREE NEW subscribers to the Bee Journal for one year, with \$3.00.

This is a splendid chance to get a grand bee-book for a very little money or work.

A War Veteran's Report.

I am an old veteran soldier of the Civil War of 1861-1865, serving three years and eight months in Company H, First Michigan Light Artillery. I was injured in the service, having taken part in 15 battles, and now draw a pension. I have kept bees and farmed ever since. I have a small farm and grow fruit and general produce. I had four colonies of Italian and hybrid bees, spring count, which increased to 11 and yielded 80 quarts of extracted and 60 pounds of comb honey. I have had a Novice extractor for 10 years, but have not used it much, as I reduce the number of my colonies to about 10 or 12, as I have no time to attend to more. I generally sulphur that number every fall, and use the combs thus obtained to extract from the following season.

This has been the best honey season in years in this vicinity. I have been sowing sweet clover in waste, out-of-the-way places of late years, and have gathered a lot of it this fall, and also cut up seed, to sow early in the spring of 1902. It yields lots of honey and bees work on it a month. I use 8-frame double-wall and 10-frame single-wall Simplicity hives.

Oakland Co., Mich., Oct. 30.

Safe Introduction of Queens.

So much has been written on introducing queens, and so much dissatisfaction and so many failures, that I am hereby induced to give my plan, which, up to the present, has not failed in a single instance, and it would be hard for me to believe that any one would fail who adopts my method and strictly carries it out. If it is a queen received through the mails, I follow instructions on the package, and I have never lost a queen by that plan, unless there happened to be two queens in the hive—not thinking that the old mother

and her daughter were together. In that case I lose the imported queen. Now for my never-failing plan:

First, I have a wire-cloth tent that sets over the hive, with room for me to work under. I take the smoker, and make the bees fill themselves with honey by rapping on the hive, etc., and in five to ten minutes I open the hive and take out each frame until I find and kill the old queen; and as I take out the frames I set each one outside of the hive in a box the size of the hive, with a bottom-board attached. I then shake all the bees from each frame to the ground directly in front of the hive, with alighting-board removed, and then replace each frame in the hive.

I understand, the old queen is now dead, the bees are all on the ground, and the frames back in the hive.

I now replace the alighting-board, and they immediately start to crawl in; after about 1-4 or 1-5 of them have crawled in, I take the queen I wish to introduce and drop her in a cup of extracted honey, take her out and drop her on the alighting-board near the entrance. I then close the hive (if I failed to do so sooner), raise a side of the tent and get out, leaving the tent over them until they are quiet.

I have introduced in this way at all seasons of the year, from April to October, and have yet to lose the first queen, and I have introduced hundreds in this manner. I can guarantee safe introduction in every case where the instructions are strictly carried out. If bees are thoroughly filled with honey, and enough smoke used to keep away provokers, you can introduce a laying queen at any time, and I have not yet failed in introducing virgin queens in this manner. T. J. BAXTER.

Craven Co., N. C.

Poorest Honey Season in 15.

I have kept bees for about 15 years, and this has been the poorest season for honey in this locality I have ever experienced. People out West seem to think honey-dew is no good, but we think it is strictly first-class, and are always glad to see it come. Three cheers for Prof. Cook's article on patent medicines, on page 698. Hit 'em again, Prof. Cook.

Scott Co., Va., Nov. 2.

Spring Dwindling and Its Cause.

I have not been in the bee-business long, and can not compare with those great big fellows at the Buffalo convention. It seems that the bee-keepers all fear spring dwindling, and that was one of the first subjects discussed by that worthy body. My experience has been, that with proper food and all tucked up snug and warm, yet one thing lacketh here in southern Ohio. It seems as if winter and summer have this section for their battle-ground—first one victorious and then the other. Bees generally can find pollen by March 20, about which time a few warm days swell the maple-buds, when the bees rush forth, and, of course, commence brood-rearing. This condition lasts long enough to stimulate brood-rearing, when, unexpectedly, old Winter makes a charge from the northwest and drives the mercury down to 10 degrees below the freezing point, holding this position for from three to six days. The bees remain quiet for a day or two, or until the supply of water in the hive is exhausted, and the brood is ready to die for want of it; then the little martyrs go forth, rain or snow, and never return, and there you have a genuine case of spring dwindling in the strongest, well-packed and provisioned colonies, none exempt.

I passed through just such an experience last March, and again in April, yet I lost no bees, though some of my neighbors did. I looked out one evening in March, when the snow was eight inches deep, and still falling, and I saw a sight that almost took my breath—thousands of bees flying, so it seemed to me. I rushed out to find the snow covered with them. I closed the entrances of the hives, and in five minutes they came up from the hives and boxes I had them parked

Great Combination Subscription Offers.

Combination and concentration in business are the magic watchwords of the age in which we live. Why should it not be applied to the matter of subscriptions to magazines and periodical literature in general? We believe it is a wise move, especially when it is in the line of economy for the reading public. Now, if we can be the means of saving our subscribers several dollars a year on their reading matter, and at the same time help them to the best literature published to-day, we shall feel that we are doing a good thing, indeed.

We have entered into an arrangement whereby we can furnish the following excellent periodicals at greatly reduced prices:

Regular price.	THE DOLLAR PAPERS.	Regular price.
Review of Reviews	Cosmopolitan Magazine	1.00
Current Literature	Frank Leslie's Popular Monthly	1.00
New England Magazine	The Household	1.00
Leslie's Weekly	Good Housekeeping	1.00
North American Review	The Designer	1.00
	Success	1.00

PLEASE NOTICE that in all combinations Success and the American Bee Journal must be included.

Here is our List of Liberal Offers:

American Bee Journal and Success, \$1.75.

with any one of the above dollar magazines (3 periodicals)	\$2.50
with any two of the above dollar magazines	3.00
with any three of the above dollar magazines	3.50
with the Review of Reviews (new)	3.00
with Current Literature (new)	3.00
with New England Magazine	3.50
with Review of Reviews (new) and any one of the dollar magazines	3.50
with Leslie's Weekly	3.75
with Review of Reviews (new) and Leslie's Weekly	4.75
with North American Review (new) and Review of Reviews (new)	5.00

If a renewal subscription is wanted for the Review of Reviews, Current Literature, or the North American Review, add \$1.00 for each renewal subscription to the combination prices named above. On all the other combinations a renewal costs the same as a new subscription.

No foreign subscribers can take advantage of these combination offers.

We shall be pleased to have our readers examine carefully the above list, and send us their subscriptions. Address.

Extracted Honey For Sale

ALL IN 60-POUND TIN CANS.

Alfalfa Honey

This is the famous White Extracted Honey gathered in the great Alfalfa regions of the Central West. It is a splendid honey, and nearly everybody who cares to eat honey at all can't get enough of the Alfalfa extracted.

Basswood Honey

This is the well-known light-colored honey gathered from the rich, nectar-laden basswood blossoms. It has a stronger flavor than Alfalfa, and is preferred by those who like a distinct flavor in their honey.

Prices of Alfalfa or Basswood Honey:

A sample of either, by mail, 10 cents, to pay for package and postage. By freight—two 60-pound cans of Alfalfa, 8 cents per pound; four or more cans, 7½ cents per pound. Basswood Honey, ½ cent more per pound than Alfalfa prices. Cash must accompany each order. You can order half of each kind of honey, if you so desire. The cans are boxed. This is all

ABSOLUTELY PURE HONEY

The finest of their kinds produced in this country.

Read Dr. Miller's Testimony on Alfalfa Honey:

I've just sampled the honey you sent, and it's prime. Thank you. I feel that I'm something of a heretic, to sell several thousand pounds of honey of my own production and then buy honey of you for my own use. But however loyal one ought to be to the honey of his own region, there's no denying the fact that for use in any kind of hot drink, where one prefers the more wholesome honey to sugar, the very excellent quality of alfalfa honey I have received from you is better suited than the honeys of more marked flavor, according to my taste.

McIlenny Co., Ill.

C. C. MILLER.

Order the Above Honey and then Sell It.

We would suggest that those bee-keepers who do not produce enough honey for their home demand this year, just order some of the above, and sell it. And others, who want to earn some money, can get this honey and work up a demand for it almost anywhere.

GEORGE W. YORK & CO., 144 & 146 Erie St., Chicago, Ill.

in, and if ever a fellow felt helpless it was I. Noticing the bees sucking the snow about the entrances, I took the hint and made a rush for the teakettle. I tempered some water and put it at the entrances; those poor bees just covered the entrances, crawling over each other to get that water. In less than 20 minutes all were quiet. The weather remained cold for several days, but I lost no more bees. Mr. Root may safely say it is not a disease, but a condition, namely, young bees to care for, and water, one of the great requirements, not available. If you have prepared your bees properly, both as to food and shelter, yet under the conditions I have mentioned you will have a fatal case of spring dwindling. Therefore, the preventive would be plenty of stores—both of honey and water. Pike Co., Ohio, Nov. 4. J. M. WEST.

Hand-Picking Drones.

On page 681, Mr. Doolittle tells about having hand-picked drones for best results. "Killing all winter, you think are not such as you would desire." It may be an easy thing for Mr. Doolittle to decide just what are the best drones, but a very hard thing for a novice. Please have Mr. Doolittle inform us how we are to decide which drones to kill and which to save. LEARNER.

[In hand-picking drones I look first for perfect development, and those under size and imperfect in any way are killed. Next I look to activity on the combs, believing those sluggish in action and motion while on the combs will be the same while on the wing, and beget offspring of like import. Next I look at their markings, and any varying to an unusual degree to either side of an average are disposed of. It would seem hardly necessary for me to say in conclusion, though some beginners may not know it, that drones are what are known as "commoners," which means that not colony which will keep their own drones will allow the drones from other hives in the apiary to enter and be welcome. And thus it often happens that when drones from other colonies are being driven out, they will enter the colony having the drones from our select, drone-reared queen; and, in hand-picking, these should be selected and killed. This can generally be done from their color or markings.—G. M. DOOLITTLE.]

A Successful Wintering of Bees.

This has been a very poor season for bees in my locality. We had so much rain and cold winds in the spring that the bees could work but little on apple-bloom, and when that was over it kept right on raining, so that farmers could not get in many spring crops; so the summer has been a poor one for the farmer as well as the bee-keeper. I sold all but about 100 colonies last spring. I increased them to 178 during the season, but got very little honey—perhaps 450 or 500 pounds—nearly all from alsike clover. It rained so much that buckwheat did not yield any honey to speak of, and it has been the poorest season of the 12 that I have kept bees. I was making things over very badly when I had kept a record of my bees, of which the following is that of the past four years: Dec. 2, 1897, I put 190 colonies into winter quarters, and on March 23, 1898, took out 189, losing one by smothering. Dec. 1, 1898, I put 204 colonies into winter quarters just as they were, with no feeding or anything. And April 7, 1899, took out 203, losing 1 colony by starvation, and two by dwindling down to a handful each. I again sold all but about 90 colonies; and on Nov. 25, 1899, I put 120 colonies into a bee-house, taking out, April 7, 1900, the same number, with no loss. Nov. 17, 1900, I prepared 100 colonies for winter, all having enough stores for winter; and on April 19, 1901, I took out 130 colonies, one having played out through loss of the queen. I sold again, and doubled up to about 100 colonies.

Now, if any one who winters his bees above the ground, can show a better record than mine, I would like to hear from him. I have read the American Bee Journal for several years, but do not remember seeing any mention of our best bee-keepers making a success

wintering their bees above ground. My bees were not prepared as Mr. McEvoy explained to us at the Buffalo convention they were simply put in the bee-house with a full hive of frames and honey, and tiered four high.

ANDREW M. THOMPSON.

Allegheny Co., N. Y., Nov. 3.

Bees "Away Up North."

Last fall we had three fine colonies of bees, filling two stories each, but the winter proved too much for them. We had 3 1/2 months of continued cold weather, there being scarcely a day when they could leave their hives for a flight, so when we opened them it was to find them all dead except a handful on the top of hive No. 2, which we put into a new one and made them cozy. We did not think it of any use to give them a queen until July 6; they looked as if they meant to stay, not losing a single bee. I was sorry we lost so much time, but got a queen introduced; two days later I put a hole through the candy in the cage with an awl, and waited three weeks, when I found the queen still a prisoner. I opened the cage and let her down with her attendants, and to all appearances all were thankfully received. It was interesting to see those old bees renewing their youth and guarding their hive with such an air of importance when the few yellow babies came out for their first play-swirl—those bees must have been about 10 months old. I wonder where they have gone. I would have given them a decent funeral had they not taken themselves away; but I think they died happy, and I am not at all sorry that this year has been a failure, as I have had some needed lessons and much enjoyment.

I am as much interested in the bees as ever, although I am not beyond the one precious colony. I am as fond of the American Bee Journal as I am of the bees, and I do not wish to do without either.

TOM HENRY.

Muskoka, Ont., Canada, Nov. 5.

Workers Decide as to Brood-Rearing.

A good deal of previous observation, and closer observation this fall, lead me to believe that the *rule* is that queens continue laying for a time after workers cease rearing brood in the fall. At least, it is a very common thing to find eggs and sealed brood present, but no unsealed brood.—A Stray Straw in Gleanings in Bee Culture.

Deep vs. Shallow Brood-Frames.

For a long time I have been on the fence—undecided which to choose. Each seemed to possess some advantages. I did not want to give up, so I kept using half-stories and full stories, shallow and deep (11 inches) frames in equal numbers. I can get along very well in my home yard with the shallow hives; but when it comes to outyards, give me deep-frame hives, any time. In stocking up an outyard I was obliged to make out the desired number partly with half-story hives. I anticipated difficulties at the time, and I found them when it came to managing the hives. When two or more sectional hives are used as colonies, the combs or frames of the upper section will generally be more or less fastened to the lower one by bits, or to make otherwise, making it unpleasant to separate the two; then it requires so much more handling of frames to get through a hive just when time is most valuable that it almost seems like wasting it. When using only one shallow chamber as a hive, the bees have a way of boiling over as soon as opened up, which is very annoying.

I used to think that the shallow frame would be very nice for nuclei; but after trying it for years by the side of deep frames, it does not suit me nearly as well as the latter. I can find queens much quicker on a deep

A NIGHT EXPRESS TRAIN ON THE NICKEL PLATE ROAD.

A change of schedule for departure of train No. 6 from Chicago on the Nickel Plate Road, provides a convenient express train for Ft. Wayne, Findlay, Fostoria, Cleveland, Erie, Dunkirk, Buffalo, New York City, Boston, and all points East, leaving Chicago daily at 11:20 p.m., reaching New York City 6:50 second morning, Boston 10:07 second morning, and all other points east of Buffalo on same time as heretofore. Sleeping-car open for reception of passengers to retire at their convenience, after 9:30 p.m.

Daily train from Chicago at 10:30 a.m. reaches New York City following afternoon at 3:30 o'clock, Boston 5:20. Daily train from Chicago at 2:30 p.m., reaches New York at 7:35 p.m., next day. Through vestibuled sleeping-car. Meals served in Nickel Plate dining-cars, on Individual Club meal plan, ranging in price from 35 cents to \$1.00. No excess fares on any train of the Nickel Plate Road.

Chicago depot, Van Buren St. and Pacific Ave., on the Elevated Loop. For further information, write John Y. Calahan, General Agent, 111 Adams St., Chicago.

44-48Alt

frame, because they are not so apt to hide in the space between the lower edge of the brood-comb and the bottom-bar of the frame. Particularly is this so with black bees, as they are inclined to run off the comb and take the queen with them. When taking a deep frame out of a hive the bees have not time enough to run off, while with a shallow one they would. I have decided to decrease my shallow-frame colonies gradually, and change back to the deep frame.—F. GREINER, in *Gleanings in Bee Culture*.

Raising Hives from the Ground.

Placing hives on high stands is in most places a thing of the past, and it is probable that most bee-keepers would say that there is no sufficient reason for the practice in any case. Arthur C. Miller, however, in the *American Bee-keeper*, seems to think there are many places where it is not advisable to set hives near the ground, and he gives a reason for his view. He says:

In my home-apiry all hives are placed close to the ground; but in a small one, half a mile away, they are all on a bench some two feet above the ground. Both apiaries are stocked with the same strains of bees and part of the home-apiry is worked on the same system as the outyard. In the latter I have no trouble in getting comb honey, but in the home yard it is difficult and almost impossible. The production of extracted honey is also affected, but not so markedly. So far as I have been able to determine, the difference is due entirely to the elevation of the hives.

In another small apiary (six colonies) the owner has two hives about 18 inches above ground, the rest on it. The two have done fine, the others poorly. In my own case this experience has extended over several years. In the vicinity of my apiaries at night a strata of cold fog is often observed close to the ground, and I surmise that this is the cause of my home yard doing less well than the outyard, the hives of which are above the cold, damp strata of air.

In another district where I have had a trial colony to test its resources, periods of honey-flow, etc., I found that the hill-sides were free from a fog, while the low lands were blanketed with it about every night. Though this latter location is 50 miles from my home apiary, it would hardly be wise for one to say that because the conditions are alike in such widely separated spots, they must be everywhere; and in no locality should hives be placed on the ground unless on the hill-sides well up from the low lands.

Two-Frame vs. Four-Frame Extractors.

An editorial in *Gleanings in Bee Culture* may help to settle in the minds of those having a comparatively small number of colonies that they would not be greatly better off with a four-frame extractor. It says:

Opinions seem to be about equally divided between a two-frame extractor and a four- and six-frame machine. The advocates of the first-named will claim every time that they can extract just as much honey, and do it easier; while those who talk in favor of the big machines say they can not afford to fuss with the little ones. I did some extracting while in California, or at least I helped. My own opinion is that a six-frame machine is too large for one man to turn comfortably. Even a four-frame extractor is large enough. I came home with the conviction firmly rooted in my mind that these large machines ought to be run by some cheap gasoline power, of a half or a third horse-power in size. In the course of a month or six weeks, I think, we shall have something that will run these big machines, and actually save the time of a big, strong man. Labor in California is rather expensive, and the cost of maintaining a little gasoline-engine during the honey season would not exceed two cents a day while being operated. Contrast this with the expense of a strong man, and figure out how much would

No. 4 "Barlier Ideal" Oil-Heater.

The "Barlier Ideal" OIL-HEATER

Saves Its Cost Every Year!
NO ODOR! NO SMOKE! NO ASHES!

Costs only a cent an hour to run it.

The editor of the *American Bee Journal* is using the "Barlier Ideal" Oil Heater, and it is all right in every way. We liked it so well that we wanted our readers to have it too, so we have recently arranged with its manufacturers to fill our orders. The picture shown herewith is the one we recommend for general use. It is a perfect gen of a stove for heating dining-rooms, bed-rooms, and bath-rooms. It hinges back in a substantial way, and is thoroly well made thruout. The urn removes for heating water. The brass fount, or well, has a ball, and holds nearly one gallon of kerosene oil. It is just as safe as an ordinary lamp. You wouldn't be without it for twice its cost, after once having one of these stoves. Most oil-stoves emit an offensive odor, but this one doesn't. Its light is 2½ feet, and weighs 20 pounds, or 20 pounds crated ready for shipment, either by freight or express.

Price, f.o.b. Chicago, \$6.00; or, combined with a year's subscription to the *American Bee Journal*—both for only \$6.50. FULL DIRECTIONS GO WITH EACH STOVE.

If you want something that is really serviceable, reliable, and thoroly comfortable, you should get this "Barlier Ideal" Oil Stove, as it can easily be carried by any woman from one room to another, and thus have all the heat you wish right where you want it.

The Novelty Pocket-Knife.

Your Name and Address on one side—Three Bees on the other side.

(THIS CUT IS THE FULL SIZE OF THE KNIFE.)

Your Name on the Knife.—When ordering, be sure to say just what name and address you wish put on the Knife.

The Novelty Knife is indeed a novelty. The novelty lies in the handle. It is made beautifully of indestructible celluloid, which is as transparent as glass. Underneath the celluloid, on one side of the handle is placed the name and residence of the subscriber, and on the other side pictures of a Queen, Drone, and Worker, as shown here.

The Material entering into this celebrated knife is of the very best quality; the blades are hand-forged out of the very finest English razor-steel, and we warrant every blade. The bolsters are made of German silver, and will never rust or corrode. The rivets are hardened German silver wire; the linings are plate brass; the back springs of Sheffield spring-steel, and the finish of the handle as described above. It will last a last-time, with proper usage.

Why Own the Novelty Knife? In case a good knife is lost, the chances are the owner will never recover it; but if the "Novelty" is lost, having name and address of owner, the finder will return it; otherwise to try to destroy the name and address, would destroy the knife. If traveling, and you meet with a serious accident, and are so fortunate as to have one of the "Novelties," your POCKET KNIFE will serve as an identifier; and in case of death, your relatives will at once be notified of the accident.

How appropriate this knife is for a present! What more lasting memento could a mother give to a son, a wife to a husband, a sister to a brother, or a lady to a gentleman, the knife having the name of the recipient on one side?

The accompanying cut gives a faint idea, but cannot fully convey an exact representation of this beautiful knife, as the "Novelty" must be seen to be appreciated.

How to Get This Valuable Knife.—We send it postpaid for \$1.25, or give it as a Premium to the one sending us THREE NEW SUBSCRIBERS to the *Bee Journal* (with \$3.00). We will club the Novelty Knife and the *Bee Journal* for one year, both for \$1.00.

GEORGE W. YORK & CO.

St., Chicago, Ill.

Please allow about two weeks for your knife order to be filled.

be saved. Of course, a man can do something besides turn the extractor; but with a little power, he can make his own labor go twice as far, and at the same time do the work more thoroughly.

Drones of a Drone-Layer All Right.

"Are the drones from a queen who has never met a drone virile?" is a question suggested by the editor, p. 778. Dzierzon holds that they are. On p. 244 of the American Bee Journal, Vol. 1, the Baron of Berlepsch gives a *posterior* proof that is almost conclusive. On p. 246 of the same volume is given the testimony of no less an authority than Prof. Leuckart, which, I think, settles the question. He says: "Those originating from the eggs of unfecundated or drone-producing queens are, as I have ascertained, as perfectly developed and as fully virile as others. So, likewise, are those dwarf or diminutive drones, which are occasionally bred in royal-cells. Nay, even in a drone hatched in a worker-cell, though prematurely dead, sent to me by Mr. Kleine, I have unquestionably found seminal filaments and male organs. The case is precisely similar also with drones hatched from eggs laid by laying workers. Mr. Vogel, inserted in a hive of common bees a drone-comb containing eggs laid by an Italian worker (which he had seen laying in a queenless colony), and removed the colony to an isolated locality. Italian drones were hatched, and two common queens, fecundated while the drones were dying, producing partly common and partly Italian workers. There were then no other Italian drones in that neighborhood, those queens must have been fertilized by drones produced from the eggs of the laying worker."—[This ought to be sufficient proof.—Ed.]—[Gleanings in Bee Culture.

CONVENTION NOTICES.

New York.—There will be a bee-keepers' convention (annual) held in Canandaigua, N. Y., by the Ontario Co. N. Y., Bee-Keepers' Association, Dec. 13 and 14, 1901.
Naples, N. Y. FRIEDMANN GREINER, Sec.

Michigan.—The Michigan State Bee-Keepers' Association will meet in convention at Petoskey, Jan. 1 and 2, 1902. This promises to be the most largely attended meeting of the Association in years. You are invited to attend. Reduced rates on all railroads; tickets can be bought Dec. 30 and Jan. 1, good to return not later than Jan. 4. There will be no set program, but another of our "open corner" meetings. Those who have attended in the past know what that means, and those that don't should come and find out. A model design for badge has been ordered in honor of "Petoskey."
Geo. E. HILTON, Pres.

"SUCCESS." A WINNER.—One of the foremost editors of New York announced, a few months ago, that the only magazine that would win would be the magazine with a backbone. "Success" seems to be such a magazine. It is a magazine which, with inspiration, optimism, beauty, and achievement are notable factors. Its Christmas number is in many respects the most interesting its editors have yet published. The table of contents for the holiday season is varied, timely, and interesting; the contributors being some of the most notable people in literary and public life. Among a few of the many interesting articles and personae contained in this number may be mentioned, "America Should Establish Universal Peace," by Prince Yu Yun Chun; "Greely's Ambition Culminated in His Fight for the Presidency," by Alexander K. McClure; "Envy Shoots at Thoreau," by H. H. H. H.; "Ella Wheeler Wilcox;" "Cultivate the Art of Fitting In," by Cynthia Westover Allen; "Good Employers Make Good Employees," by J. Lincoln Brooks; "The Potent Power of Our Divine Master Still Broods Over Palestine," by William Orsley Partridge; "How to Get, and Keep, a Position," by James J. Hill; "Frank H. Spurgeon and His Kingdom," which will supply two strong fiction stories; and Sarah Grand tells American women they are without a superior. The art work is in keeping with the high class of literature, which is a distinctive feature of "Success." The American Bee Journal and Success—both one year—for \$1.75.

ing with the high class of literature, which is a distinctive feature of "Success." The American Bee Journal and Success—both one year—for \$1.75.

THE Bee-Keeper's Guide;

Or, Manual of the Apiary.
—BY—

PROF. A. J. COOK.

160 Pages—16th (1899) Edition—18th Thousand—\$1.25 postpaid.

A description of the book here is quite unnecessary—it is simply the most complete scientific and practical bee-book published to-day. Fully illustrated, and all written in the most fascinating style. The author is also too well-known to the whole bee-world to require any introduction. No bee-keeper is fully equipped, or his library complete, without THE BEE-KEEPER'S GUIDE.

This 16th and latest edition of Prof. Cook's magnificent book of 460 pages, in neat and substantial cloth binding, we propose to GIVE AWAY to our present subscribers, for the work of getting NEW SUBSCRIBERS for the American Bee Journal.

Given for TWO New Subscribers.

The following offer is made to PRESENT subscribers only, and no premium is also given to the two new subscribers—simply the Bee Journal for one year:

Send us TWO NEW SUBSCRIBERS to the Bee Journal with \$2.00, and we will mail you a copy of Prof. Cook's book FREE as a premium. Prof. Cook's book alone sent for \$1.25, or we club it with the Bee Journal for a year—both for only \$1.75. But surely anybody can get only TWO NEW SUBSCRIBERS to the Bee Journal for a year, and thus get the book as a premium. Let every body try for it. Will YOU have one?

GEORGE W. YORK & CO.,
144 & 146 Erie Street, CHICAGO, ILL.

HONEY AND BEESWAX

MARKET QUOTATIONS.

CHICAGO, Nov. 19.—Honey is selling fairly well at about the prices that have prevailed for the last two months, viz: choice grades of white comb honey, 14½¢; good to No. 1, 14¢; and light amber, 13¢, with darker grades, 10¢ to 12¢. Extracted, white, 56¢ to 58¢; yellow, 55¢ to 57¢, according to quality, flavor and package. Beeswax good demand at 25¢.

R. A. BURNETT & CO.

CINCINNATI, Oct. 25.—The honey market is rather dull on account of the warm weather. Extracted sells only to manufacturers from 50¢ to 55¢; better grades alfalfa water-white from 60¢ to 70¢; white clover from 60¢ to 65¢. Fancy white comb honey sells from 13½¢ to 15¢.

C. H. W. WEBER.

ALBANY, N. Y., Oct. 25.—Honey in good demand now, as this is the most satisfactory time to sell. Grocersmen are stocking up and will buy hives, when late they only buy enough to piece out. Fancy white comb, 15¢ to 16¢; mixed, 14¢ to 15¢; buckwheat, 12¢ to 13¢. Extracted, white, 55¢ to 57¢; mixed, 50¢ to 55¢.

H. R. WRIGHT.

OMAHA, Oct. 25.—New comb honey is arriving by express in small quantities from Iowa and Colorado, and selling at 50¢ per case in a retail way. California extracted honey is being offered for sale at 45¢ to 47¢ per pound, f.o.b. California shipping-points, but we have not heard of any large lots of such quality being offered. The production of extracted honey seems to be quite large this year in Colorado, Utah and California.

PEYCKE BROS.

NEW YORK, Nov. 8.—Comb honey is in good demand, and while the market is not overstocked, receipts are sufficient to supply the demand. Fancy white sells at 15¢, with an occasional sale at 16¢ for attractive lots; No. 1, white, at 14¢; No. 2, at 13¢; fancy buckwheat, 12¢ to 15¢; No. 1 and 2, at 10¢ to 10½¢. Extracted remains quiet at 50¢ to 55¢ for white, and 45¢ to 50¢ for amber. Very little demand for dark at 35¢ to 38¢. Beeswax quiet at 25¢ to 26¢.

LEDRITH & SEIGLER.

MOSKOW, Nov. 2.—The demand for honey is easing up, some what in part to the holiday season at which time it is much neglected.

Our market at the present time runs low for strictly fancy in cartons: No. 1, 14¢ to 15¢; No. 2, 12¢ to 13¢; extracted, white, 50¢ to 55¢; amber, 45¢ to 50¢.

BLAKE, SCOTT & LEE.

DES MOINES, Oct. 25.—There is very little doing here in new grades of honey. Some small lots of near-by produced comb honey are on the market and selling in a retail way at \$3.50 to \$3.75 per case. We do not look for much trade this time here until Sept. 1. Our market does not consume a great deal of extracted honey.

PEYCKE BROS. & CHANEY.

DETROIT, Oct. 25.—Fancy white comb honey, 14¢ to 15¢; No. 1, 13¢ to 14¢; no dark to quote. Extracted, white, 60¢ to 70¢. Beeswax, 25¢ to 26¢.

M. H. HUNT & SON.

SAN FRANCISCO, Nov. 15.—White comb, 10¢ to 12¢; amber, 7¢ to 8¢; light amber, 6¢ to 7¢; extracted, white, 55¢ to 60¢; light amber, 45¢ to 50¢; amber, 40¢.

Market is moderately firm at prevailing values, which remain about the same as a week ago. There is considerable interest both on foreign and local account. A shipment of 1,000 cases extracted went forward the past week per the ship "England." A steamer took 107 cases for Holland.

KANSAS CITY, Oct. 25. Up to the present time only small lots of new comb honey have been on the market, and these met with ready sale on the basis of 15¢ per pound for fancy white, and 10¢ to 12¢ for heavier receipts are expected and quotations are based at 55¢ to 60¢ per case for large lots, which would be equal to about 14¢ to 15¢; the demand being quite brisk, a firm market is anticipated. Inquiries for extracted are a little more numerous, but large buyers still seem to have their ideas too low. In a small way 55¢ to 60¢ is quotable.

PEYCKE BROS.

A New Bee-Keeper's Song—

“Buckwheat Cakes and Honey”

Words by EUGENE SECOR.

Music by GEORGE W. YORK.

This song was written specially for the Buffalo convention, and was sung there. It is written for organ or piano, as have been all the songs written for bee-keepers. Every home should have a copy of it, as well as a copy of

“THE HUM OF THE BEES in the APPLE-TREE BLOOM”

Written by

EUGENE SECOR and Dr. C. C. MILLER.

PRICES—Either song will be mailed for 10 cents (stamps or silver), or both for only 15 cents. Or, for \$1.00 *strictly in advance* payment of a year's subscription to the American Bee Journal, we will mail both of these songs free, if asked for.

Texas Bee-Keepers.

New Branch Office. We beg to announce the opening of a branch office and warehouse at 438 W. Houston St., San Antonio, Texas. Rates of transportation from Medina in less than car-load lots are high, and it takes a long time for a local shipment to reach Southern Texas points.

Low Freight and Quick Delivery.

San Antonio as a Shipping-point.

To secure these two necessary advantages—low freight and quick delivery—and to be better prepared to serve the interests of our Texas friends, is our reason for establishing this new branch office. No other point in Southern Texas is better adapted to serve as a distributing point than San Antonio. It has four great railroads—the Southern Pacific R. R. east and West—the International and Great Northern R. R. from Laredo up through San Antonio and Central Texas, the San Antonio and Arkansas Pass R. R., and San Antonio and Gulf R. R. It also has the American, Wells-Fargo and Pacific Express Companies.

Our Managers.

We have secured as managers Mr. Udo Toepperwein, formerly of Leon Springs, and Mr. A. Y. Walton, Jr., both of whom are well known to the bee-keepers of South and Central Texas. They are also thoroughly familiar with practical bee-keeping and all matters associated with it, and any orders sent to this branch will receive prompt, careful attention.

Our Goods.

As usual, our motto is to furnish the best goods of the most approved pattern. We do not undertake to compete in price with all manufacturers. Bee-keepers have learned that it does not pay to buy cheap supplies, for a saving of 10 cents on the first cost of a hive may be a loss of many times this amount by getting poorly made and ill-fitting material. Every year brings us many proofs that our policy of “the best goods” is a correct one.

Our Catalog.

Very few changes in prices will be made in our new catalog, so do not delay your order, but send it at once. You will be allowed a refund if lower prices are made, and in case of higher prices ruling in the new catalog, if any, you will secure the benefit by ordering now. Catalog and estimates may be had by applying to the address given below.

Our Invitation.

Whenever you visit San Antonio you are invited to call at our office and make it your headquarters. Here you will find a display of Apianian Supplies not equaled elsewhere in Texas. You will also find on file the leading bee-journals to pass pleasantly your leisure time.

Spanish Catalog.

Some of you may read Spanish, or have a bee-keeping friend who does. If so, call for our Spanish catalog. It's sent free.

The Fence or the Ambulance—Which?

BY JOSEPH MALINS.

'Twas a dangerous cliff, as they freely confessed,
Though to walk near its crest was so pleasant;
But over its terrible edge there had slipped
A duke, and full many a peasant;
So the people said something would have to
be done,
But their projects did not at all tally.
Some said, "Put a fence round the edge of
the cliff;"
Some, "An ambulance down in the valley."

But the cry for the ambulance carried the day,
For it spread through the neighboring city;
A fence may be useful or not, it is true,
But each heart became brimful of pity
For those who slipped over that dangerous
cliff.

And the dwellers in highway and alley
Gave pounds or gave pence—not to put up a
fence.

But an ambulance down in the valley.

"For the cliff's all right, if you're careful,"
they said;
"And if folks even slip and are dropping,
It isn't the slipping that hurts them so much
As the shock down below—when they're
stopping."

So day after day, as these mishaps occurred,
Quick forth would these rescuers rally,
To pick up the victims who fell off the cliff,
With their ambulance down in the valley.

Then an old sage remarked, "It's a marvel
to me

That people give far more attention
To repairing results than to stopping the
cause.

When they'd much better aim at prevention,
Let us stop at its source all this mischief,"
cried he.

"Come, neighbors and friends, let us rally—
If the cliff we will fence we might almost
dispense
With the ambulance down in the valley."

"Oh, he's a fanatic," the others rejoined;
"Dispense with the ambulance? Never!
He'd dispense with all charities, too, if he
could;

No, no! We'll support them forever!
Aren't we picking folks up just as fast as they
fall?"

And shall this man dictate to us? Shall he?
Why should people of sense stop to put up
a fence
While their ambulance works in the valley?"

But a sensible few, who are practical, too,
Will not bear with such nonsense much
longer;

They believe that prevention is better than
cure.

And their number will soon be the stronger,
Encourage them, then, with your purse, voice,
and pen.

And while other philanthropists dally
They will scorn all pretence, and put a stout
fence

On the cliff that hangs over the valley.

Better guide well the young than reclaim them
when old.

For the voice of true wisdom is calling:
"To rescue the fallen is good, but 'tis best
To prevent other people from falling."
Better close up the source of temptation and
crime

Than deliver from dungeon or galley;
Better put a strong fence round the top of the
cliff.

Than an ambulance down in the valley!

Selected.

EXECUTIVE COMMITTEE.

ERNEST R. ROOF, President.
R. C. ALKIN, Vice-President.
DR. A. B. MASON, Secretary, Toledo, Ohio.

EUGENE SECOR, General Manager and Treasurer, Forest City, Iowa.

MEMBERSHIP DUES, \$1.00 a year.

If more convenient, Dues may be sent to the office of the American Bee Journal, when they will be forwarded to Mr. Secor, who will mail individual receipts.

A Celluloid Queen-Button is a very pretty thing for a bee-keeper or honey-seller to wear on his coat-lapel. It often serves to introduce the subject of honey, and frequently leads to a sale.

NOTE.—One reader writes: "I have every reason to believe that it would be a very good idea for every bee-keeper to wear one (of the buttons) as it will cause people to ask questions about the busy bee, and many a conversation thus started would wind up with the sale of more or less honey; at any rate it would enlighten many a person in regard to honey and bees."

The picture shown herewith is a reproduction of a motto queen-button that we are furnishing to bee-keepers. It has a pin on the underside to fasten it.

Price, by mail, 6 cents; two for 10 cents; or 6 for 25 cents. Send all orders to the office of the American Bee Journal.

No. 4 "Barler Ideal" Oil-Heater.

The "Barler Ideal" OIL-HEATER

**Saves Its Cost Every Year!
NO ODOR! NO SMOKE! NO ASHES!**

Costs only a cent an hour to run it.

The editor of the American Bee Journal is using the "Barler Ideal" Oil Heater, and it is all right in every way. We liked it so well that we wanted our readers to have it too, so we have recently arranged with its manufacturers to fill our orders. The picture shown herewith is the one we recommend for general use. It is a perfect gem of a stove for heating dining-rooms, bed-rooms, and bath-rooms. It hinges back in a substantial way, and is thoroughly well made throughout. The urn removes for heating water. The brass front, or well, has a bail, and holds nearly one gallon of kerosene oil. It is just as safe as an ordinary lamp. You wouldn't be without it for twice its cost, after once having one of these stoves. Most oil-stoves emit an offensive odor, but this one doesn't. Its height is 24" feet, and weighs 20 pounds, or 30 pounds, crated ready for shipment, either by freight or express.

Price, f.o.b. Chicago, \$6.00; or, combined with a year's subscription to the American Bee Journal—both for only \$16.50. FULL DIRECTIONS GO WITH EACH STOVE.

If you want something that is really serviceable, reliable, and thoroughly comfortable, you should get this "Barler Ideal" Oil Stove, as it can easily be carried by any man from one room to another, and thus have all the heat you want right where you want it.

Address,

GEORGE W. YORK & CO.,
Chicago, Ill.

Please Mention the Bee Journal when writing Advertisers.....

The Novelty Pocket-Knife.

Your Name and Address on one side—Three Bees on the other side.

[THIS CUT IS THE FULL SIZE OF THE KNIFE.]

Your Name on the Knife—When ordering, be sure to say just what name and address you wish put on the Knife.

The Novelty Knife is indeed a novelty. The novelty lies in the handle. It is made beautifully of indestructible celluloid, which is as transparent as glass. Underneath the celluloid, on one side of the handle is placed the name and residence of the subscriber, and on the other side pictures of a Queen, Drone, and Worker, as shown here.

The Material entering into this celebrated knife is of the very best quality; the blades are hand-forged out of the very finest English razor-steel, and we warrant every blade. The bolsters are made of German silver, and will never rust or corrode. The rivets are hardened German silver wire; the linings are plate brass; the back springs of Sheffield spring-steel, and the finish of the handle as described above. It will last a long time, with proper usage.

Why Own the Novelty Knife? In case a good knife is lost, the chances are the owner will never recover it; but if the "Novelty" is lost, having name and address of owner, the finder will return it; otherwise to try to destroy the name and address, would destroy the knife. If traveling, and you meet with a serious accident, and are so fortunate as to have one of the "Novelties," your POCKET KNIFE will serve as an identifier; and in case of death, your relatives will at once be notified of the accident.

How appropriate this knife is for a present! What more lasting memento could a mother give to a son, a wife to a husband, a sister to a brother, or a lady to a gentleman, the knife having the name of the recipient on one side?

The accompanying cut gives a faint idea, but cannot fully convey an exact representation of this beautiful knife, as the "Novelty" must be seen to be appreciated.

How to Get this Valuable Knife.—We send it postpaid for \$1.25, or give it as a Premium to the one sending us the most new subscribers to the Bee Journal (with \$3.00). We will club the Novelty Knife and the Bee Journal for one year, both for \$1.00.

GEORGE W. YORK & CO.

St., Chicago, Ill.

Please allow about two weeks for your knife order to be filled.

AMERICAN BEE JOURNAL

ESTABLISHED IN 1861 THE OLDEST BEE-PAPER IN AMERICA

41st YEAR.

No. 49.

Editorial.

The Cry of Adulterated Honey.
 heard lately in Chicago, is bound to interfere somewhat with the sales of the pure article. The Daily Tribune, of this city, had the following in regard to the subject, in its issue of Nov. 15, introduced by a heading in large type, "Law Stops Bokus Honey:"

"Glucose honey, under the attractive guise of 'pure clover honey,' is invading the Chicago markets to such an extent that the efforts of the State pure food inspectors are largely directed toward investigations of this imposition. One entire carload of 'honey,' consigned to J. Dawson, of the Western Brokerage Co., 12 River street, from a California firm, was barred from the markets yesterday except as a plainly labeled adulteration.

The analysis of the "honey" composing the consignment showed that it contained from 50 to 60 percent of glucose, and as "pure honey" the stuff was condemned. The consignment had the choice of selling it as a glucose mixture or of sending it back, and he chose the latter course, at the same time cancelling other orders which would have brought other large quantities of the glucose honey into Chicago.

HARM IS TO THE PURSE.

Unlike many of the adulterations which flood the market, the glucose honey is not regarded as an injurious mixture, and the Pure Food Commissioners affirm that the imposition on the purchaser is one which injures his pocket-book and not his health. The dealer has the right to sell the "honey" under the label of glucose mixture, and as such it is worth about one-fifth as much as real honey.

One complainant, Dr. A. J. Park, 520 East Fifth street, said:

"I know of no place in Chicago where one can purchase a pound of pure honey. I called the attention of my grocer to the fact that his tin cases of 'white clover honey' was manufactured stuff made up of glucose and paraffine. He at once called on his South Water street merchant and demanded that his money be refunded, or that the merchant disclose the name and place of the party from whom he got the mixture, but he declined."

Similar complaints have been received by the Pure Food Commission, and investigations have resulted in the preparation of a list of offenders against whom suit will be brought for violation of the pure-food laws.

HOW TO DETECT IMPOSITION.

Commissioner Jones said it was comparatively easy for a purchaser to detect the imposition.

"Genuine honey," he declared, "has brown coloring around the cells. Glucose honey is perfectly white. The purchaser can detect the fraud by this simple rule. Honey, butter, and vinegar are the three articles in the purchase of which citizens are most subject to imposition just at present, and they are

causing most of the work for the commission. Syrups may be classed with honey in this respect.

In the issue of the Tribune for Oct. 16 (the next day) appeared the cartoon which we reproduce herewith, and which only added incitement to the injury done by publishing the interviews with Dr. Park and Commissioner Jones.

As soon as we could give attention to the matter, we wrote the following reply to the foregoing, and took it in person to the Tribune office, together with a beautiful section of white honey from our own apiary, and also a glass jar of the absolutely pure article:

CHICAGO, NOV. 19, 1901.

EDITOR THE TRIBUNE—

My Dear Sir:—I desire to call your attention, as well as that of your readers, to several matters that appeared in your esteemed

THE TRIBUNE'S TREBLOUS CARTOON.

paper last week. Quite unwittingly you did a great injustice to an honest and honorable industry, that of bee-keeping or honey-production. Being somewhat of a representative of the bee-keepers of this country, I deem it due my constituency, as well as due the general reading public, that I endeavor to correct so far as possible the misleading statements that were published.

First, permit me to say that bee-keepers as a class are most persistently opposed to the adulteration of honey; their representative periodicals also have done all in their power to aid not only the enactment but the active enforcement of laws intended to prohibit the adulteration of honey, or compelling the mixers of the combless article to label it according to its exact ingredients. Then if people desire to purchase and eat glucose

combined with honey, they "pay their money and takes their choice."

In the alleged interview with Mr. Jones, the Pure Food Commissioner of Illinois, as published, he is made to say:

"Genuine honey has a brown coloring around the cells. Glucose honey is perfectly white. The purchaser can detect the fraud by this simple rule."

Permit me to say that the above would be important if it were true. Unfortunately, or fortunately, there is no truth in it. First, much genuine comb honey is perfectly white in appearance; and, second, there is no glucose comb honey produced.

Again, Dr. A. J. Park, in the same item, is credited with this paragraph:

"I know of no place in Chicago where one can purchase a pound of pure honey. I called the attention of my grocer to the fact that his tin cases of 'white clover honey' was manufactured stuff made up of glucose and paraffine. He at once called on his South Water street merchant and demanded that his money be refunded, or that the merchant disclose the name and place of the party from whom he got the mixture, but he declined."

It is almost exasperating to one who is at all acquainted with the honey business to read such a paragraph as that. Of course, even doctors ought not to be supposed to know everything, and so Dr. Park perhaps should not be blamed for not knowing where in all Chicago he could get a pound of pure honey. But there are tons upon tons of absolutely pure honey in Chicago at almost any time of the year. I can take the innocent Doctor to see several carloads of the genuine article any time he will accompany me.

Dr. Park also conveys the idea that there is such a thing as manufactured comb honey—the comb made of paraffine and filled with glucose. I want to say that the Doctor has now an excellent opportunity to get a larger single fact than he ever has received, or will likely ever receive in the future if his medical knowledge is on a par with his information about pure honey. There has been an offer of \$1000 standing, but unclaimed, for 20 years, to any one who would find and present a single pound of comb honey which bees had no part in manufacturing. That offer is open yet, and I will personally guarantee that it is bonafide, or will make a similar offer. Now, gentlemen, either present that pound of manufactured comb honey, "or for ever after hold your peace" about it.

It is very unfortunate that the daily press does not seek its information concerning such matters from those who are in a position to know. It certainly would not go to a blacksmith to learn of the production of silk; then why should it accept the dictum of those who don't know a bee from a horse, when they desire information on honey-production?

I do not believe that The Tribune would willingly injure any honest industry, but in publishing such matters I have referred to, and also the cartoon on "How doth the little busy bee," in the Nov. 16th issue, it is placing before its readers, untruths, and at the same time doing great injury to the producers of genuine honey throughout the whole country.

Yours very truly,

GEORGE W. YORK,
Editor American Bee Journal.

As a result, a few days later the following appeared in The Tribune:

SAYS MUCH HONEY IS PURE.

EDITOR OF THE AMERICAN BEE JOURNAL,
TAKES EXCEPTIONS TO STORIES OF
ADULTERATION.

That the bee-keepers as a class are opposed to the adulteration of honey is avowed by George W. York, who, as editor of the American Bee Journal, is in close touch with the industry. Mr. York declares that there is plenty of pure honey on sale in Chicago, and takes exceptions to statements that have been made by men who are supposed to know something about pure food. In a letter to The Tribune he says:

"The bee-keepers have done all in their power to aid not only the enactment but the active enforcement of laws intended to prohibit the adulteration of honey, or compelling the mixers of the combless article to label it according to its exact ingredients. In an interview Mr. Jones, the Pure Food Commissioner of Illinois, is made to say:

"Genuine honey has a brown coloring around the cells, glucose honey is perfectly white. The purchaser can detect the fraud by this simple rule."

"This would be important if it were true. Unfortunately, or fortunately, there is no truth in it. First, much genuine honey is perfectly white in appearance; and, second, there is no glucose comb honey produced."

The carload of honey referred to in the first quotation from The Tribune, is extracted honey in tin cans. We looked it up both at the offices of the Pure Food Commission and the Western Brokerage Co., and found that the chemist of the former had discovered about 25 percent glucose in the sample submitted to them by the Western Brokerage Co., the latter firm having become suspicious of the honey. After hearing the result of the analysis, they reported it to the California firm from whom they bought it (in Oakland, we believe), and were holding the honey subject to the orders of the California firm, it being still in the car. We understand that the California firm declare it is pure honey, and that their representative is coming on to Chicago to prove it. He will likely have a hard job of it, if he comes.

We believe The Tribune, in publishing the statements credited to Dr. Park and Commissioner Jones, has done more damage to the cause of pure honey than it can remedy in a long, long time to come. Also, the cartoon, which pretends to illustrate how so-called "comb honey" is manufactured, is another unfortunate thing. Already, we hear that Chicago grocers are feeling the ill effects of the misleading reports and misstatements published by The Tribune, and their honey sales are diminishing accordingly. One dealer said that the falling off in the sales of pure honey would be at least 25 percent. While all lovers of truth and right will appreciate the slight correction which The Tribune published a few days later, it could hardly have done less, in justice to the honest people and industry which it misrepresented, than to have given in full the letter we wrote for publication.

It is exceedingly unfortunate that newspapers do not apply to those who are in a position to know the facts concerning technical matters. With all the bee-keepers living in and around Chicago, and of such easy access, there need never be anything misleading, or the least bit untrue, given in the public press concerning bees or honey-production. But it would not be quite so discouraging, if when an error has been published, there would be shown some anxiety to have it corrected, so that the injustice could be righted as nearly as possible.

Let us hope that more care may be exercised hereafter on the part of those who think they must write or speak to subjects with which they are wholly unfamiliar.

The Buffalo Convention.

Report of the Proceedings of the Thirty-Second Annual
Convention of the National Bee-Keepers' Association,
held at Buffalo, New York,
Sept. 10, 11 and 12, 1901.

(Continued from page 759.)

CREATING A DEMAND FOR HONEY.

"How can a demand for honey be developed in a city where at present there is little or none consumed?"

Mr. Niver—I have been for six months now working up a demand for extracted honey in private families by house-to-house canvassing, and I must say that I am delighted with my success, by going direct to the family, sitting down and telling them how we get it; showing them pictures of our extractors, and taking along some foundation, and so on. Getting them interested in the bee-talk, I can sell them, perhaps, a pound, or ten pounds, and in about a month I go around again. I have found that there is a demand worked up that way which brings good results, and by going the third or fourth time I find that the demand is not diminished, but increased. People do not know that honey is the cheapest sauce that can be bought. Everything is very high in the line of sauce. Fruits are very high, and the working people feel that very severely. Now we are having boom times, and the most prosperous times known to this country, and the hardest times for a man to support his family on his wages that I have ever seen. By going direct to the people themselves, and teaching them about extracted honey, not comb—they look on comb honey as a luxury beyond their pockets. I have tried this method for six months and I have two or three different towns worked up. I find that the trade is growing in most towns, and in a little while we will get so that we can get our bulk honey into the groceries. We can not do it now. You can not sell honey in a bottle, with a nice label on it, for 25 cents a pound. You have to offer it at reasonable rates by the pound, and then you can sell it.

Mr. Cook—How many of those lectures could you give a day?

Mr. Niver—I don't know; I talk several hours a day.

Mr. McEvoy—What size of samples do you usually sell?

Mr. Niver—My method is to take along the honey in 10-pound cans. I go into the house with a quart milk-bottle and a teaspoon inside of it, and ask for a small dish to put some honey in; and I get them all in there eating honey, and I make them use their own spoons. While they are doing this I am explaining how we get it. I have been selling 8 pounds for a dollar, for fine white honey. The great majority of people get paid once a month; if you go just after pay-day you can sell a great deal more than you can before.

H. C. Ahlers—Would you kindly give

us figures of what you could sell in a day in that way?

Mr. Niver—I have sold 300 pounds in a day, and I have sold as low as 35 pounds in a day.

Mr. Ahlers—I sold a thousand pounds in two days, in 3 lb. Mason jars and 13-lb. pails; ten cents a lb. straight. If a groceryman wants my honey it is worth 10 cents a lb. I sell to private families for strictly cash, in Milwaukee and vicinity. I weigh in the pail. The pail costs \$11 a hundred, and I weigh the pail in. This gives me about 9½ to 10 cents for the pail. I lose about 1½ cents on the pail. I sell the honey in the Mason jars without the jar. I go to private families and keep a record of them. I know where I am going when I start. I take a thousand pounds along, and make the trip in two days. I sold 8,000 pounds in six trips, 2,000 pounds around home. I sold my own crop of 6,000 pounds, gathered from 37 colonies, and bought 2,000 lbs.

Mr. Howe—I feel sorry for a bee-keeper who produces honey and can't sell it. I can't produce enough to fill my orders.

J. H. Fuller—For the benefit of comb-honey men, I wish to say a word or two. I retail comb honey, and I retail from 100 to 300 lbs. a day in small towns in Cattaraugus County. I take it from house to house, the same as these gentlemen retail their extracted honey. I am getting 15 cents a lb. for No. 1 honey, and for dark honey all the way from 8 to 10 and 12 cents, according to the quality. I go on Tuesdays, our pay-day is Monday, and I want to go when they have money.

W. L. Coggs—The wholesale price is retail; no trouble to sell that way.

Mr. Niver—I have heard a good deal said on what package we shall put our honey in, but I have got so that I believe I don't want any package at all. I prefer every time to have the lady produce her own package. She is sure it is clean, then.

Mr. Ahlers—Well, people offer me a package and they offer me butter-crocks. I live about 28 miles from Milwaukee. I would have to haul their butter-crocks. I allow them 10 cents for the pail.

Mr. Tyrrell—I would like to ask Mr. Niver what argument he uses to answer the question why extracted honey is cheaper than comb honey.

Mr. Niver—By showing the picture of the extractor and telling them that the bees build the comb only once, and we put it back and they fill it up again.

Mr. McEvoy—I think if every State in the union, and Canada, had some one going around in that way, talking to people, it would be a good thing.

Huber Root—For the past two months I have been seeing a great many people at the Pan-American Exposition, and I find eight out of ten of them imagine we mash the comb up and squeeze the honey out through a cheese-cloth; they know absolutely nothing about bees, or anything about the way extracted honey is secured.

Mr. Vinal—I think it is a good plan, but we are not all able to hire so smart a man as Mr. Coggsall is able to hire.

Mr. Tyrell—It is true that not all of us are salesmen. The majority of people who produce honey are not capable of selling that honey by a house-to-house trade where we have to take up the time to explain how the honey is produced and why it is cheaper. The plan that I used was to put up my honey in suitable packages, then taking a circular which was just as brief as possible, explaining how the honey was produced—I would use say quart fruit-jars—and leave this package and circular, together with another small circular telling the people why I left it in this way. Ninety-nine out of 100 people, as soon as they step to the door and hear you have something to sell, say "No." I leave the package of honey and the circular, take the number of the house, tell them I will call again on a certain day, and pass on. Then I look over the same territory a second time, and I found that if I left it long enough—perhaps a week—if they were honey users, they had sampled the honey, found it was good, and would pay for it.

Mr. Longnecker—I would like to ask if Mr. Tyrell ever left a jar of honey at a place, and when he came again in a week and the honey hadn't been used and they didn't want it.

Mr. Tyrell—I found there was only one place where anything like that ever occurred, and that was at the house of a lady where the honey had decreased perhaps an inch, and she said it had run over the top! That is the exception.

Udo Toepperwein—Do you label all your honey?

Mr. Tyrell—Yes, sir, telling where it is produced.

Mr. Toepperwein—We label all our first-class honey, and get the groceries to sell it, and after the people get to use it it will speak for itself.

Mr. Vinal—I have had a little experience in selling comb honey, and my plan has been to put the honey in show-cases, properly labeled, and place it in the stores on the commission plan, and let them sell it at retail. I get 25 cents for it retail, and 20 cents at the stores.

SELLING HONEY THROUGH THE STORES.

"Would you sell honey through the stores?"

Dr. Mason—I think that has been answered already.

Mr. Toepperwein—If a person has plenty of time, I think they would do better to retail it.

Mr. Fuller—I wouldn't take it to the groceries, for this reason: I don't want groceries enough to pay for what honey I have. I would rather have some money, and most of the grocery-men in my section want me to take trade. If I want any trade I have no objection to selling them one or two cases of honey, but where I want the money, and don't want trade, then I retail it and get the money for it.

Mr. Niver—I would like to ask at what price he sells to the groceryman.

Mr. Fuller—The same price—15 cents a pound.

Mr. Niver—And what do they sell it for?

Mr. Fuller—They make their profit on the goods they give me.

Mr. Niver—I have been a groceryman for many years and you couldn't teach me that.

Mr. Fuller—You talk about the price of 15 cents being low; I can go to commission houses today and buy No. 1 white clover honey for 13 cents a pound.

Mr. York—I think it makes a great deal of difference where you are. I would by all means work through the groceries in large cities. Probably you couldn't do that in small country places, where there is only one or two groceries—there you'd have to sell from house to house.

Mr. Vinal—Speaking about the price of honey, I would like today to buy 500 lbs. of comb honey at 13 or 15 cents a lb. delivered at my place, for my trade at the stores. I would pay 15 cents a pound for 500 lbs. I can not get it in Boston.

Mr. Fuller—I would like to ask one more question of these gentlemen who retail their honey in the cities, whether they have any trouble with the authorities, whether they have to obtain a license to do their work, or whether they go on without being molested by anybody.

Mr. Ahlers—I am a bee-keeper, and I have a right, at least in Wisconsin, to sell my own produce. Now, I don't know if I have a right to buy the honey and sell it, but those questions are never asked. I have sold it to several policemen, who never asked me any questions, and I think there will be no trouble at all.

E. Granger—I have noticed one difficulty about retailing honey, and that is, there are so many bee-keepers who sell for the same price at retail as at wholesale. In the district where I live there are quite a few bee-keepers in a small way, and they generally run out of all the honey they have for sale, and then try to buy at wholesale, and find they cannot; it is all being sold at the same price, 1 lb. or 100 lbs. When I have sold out what little I have, and want to get more at wholesale, I can not get it.

Mr. Miller—With us we have to protect the groceries. If I sell honey at 10 cents retail I must to the grocery trade, and I always protect them by that means. I still sell at retail, as much as possible, and at the present time I am getting 11 cents for my extracted honey, including the tins.

ARE QUEENS INJURED IN MAILING?

"Does it injure queens to send them by mail?"

Dr. Mason—Yes.

Mr. Benton—No. It does injure them if they are improperly packed; if well packed it does not, I believe.

Dr. Mason—I would agree with him, but I never saw one well packed yet.

J. M. Rankin—I think the danger to queens sent through the mail is about as great as that of a person traveling on a railroad, provided the bees are properly handled.

Fred Schmidt—Do you think they are properly handled today, the way

they are thrown out and kicked around? I do not.

Huber Root—I think the trouble is in the confinement in passage through the mail, and not particularly from the rough handling. You take a queen when she is laying well and shut her up for several days, and keep her right in the hive and she will not do so well after it.

W. W. Lathrop—Take queens and cage them properly, pack them, keep them a week, then liberate them and see if you can not notice a difference. I have tried quite a good many experiments. I was led to it from buying queens. My experience is that they do not lay so regularly. The combs will not fill so well. There are more "skippers," and she will begin to fail sooner.

Mr. Benton—I receive a great many queens from different countries, and often as far as the Island of Cyprus, and those queens were well packed. I prepared the cages myself, sent them there and gave careful instructions as to how the bees should be put into them, and in no instance have I been able to perceive that those queens that had been from 16 to 20 days in the mail sack, and traveled 6,000 miles, had been injured by that journey.

Mr. Gemmill—Aside from the packing don't you think that the caging of a queen a few days before she is shipped has a great deal to do with the safe delivery of the queen?

Mr. Benton—I don't practice that. One point has been brought up, that of throwing the mail-sacks from the train. In cases where I knew it was to be thrown from the train I enclosed the cage in a cloth-lined envelope, which would tend to protect the cage in case of a shock.

Mr. Fuller—What kind of a cage do you ship in?

Mr. Benton—It is a small, wooden cage with three holes in it—a cage which I invented some years ago. One end has the food compartment; the center compartment is a dark chamber with only indirect ventilation; at the other end is the ventilating chamber.

Mr. Fuller—How many bees do you place in there as an accompaniment?

Mr. Benton—From 10 to 20, according to the time of the journey.

Dr. Mason—One of two things is certain: The queens are injured in the mail, or else the queen-breeders send out poor queens. I have paid as high as \$8.00 for a queen and I would not give eight cents for it finally. Every last one of them—except one I got last year—proved to be poor.

Mr. Cook—There are hundreds of testimonies that they are good and they do produce good and prolific bees.

Dr. Mason—Yes, sir, I can give you one good one out of eight.

Mrs. Acklin—We not only send out queens through the mails, but we get in queens, and it is very seldom that we get one that is not all right.

BEES MOVING EGGS.

"Do bees move eggs from one cell to another?"

Mrs. Acklin—I think they do. I think they move an egg occasionally from one hive to another.

Mr. Gemmill—I am quite satisfied they move eggs from one cell to another.

MATING OF QUEENS.

"In queen-rearing, are the evils of in-breeding greater to mate father and daughter, or sister and brother?"

Dr. Miller You are asking a question about which is the worse of two things, either of which is impossible. You cannot breed father and daughter, because the father is dead before any of his children are born. You can not mate sister and brother, for the drone has no sister except his mother. In this matter of breeding it is a matter of close blood you are considering, and whatever you may call them the queen is the daughter of her mother, and also the daughter of the drone with which the mother mated, but the drone is the son of his mother. Now if you say he has any father, it must be his grandfather. He has precisely the same blood as his mother. So when you are considering breeding in cattle the nearest that you can have is between brother and sister; and that near blood in this case is between the drone and his mother, so that if you take it in the sense that you are talking about other animals, the drone is the brother of his mother.

RED CLOVER QUEENS.

"Are the progeny of what are advertised as red clover queens better honey producers than the progeny of queens reared by other queen-breeders?"

Mr. Greiner—I notice that all queen-breeders today advertise the red clover queens; none have others.

LONG-TONGUED BEES.

"Are long-tongued bees desirable?"
Mr. Howe As I sent Mr. Root a bee a while ago, and he sent me back word that she had as long a tongue as any he had measured that year. I would like to tell you the difference between that colony and common colonies. These bees with long tongues gathered honey when my black bees were starving to death. The black bees were really starving, and these bees weren't robbing.

SPELLING REFORM.

"Is reform spelling desirable in bee-keeping?"

Dr. Mason—Yes.

Mr. Ahlers—No.

Dr. Mason—Desirable everywhere.

SELECTING A HOME BEFORE SWARMING.

"Do bees ever select a home before swarming?"

Dr. Miller Yes.

Mr. Callbreath—Sometimes; not always.

MATING WITH AN IMPURE DRONE.

"Does a pure-blooded queen become contaminated by mating with an impure drone, so that her drone progeny will be impure?"

Mr. Cook No.

Mr. Benton I don't think she does, practically. There are some very curious effects, but it seems to me that the question is open to a slight dispute. That is as far as I would go in it.

Dr. Mason Now, the queen mated with the drone and secures what seminal fluid she wants for life, does she not?

Mr. Benton Supposed to.

Dr. Mason Can she keep up that supply without renewing it in any way,

so as to fertilize the thousands upon thousands of eggs that she lays.

Mr. Benton I should suppose she might keep up that supply during a fairly long life, but, as we well know, that supply is often exhausted, and the queen is utterly exhausted and lays drone-eggs.

Dr. Mason Then she doesn't in any way add to the supply of that seminal fluid from herself—no growth of it at all?

Mr. Benton—No. I don't think that is possible.

Dr. Mason—Then, if that is not possible, the progeny can not become contaminated in any way?

Mr. Benton Except by the possibility of her having mated the second time.

Dr. Mason Mr. Doolittle thinks that the queen does in some way add to her supply of the seminal fluid, so that she can keep that up; if she does, then may she not be making that impure?

Mr. Benton I don't think impurity comes in that way. It is the presence in the system of this foreign substance—a substance derived from the male bee—which contaminates the blood of the queen-bee, and thereby the drones.

Dr. Mason—Now, will it do it?

Mr. Benton—That is the question that is unsettled.

BEE SPACE OVER BROOD-FRAMES.

"Why should the top-bar of the brood-frame of the Langstroth hive be below the top of the edge of the hive instead of even with the top? Is there any advantage in having the bee-space on top of the frames in the brood-chamber, or under the frames, and have the bee-space on the under side of the super?"

D. H. Coggs—In extracting honey it is very essential to have a bee-space on top.

Dr. Mason—There certainly is an advantage in having the bee-space on top instead of the bottom. If there is no bee-space on the bottom, and you set the hive down with bees on the bottom of the frames, you are liable to crush them. In my hives I have the top of the frame even with the top of the hive.

John Fixter—We have both above and below, and I wouldn't have a hive in the yard that didn't have a bee-space above.

Mr. Betsinger—No hive is perfect by omitting a bee-space on top of the frames. If the space is omitted on top of the frames, and the same is added underneath the frames, where you use the two in connection, and when the season is good, and they are somewhat crowded, they will place burr-combs between the lower frames and the frames above. Now, in removing those frames, if the bee space is underneath the hive not on top—then these burr-combs adhere to the ends. If the bee-space is omitted on top of the brood-chamber, and is put in the super, you are living under the same disadvantage as you change supers from one hive to another those burr-combs must be removed.

The convention then adjourned until 1:30 p. m.

THURSDAY AFTERNOON.

The convention was called to order by Pres. Root.

CHANGES IN THE CONSTITUTION.

Mr. Abbott I have a matter I would like to present, and before I do that I would like to tell the members of this Association something that I think they ought to know. This room is occupied by a great many societies, and the janitor who looks after it said that you had been the cleanest set of people that he ever had anything to do with; that you didn't smoke, or chew, or make the room dirty, and I thought you ought to know it. You can see that it pays to be decent. I have here a recommendation of the Board of Directors which I wish to read. The directors present at this meeting recommend the following amendment to the constitution: "Art. IV. Sec. 1, to be changed to read as follows: 'The officers of this Association shall be a General Manager, a President, a Vice-President, a Secretary, and a Board of twelve directors, whose term of office shall be for four years, or until their successors are elected and qualify, except as provided in Sec. 2 of this Article.' " Now, the change in that Article is this: The present Article says the Board of Directors shall consist of the General Manager and twelve directors, making the General Manager a member of the Board of Directors. Now, our reason for wanting to make this change is that the General Manager is an employee of the Board of Directors, and we want to make it so that the Board of Directors will control him, and he will not be a member of the Board, and that gives the Board a chance to do what they are empowered to do in the next Article, which I will read.

Dr. Mason—That simply provides for removing the General Manager from the position of a Director.

Mr. Abbott—That is all. He continues as secretary of the Board and as General Manager. "To Sec. 8 of Art. V., add the following: 'And said Board of Directors shall have power to remove from office the General Manager for any cause they may deem sufficient, and fill the vacancy until the next annual election.' " Now, this amendment has no reference to the General Manager at present. It just provides for a contingency that might arise. It gives the Board power to say to him, We don't like this way of doing, and we will simply remove you until the next election. And then the members can elect a General Manager just as you have been electing him.

Moved by Dr. Mason, and seconded by Mr. Benton, that the convention endorse the recommendations made by the Board of Directors. Carried.

CARNIOLAN HIVE-ENDS, ETC.

Mr. Benton then exhibited some front ends of Carniolan hives which he stated had been in use many years, one of them since 1835. He spoke of the effect of the bees clustering in front of them, they making no impression on the board where it was painted, showing that they were unable to grasp smooth surfaces, such as the smooth surface of fruit. He further said: These hives open at the rear end, and in Carniolan their plan is to feed highly and stimulate until the time for swarming comes, and get them in condition for the buckwheat harvest. Probably

19-20 of the bees in Carniola are in box-hives.

Mr. McEvoy—How is the yield of honey?

Mr. Benton—Very good, indeed. There are miles and miles of buckwheat. In extracting the honey, they first put it in a sack, comb and all, and then subject it to great pressure. Of course, it is "strained" honey, and contains quantities of pollen. It is excellent bee-food, though. It stimulates brood-rearing more rapidly than the feeding of sugar.

Mr. Barb—If they were to save their bees, would the country have too many?

Mr. Benton—I don't think they would. They take out their weakest colonies. Foul-broody colonies are almost sure to be taken out.

Mr. McEvoy—What are their winters like?

Mr. Benton—Very long and severe. I saw the mercury once 20 degrees below zero, and very deep snow in most of the province. It is elevated from one to ten thousand feet above the sea level. It is quite cold in October, and very cold in November, and it lasts until March and April, with a very long, cold spring following away into May. The percentage of loss of bees in the

winter is quite small, and spring dwindling is a thing almost unknown. The winds sometimes change very suddenly, bringing a thick fog down into the valleys, and thousands of the flying bees are killed then, but, notwithstanding that, the colonies are so prolific that they revive very quickly. During the buckwheat harvest the same thing occurs. I have sometimes seen all of the working force of a colony wiped away in a single hour, and thereby the hope of any future yield of surplus honey during that harvest was entirely precluded.

(Continued next week.)

Contributed Articles.

Gathering Not in Proportion to Length of Tongue.

BY G. M. DOOLITTLE.

DURING the spring and early summer of 1901 quite a little was written regarding the high gathering qualities of bees having long tongues, and many advertisements were inserted in our bee-papers, holding out inducements to purchasers, prominent among which was long tongues, as the bees having such were the ones which secured the greatest yields of honey; and especially so in districts where the red clover was grown by the farmer for hay and pasturage for his flocks.

At that time I did not dream that I should have any chance to know for myself of the correctness of this long-tongue matter, for nearly a score of years had elapsed since red clover bloomed or gave seed in these parts, owing to a very small weevil, called a "midge," working in the head of the clover just before the blossoms were to open, this causing the blossoms, while in the bud, to blast, so that not one bud in a million came to perfection. But the past season, from some cause or other, the midge seemed to be absent, and before I was hardly aware of it, my eyes beheld hundreds of acres becoming red with the bloom of red clover.

And at about the same time the weather became hot and favorable for honey-secretion, so that by June 20 we had a yield of honey on, second to none that I had ever known at that time of the year. In fact, the flow of nectar was nearly, if not quite, as great as any I had ever known from basswood when at its best, except that the nectar is always thinner from clover than from basswood. And this flow of nectar from clover continued, in varying degree, clear through the basswood yield and up to August 1, thus helping greatly to finish up and complete nearly all the partly finished sections remaining at the close of the basswood bloom. As a result, I obtained (together with what was secured from buckwheat, which gave only a light flow) the largest average yield, from colonies not robbed for queen-rearing, of any ever obtained during the 32 years I have kept bees, namely: an average of 176 pounds of section honey per colony at the out-apiary, and 180 pounds here in the home yard.

In the home yard I had two colonies close to each other, one being headed by a queen from my original honey-gathering stock, and the other by a very fine-looking queen procured by way of exchange, during 1900, from a bee-keeper in Iowa. These colonies were as nearly alike as to outward appearance in early spring as two peas, but as the season advanced the brood in the colony having the Iowa queen outstripped that from the other by thousands of cells, till I began to think I had a prize in this new queen; but when the season closed I found that I had from the colony headed by the queen of my rearing, 261 completed one-pound sections, 21 partly filled, and 42 pounds in the brood-chamber; while the colony having the Iowa queen gave only 44 poorly filled sections, none partly filled, and had only 12 pounds in the hive October 1, so that they had to be fed 14 pounds for wintering.

Remembering that I had seen somewhere in the bee-papers that it would be fair in testing this long-tongue matter, bees from the colony giving the poorest yield of honey should be sent as well as those from the one giving the greatest yield, I bethought myself to send a dozen of these bees,

(from each colony) to Prof. Gillette, of the Colorado Agricultural College, as he had asked for bees to measure, through the columns of the American Bee Journal, and I accordingly did so. When Mr. Gillette reported he gave as the average of "Lot 1" (from my queen) 25.4; and of "Lot 2" (from the Iowa queen) 25.6, the same being in hundredths of an inch. So it will be seen that the colony giving less than one-sixth the yield of the other, really had the longest tongues.

Both colonies were managed as nearly alike as could possibly be done, up to about the first of July, when the Iowa bees began to swarm, and kept it up more or less, all through ten days of the best part of the harvest. They were not susceptible to the management of the apiarist as were the others, but with the honey harvest they went to an excess in breeding, and used up the honey which they gathered in breeding a superfluous number of workers which took to swarming rather than to honey-gathering, and thus the season was frittered away to little advantage to the apiarist.

My observation has been the same this year as in years past, that the bee which is the most susceptible to the management of the apiarist, so that a maximum amount of bees can be brought on the stage of action, with little, if any, desire to swarm, just at the commencement of the honey harvest, with as few bees at all other times as is consistent with this object, is the bee which rolls up the honey to the account of the apiarist every time.

But I hear some one saying that the length of the tongues of these bees varied only two-tenths of a hundredth of an inch, anyway. This is right, and from considerable correspondence of late I am led to believe that Italian bees from various parts of the country, and from colonies that gather little or much honey, all have tongues of practically the same length. Had the tongues of Italian bees from colonies giving the poorest yields of honey been measured on the start, instead of offering prizes for the longest tongues which gathered the most honey, more real facts would have come to light, with less of public deception.

It is always well to go a little slow until assured of the ground upon which we stand, lest some one may be deceived by statements which are made prematurely; the same being premature through our not having investigated till we have gotten at the bottom facts in the case.

Onondago Co., N. Y.

A Short Report—Selling Honey too Cheaply, Etc.

BY MRS. L. HARRISON.

OUR honey is all taken off, and put away nicely (Oct. 25), and I estimate that there is a supply for two families, from our apiary of 40 colonies. Our apiary, prior to this decade of poor seasons, numbered 125 colonies, but the losses each succeeding winter were more than the summer's increase; and this is the condition of apiaries generally in this part of the State.

A grocer who advertises largely announced lately that he had some fine honey of this year's production, which he was selling at 15 cents per pound. Honey was worth 20 cents, but he had a chance to buy 250 pounds cheap, and his customers should have the benefit of it.

When there is a short crop of corn or potatoes, the price goes up, and why should not honey? No fine comb honey should be sold for less than 20 or 25 cents per pound at retail. There has been a steady decrease in the number of colonies, and a less secretion of nectar than formerly.

I think that there are more sources for honey in the city, per acre, than in the country. At almost every home a few flowers are cultivated; lawns are sprinkled frequently with a

hose attached to hydrants, and the modest white clover dots the green. Porches are shaded with Columbine or Maderia vines, which are favorites with bees; there are beds of portulaca, mignonette and other flowers. The city parks have much bloom, and sweet clover, both white and yellow, have pre-empted all unoccupied land. A failure of fall honey has never been reported in this locality.

PREPARING BEES FOR WINTER.

I get everything ready beforehand. I use new sheets of Indian-head muslin every year; tear it up so large that it will extend over the edges of the hive, so that when the caps shut down upon it, it is utterly impossible for a bee to get up into the cap. I pick off all ravellings, iron them smooth, and pile them up on a board. I gather baskets of dry maple leaves. When all was ready on one of our quiet October days, I uncovered the bees, put a Hill's device up on the combs, spread over the sheet, and set on the cap or upper story, poured in a good bed of leaves, and a chaff cushion above them; then the cover with a piece of section between it and the cap, thus making a little crack, so that fresh air will circulate above the packing. This was all done so quietly that the bees were not disturbed, and no smoke was necessary. The chaff cushions have been in use a good many years, so I put in leaves, as chaff is not handy to get.

The hives were all heavy with well-ripened, sealed honey, gathered from sweet clover, goldenrod, Spanish-needles, bonaset, polygonum, and other wild and cultivated flowers.

MULBERRIES.

One year the last of April, I visited the navy yard at Pensacola, Fla., and while there gathered a handful of ripe white mulberries; they were very rich, and so juicy and sweet that they made my fingers sticky. A friend, who was a missionary many years in Turkey, says that in that country they press out the juice, boil it down into a syrup, and call it "honey." The residue—skins and seeds—they dry, and keep to feed their donkeys during the winter.

Peoria Co., Ill.

Questions and Answers.

CONDUCTED BY

DR. C. C. MILLER, Marengo, Ill.

(The Questions may be mailed to the Bee Journal office, or to Dr. Miller direct, when he will answer them here. Please do not ask the Doctor to send answers by mail.—Editor.)

Feeding Bees for Winter Stores.

I got caught in that cold spell, and one colony is short of stores; that is, it has a little over eight pounds of unsealed syrup.

1. Will that unsealed syrup cause trouble?
2. How can I make sugar candy? I made some last winter, but it was so hard the bees could not take it. I made it according to the books.
3. How much candy should I give that colony to carry it through the winter? That is, how many pounds of sugar should I make into candy?
4. Are four Langstroth frames full of honey enough to winter a strong colony?
5. Are forest leaves a good, warm packing?

MINNESOTA.

ANSWERS—1. There is some danger of it, especially if it was fed late. There will be less danger of trouble in the cellar than outdoors.

2. I doubt being able to tell you any better than the books. Two kinds are given, Scholz or Good candy, which is perhaps the better kind, being a stiff dough made by kneading extracted honey into sugar; and the old kind made by evaporating sugar syrup. It is quite possible that your candy was all right. No matter what kind of candy you have, the bees in winter are not likely to take it unless it is very easily within reach. See that the candy is directly over the cluster, or else that it is in a frame hung close beside the cluster so as to touch the bees.

3. Having already 8 lbs. of syrup, 22 lbs. of candy will do for a full colony.

4. Yes, if by "full" you mean bulged out from top to

bottom and sealed out to the lower corners. But as you are likely to find them in the brood-chamber, six or eight would be nearer the mark.

5. Yes, if dry, they are excellent.

Various Questions.

1. Will Italian queens reared from a thoroughbred mother mated to a black drone produce as good honey-gatherers as if mated to an Italian drone?

2. Does it take more honey to winter a colony of Italians than a colony of blacks?

3. Do queens lay during the night?

4. Do the worker-bees work in the hive at night, such as build comb, feeding larvae, etc.?

5. About how much honey does it take to winter a colony of bees in this latitude? Our bees usually start to swarming here about the first of April, if the spring is not late.

SOUTH CAROLINA.

ANSWERS—1. Sometimes they will, and sometimes not. The first cross are generally good, but after that the improvement generally goes backward.

2. You will probably find no difference, if you compare 100 colonies of Italians with 100 colonies of blacks of equal strength. You will find considerable variation, however, in single colonies, whether yellow or black.

3. Yes, indeed.

4. Yes, indeed.

5. I don't know, but I think it is not safe to have a colony go into winter quarters with less than about 30 pounds, unless you expect to feed them in the spring before flowers appear. If I am wrong in this I wish some South Carolinian would correct me?

* The Afterthought. *

The "Old Reliable" seen through New and Unreliable Glasses.

By E. E. HASTY, Sta. B Rural, Toledo, O.

DR. STRICKLAND NOT FOR "MELTLOSE."

I hasten to make amends for a particularly atrocious meanness of my blundering pen. Dr. Strickland was not acting as the friend of meltlose when he sent a sample to the office. More care in reading up the whole thing should have shown me that. I heedlessly, though sincerely, located him on the wrong side of the fence and went on. Monkey at the lever of a 100 H. P. machine is capable of mischief, is he not? Page 611.

THOSE TWIN BRIDES.

Compliments to those twin brides and their grooms on page 721. Doubtless the boys themselves (on a slight inspection) can tell the brides apart. If the rest of the world makes a mistake occasionally, why, that doesn't signify.

FIXING UP OTHER PEOPLE'S LANGUAGE.

And so Dr. Miller wants Prof. Cook and myself to settle matters between us. Might as well ask Kitty and Towser to settle their differences by a little private confab in the back yard! I just keep getting madder and madder all the time. It's just monstrous the way Prof. Pharaoh Cook is trying to compel 100,000,000 people to make bricks without straw! All who speak the English tongue come in contact with certain familiar objects. They have to call them something. Not one in a hundred of all these people can tell which is worm and which is larva—haven't the entomological knowledge required to do it. But here comes Pharaoh and says, "You must, or I'll take your dirty, ignorant lives!" Leastwise, if he doesn't put it as badly as that, he is on the road in that direction—"I'll brand you as disgraceful perverters of the English tongue." If it was only one case, and entomology was the only science extant, we might think of yielding just for the sake of peace in the family. But science has a hundred branches (going to be); and nobody is, or possibly can be, familiar with all; but all, I fear, will have Prof. Cooks that will be emboldened to make similar demands of us, if we do not stand for our rights. Suppose a few hundred astronomers should insist that the entire English public leave off saying "shooting stars" and say "bolides." And what a supreme

ass a geologist would make of himself trying to make everybody use the term "rock" precisely as he uses it! Call out the police and the ambulance. Dear Boss; I'm going to throw the imposing stone!

In some things the rich man has more rights than the poor man; and the learned man has more rights than the unlearned. That may sound shocking to some, but I will grant it freely. But—the right to have a language to express his ideas—a language in which he can express his ideas, without distress, and without annoyance, and without being called a fool—that does not by any means go with the above. That's one of the inalienable rights of man, like "life, liberty, etc." When it comes to that, the college professor is only 1 divided by 100,000,000—same as all the rest of us. He can take his chances with the language as the millions make it; or he can have a private dialect for his own little company—either one; but he can't impose his little dialect on the millions—too big a dog for so small a tail to wag. It would, indeed, be nice if everybody knew everything, and used terms in accordance with his knowledge; but I honestly think it might be well to accept less for awhile. And possibly the command to "Condescend to men of low estate" may reach even to the camps where hats are seen with mortar-board tops. Pages 730 and 698.

UNCAIPPING AND RENDERING.

Quite an idea, that of J. B. Hall's—have the basket of the uncapping-can fit the solar wax-extractor also, and render the wax at once. But I, for one, hardly believe that shading the lower dish will prevent the sun from spoiling the honey. Page 660.

FLOWERS INTOXICATING AND HOLDING BEES.

When only few and rare plants were accused of holding bees by some sort of intoxicant the case sounded stronger than it does now that the attempt is made to accuse the basswood of the same thing. "Don't believe fish-story, too, now," is the frame our minds incline to take. Without much assurance, I rather think that all that the visible facts show is that bees will sometimes "board around" among the flowers. So doing, they save the honey which would be used if they took their meals at home. This, of course, when there is nothing on the range from which a load can be secured. If it is found that some bees snoop it while others are bringing loads rapidly, that, I suppose, would be fatal to my suggestion. There is no intoxicant—nothing but smell—when they spend hours at the screens of the honey-house. May it not be that flowers hold them by smell alone, sometimes? Page 661.

* The Home Circle. *

Conducted by Prof. A. J. Cook, Claremont, Calif.

THE COW.

Is any home circle quite complete without the cow? I would never consent to be without this important adjunct in every home. In this day of food adulteration it is hard to know just what we are eating, but if we have our own cow, and do our own milking, we may be pretty sure on this point.

We are very fond of milk at our house, and none of us complain if a good proportion is richest cream. I take great pleasure in my glass or bowl of milk, and, I believe, as much in seeing the other members of the family as they quaff this pure and unobjectionable beverage. We are certain that in milk there are no impurities. In it, too, we get perhaps as balanced a ration as we can obtain anywhere. It is Nature's own concoction. We never grew so fast as when in our babyhood. Then milk was our exclusive diet. I suppose in milk we have just about the right amount of sugar which has no taint of glucose in it; just the proper proportion of fat, which is certainly one of the most appetizing and wholesome of all the varieties of oleaginous material; and in the caseine or cheese of the milk we have enough and most wholesome albuminoid.

I also like to take care of my own cow and to do my own milking. So many people are content to keep their cows covered with filth, and are so scrupulously careful not to brush or clean them as they commence to draw the milk, that I find it not at all agreeable to patronize the milkman.

My cow must be as neat and clean as my driving horse, and I would not think of commencing to milk until the cow was absolutely clean in all the region about the udder. A private dairyman, whom I know, gets the creamery price for his butter. When asked why, at one of our Farmers' Institutes, he said, "I never milk without thoroughly brushing, and, if necessary at all, thoroughly washing the cows, all about the udders." Neither would I have any one milk my cow who would wet the teats before or during the milking. Wet milking and neatness never ride in the same carriage.

We have just secured a new cow. Five of us—nearest neighbors—share in the milk. Four families own the cow and share equally the expense and the profit. As I have said before, I think such partnership among nearest neighbors tends to harmony, and has more to recommend it than simple economy. Our new cow gives us nearly 20 quarts of milk a day. She does a good lot of eating. I like to see her eat. Of course, she must eat or she could not give us so liberally of her very substance. Where do we have a better example of real, personal sacrifice than we see in the cow? I fancy our cow has a sort of a benignant look in her very eyes. Mrs. Cook remarked only a few minutes ago, "How kindly our cow looks at us; and what a pretty face she has." I bethought me, "Why not? If any one has earned a right to look kindly it is surely one who gives herself, as does our cow, to add to the pleasure and happiness of others."

Our cow has been giving milk only a few days. The springing into action of the great milk-glands has made the udder tender, so that as I draw the milk the parts are irritated, and she raises her foot, often many times, when I am milking, and not always in gentlest fashion. There are two ways to meet this not wholly agreeable condition of things. I could use my boot or stool, and possibly she might be cowed into quietness. No doubt in doing this, even though I did succeed in quieting her, I should do it at the sacrifice of milk. Rough treatment or unkind words and a full flow of milk never go together. Many times, generally, I think I would fail to check the uneasiness, and if my cow was of nervous temperament, it would very likely ruin her.

The other course is to milk very gently, and perhaps very slowly, and thus not hurt even the sensitive milk-glands. I hardly need say that this is the way that I have proceeded, and I am very happy to state that it has worked like a charm. I am sure, too, that I am getting the full yield of milk, and just as sure that I am in no danger of ruining the cow.

I wonder if we all realize that we are never violent with our animals, especially with our cows, except at a great loss. We hardly realize how delicately sensitive our cows are to any disturbance. A large dairyman told me a few days since that he never changed his cows from one pasture to another without losing several pails of milk; and this even though he put them in a better pasture. The disturbance attending the change was what reduced the milk flow. The dog, the milk-stool, and the boot too often bring the same result.

Apropos to the above is the too common habit of pounding a cow because she does not "give down" her milk. The philosophy of yielding or withholding the milk is this: The milk is in very numerous small tubes, which are thickly set in muscular tissue. These small muscles are of the unstriated type, and are entirely beyond the control of the will. Thus, we are absolutely sure that the cow has no direct control of the matter. Rough treatment, which will produce a nervous shock, may effect to press the milk down into the teats. It will just as likely act the other way, and we have made a bad matter worse, and done a beastly, mean thing. In all such cases stooping or kicking are strictly in order; but the cow should not be the recipient.

CATS AND DOGS.

I don't mean cats and dogs in the sense of "scraps" in the home. Oh! that parents who suffer ill-will, fault-finding, family-fars to invade the sacred precincts of the home could realize their terrible mistake! They are bequeathing a frightful legacy to the precious ones entrusted to their care. Divorce has always seemed to me one of the blackest pages in our social history. Separation between the chief partners of the home circle is nearly as bad. Yet, I quite agree with Mrs. Wells, in the October North American Review, "The daily spectacle of a discordant home is worse for the child than the known separation of its parents." Cats and dogs, then, as used to designate fierce word-battles, where word-fights have no business, is not my theme. I mean real cats and dogs.

We have two tiger cats. We all like them, and if purring is a sign of contentment—and who can doubt it?—then our cats are not pining for a new home. No one would wonder at this, if he should see the great basin of freshest, sweetest milk that I give them twice daily, as I come always attended by them from barn to house. In fact, they always watch me as I milk. So I have to be neat and particular, as I am always watched. My wife and daughter insist on this full milk ration. I suppose they are right in thinking nothing too good for our cats. I often hint to them that if I ever do get jealous of those cats it will surely not be without provocation.

One of these cats is a beauty. He is as boldly striped as a veritable tiger. Everybody praises "Toots." "He is such a beauty." Toddles is more plain in garb. Few visitors discourse on his handsome fur cloak. I smile to see how Mrs. Cook and daughter take his part, and warm up as they portray his good points. These cats are treasures. Mice used to run riot in the barn, and took too generous toll from hay and meal bag. Now I never see any mice except as Toots or Toddles come to show me one that specially pleases them, and, like well brought up cats, wish to share the pleasure with me.

Even a better use than this is the pleasure they give the dear ones of our home circle. It is good for us to lavish attention and care even on a feline member of the family. And I am sure that loving them insures more love to those of the household more deserving of love. Neither do our cats disturb any one of our neighbors. Indeed, they are fondly petted by all.

I don't feel so about dogs. I wouldn't have one. They do not catch mice, and are only valuable as pets. And are

they not too often a nuisance to all the neighbors? No hour of night is sacred against their vociferous yelps. And how few are too well bred to pitch wildly out at the passing carriage or equestrian? Unless we can get real gentlemen dogs—and they are rare in California—let us replace every dog on the place with a good, handsome cat.

DIVORCE THE LAWN AND TREES AND SHRUBS.

What are so exquisitely graceful as date-palms—the Phoenix canariensis? They are great, living fountains of finest green. A neighbor had one right on the lawn. It had no business there. An open lawn is too beautiful a feature of the landscape to be invaded even by handsomest tree or shrub. Again, the grass seems to have learned this, and proceeds at once, upon occasion, to throttle the very life from any invader. Thus it was that this date-palm was yellow and sickly. Why, my date-palm, almost near enough to shake hands with the other, grew more in three years than did that one in more than double the time. The grass wished the water and the fertility, and took it, and the poor palm could only turn yellow—not green—with envy.

A new neighbor has purchased the place. As the palm was on the edge of the lawn, or to one side, she dugged about it and put the too-greedy grass-blades to route. And, presto! the palm doesn't look like the same plant at all. The sickly yellow is replaced with brightest green, and it has grown more in one short year than in several long previous ones. It just laughs now, and were it not that its strong roots had gotten such a hold, I veritably believe it would dance.

Let us all keep trees and shrubs away from the lawns.

THE MODERN FARMER & BUSY BEE.

EMERSON TAYLOR ABBOTT, Editor.

Send us 10 cents and the names and addresses of five farmers and we will send you the paper one year.

A live, up-to-date Farm Journal with a General Farm Department, Dairy, Horticulture, Livestock, Poultry, Bees, Veterinary, Home and General News. Edited by one who has had practical experience in every department of farm work. To introduce the paper to new readers, it will be sent for a short time to New Subscribers, one year for 25 cents. Sample copies free. Best Advertising Medium in the Central West. Address,

The Bee in Law.

Bees are *fera natura*, i. e., wild by nature, and classed with such wild animals as have what is called *animus revertendi*, or a usual habit of returning whence they have escaped. During this temporary absence they remain the property of the original owner. (2 Kent, Com. 348). The law, as Blackstone says, "extends this possession further than the mere manual occupation; for my tame hawk that is pursuing his quarry in my presence, though he is at liberty to go where he pleases, is nevertheless my property; for he hath *animus revertendi*. So are my pigeons, and bees that are flying at a distance from their home, and likewise the deer that is chased out of my park or forest, and is instantly pursued by the keeper or forester; all which remain still in my possession, and I still preserve my qualified property in them. But if they stray without my knowledge, and do not return in the usual manner, it is then lawful for the stranger to take them." (2 Blackstone, Com. 342).

So, in the civil law, Gaius says: "In respect of such animals as are in the habit of going and returning, as pigeons and bees and deer, which are accustomed to go into the woods and fields and come again, we have this traditional rule: That if they cease to have the intention of returning they also cease to be ours, and become the property of the first taker; now they appear to cease to have the *animus revertendi* when they have discontinued their habit of returning. This theory may be compared to the rights of property in animals at common law only when *animus revertendi* is induced by artificial means, such as taming them or offering them food and shelter, but not to immigrating animals which return from natural causes. The highest authority is that the only ownership in them is *ratum soli*. In consideration of the fact that the character of the forest allows every freeman to be entitled to the honey found within his own woods, affords great countenance to the doctrine that a qualified property may be had in bees in consideration

Langstroth on... The Honey-Bee

Revised by Dadant—1900 Edition.

This is one of the standard books on bee-culture, and ought to be in the library of every bee-keeper. It is bound substantially in cloth, and contains over 500 pages, being revised by those large, practical bee-keepers, so well-known to all the readers of the American Bee Journal—Chas. Dadant & Son. Each subject is clearly and thoroly explained, so that by following the instructions of this book one cannot fail to be wonderfully helped on the way to success with bees.

The book we mail for \$1.25, or club it with the American Bee Journal for one year—both for \$1.75; or, we will mail it as a premium for sending us THREE NEW subscribers to the Bee Journal for one year, with \$3.00.

This is a splendid chance to get a grand bee-book for a very little money or work.

✧ REVERSIBLE WALL MAP ✧ — OF THE — **UNITED STATES AND WORLD,**

WITH SPECIAL INSET MAPS OF

China, Cuba, Porto Rico, The Philippines, Hawaii, and Alaska,

Especially prepared to meet the demand for a first-class map that will give a quick, general idea of location of events the world over, and particularly to the United States and our territorial possessions. **Very useful in every Home and Office.**

66 x 46 INCHES IN SIZE.

ELEVEN BEAUTIFUL COLORS.

**Best and Most Necessary Map
Ever Issued.**

**No Home or Business House
should be without it.**

The Plates

are works of art. The engraving is plain, bold, and decisive. The color work is elegantly contrasted, but not gaudy.

Perfection and Artistic Elegance

a salient feature of this map not approached by any similar publication.

A Marginal Index

is one of the invaluable features.

It gives an alphabetical list of countries, their location on map, style of government, area, products, minerals, imports, exports, etc.

**It has been pronounced a
Photograph of the World**

One side shows a grand map of our great country, with **counties, railroads, towns, rivers, etc., correctly located.** The other side shows an equally good map of the world. Statistics on the population, cities, capitals, rivers, mountains, products, business, etc., a veritable photograph of the UNITED STATES AND WORLD.

The map is printed on heavy map paper and is mounted on sticks ready to hang. Edges are bound with tape.

1901 EDITION.—Every reader should consult it every day. The plates show all the new railroad lines and extensions, county changes, etc. Especial attention is given to the topography of the country; all the principal rivers and lakes, mountain ranges and peaks are plainly indicated. The leading cities and towns are shown, special attention being given to those along lines of railroads. The Canadian section of the map gives the provinces of Ontario, Manitoba, and British Columbia, with nearly all of Quebec and New Brunswick, the county divisions being clearly marked. The Southern portion of the map includes the Northern States of the Republic of Mexico, and the Bahama Islands.

On the reverse side is the Library Map of the World. The largest and most accurate map on Mercator's Projection ever produced. The political divisions are correctly defined and beautifully outlined in colors. The ocean currents are clearly shown and named. Ocean steamship lines with distances between important ports are given. A marginal index of letters and figures enables one easily to locate every country in the world. A series of short articles in alphabetical order is printed around the border of this map in large, clear type, containing valuable information concerning agricultural, mining, and manufacturing statistics, also the value of imports and exports in dollars. The area, population, form of government, and chief executive of every country in the world is given up to date, also the names of the capitals and their population. **The Inset Maps** are elegantly engraved and printed in colors. They are placed in convenient positions around the United States map, and will be invaluable to every person desiring a plain understanding of our possessions. An inset map of China on the World side of map adds to its value.

on one sheet, all for only \$1.50, sent by mail or prepaid express; or we will forward it free as a premium for sending us **Three New Subscribers** at \$1.00 each; or for \$2.00 we will send the Map and the American Bee Journal for one year. Address,

GEORGE W. YORK & CO.,

144 & 146 Erie Street, CHICAGO, ILL.

OUR NEW CATALOG, describing and listing the **FINEST LINE OF BEE-KEEPERS' SUPPLIES IN THE WORLD**, will be ready about the first of the year. If you have not been receiving a copy annually, send us your name and address and one will be mailed you free. Prices will be same as last season with the exception of the narrow, plain sections with no bee-ways, which will be 25 cents per thousand less.

BEST

Extracted Honey For Sale

ALL IN 60-POUND TIN CANS.

Alfalfa Honey

This is the famous White Extracted Honey gathered in the great Alfalfa regions of the Central West. It is a splendid honey, and nearly everybody who cares to eat honey at all can't get enough of the Alfalfa extracted.

Basswood Honey

This is the well-known light-colored honey gathered from the rich, nectar-laden basswood blossoms. It has a stronger flavor than Alfalfa, and is preferred by those who like a distinct flavor in their honey.

Prices of Alfalfa or Basswood Honey:

A sample of either, by mail, 10 cents, to pay for package and postage. By freight—two 60-pound cans of Alfalfa, 8 cents per pound; four or more cans, 7½ cents per pound. **Basswood Honey**, ½ cent more per pound than Alfalfa prices. Cash must accompany each order. You can order half of each kind of honey, if you so desire. The cans are boxed. This is all

ABSOLUTELY PURE HONEY

The finest of their kinds produced in this country.

Read Dr. Miller's Testimony on Alfalfa Honey:

I've just sampled the honey you sent, and it's prime. Thank you. I feel that I'm something of a heretic, to sell several thousand pounds of honey of my own production and then buy honey of you for my own use. But however loyal one ought to be to the honey of his own region, there's no denying the fact that for use in any kind of hot drink, where one prefers the more wholesome honey to sugar, the very excellent quality of alfalfa honey I have received from you is better suited than the honeys of more marked flavor, according to my taste.

Nichols Co., Ill.

C. C. MILLER.

Order the Above Honey and then Sell it.

We would suggest that those bee-keepers who did not produce enough honey for their home demand this year, just order some of the above, and sell it. And others, who want to earn some money, can get this honey and work up a demand for it almost anywhere.

GEORGE W. YORK & CO., 144 & 146 Erie St., Chicago, Ill.

of the property of the soil whereon they are found.

IDENTITY.

One of the chief difficulties in reclaiming bees is in the almost impossible identification thereof. Many curious cases of doubtful or disputed identity might be cited to illustrate the singular fortuitous resemblance between bees, not only in their general appearance, but also in the strain or accidental mark. Positive recognition of peculiar habits and working of bees is too difficult to suffice to prove their identity. Courts judicially recognize photography as a proper means of identification of the thing in dispute; but there is no case or record, so far as we have been able to discover, where a claimant has been able to reclaim his bees by means of photography. Neither can bees be identified or proven by the concurrence of their several characteristics. This proof is too remote, and the question of identity is for the jury. The court can not presume identity of bees.

TRANSPORTATION OF BEES; CONTRACT OF CARRIAGE

The exact character of the contract for the carriage of animals has been the subject of much judicial discussion. The prevailing opinion, however, is that common carriers are also insurers against all losses except those resulting from the acts of God or the public enemy, or from the peculiar nature of the property carried. Though it may be optional with railway companies whether they will accept the full responsibility of transporting bees, yet if they do so without any express restriction, they are liable as common carriers. But they may, for a less hire, agree simply to transport bees, furnish cars, etc.; and if the shipper and owner of the bees agrees to the lower rate, he can not hold them as common carriers. For a given reward they prefer to become his carrier; for a less reward they prefer to furnish the necessary means that the owner of the bees may be his own carrier (*Kimball vs. Ry. Co.*, 26 Vt., 247). In the case of *Birly v. Deemar*, 54 Fed. R., 718, the United States court held that, when a vessel struck a hidden obstruction and filled with water, and a cabin containing bees floated to the shore, but no effort was made by the master to use care in saving them, the steamboat line was held liable for damages to them, though the vessel was insured and was abandoned to the underwriters as a total loss.

BEEES THE SUBJECT OF LARCENY.

Bees in the possession of the owner are the subjects of larceny, says the Indiana Supreme Court in *State v. Murphy*, 8 Blackf., 498. Further, the court holds that, when bees are in the possession of any person, they are the subject of larceny. Much depends upon what constitutes possession. Generally it is

regarded that the owner of the soil upon which the bees may be found is the possessor thereof. While the rights to animals *ferre natura*, as between the owner of the soil and others, have been fairly settled by a considerable series of cases, the relative rights of parties, both of whom acknowledge the superior rights of the owner of the soil, seem never to have been precisely described. But in a recent Rhode Island case (*Isaiah v. Isaac* 15 R. I. 353), the plaintiff, without permission, placed a hive of bees upon the land of a third person. The defendant, also a trespasser, removed the bees and honey which had collected in the hive. The court found that there was no cause of action, holding that neither plaintiff nor defendant had any title or right to possession to the bees or to the honey. It needs scarcely follow that a trespasser can not maintain, on the basis of mere possession, an action against a later trespasser. There may be some possible doubt in a case of this kind where a person has reduced the bees to possession by collecting the bees in a hive, and left them temporarily on the land or another; and if so it would seem to give him actual physical possession sufficient for an action against one who removed them. But about the honey which the bees had collected while on the soil of a third person, there would be less doubt; but, strange to say, in no case which we have examined does the question seem to have been discussed, much less decided, as to how far the law of animals and bees *ferre natura* applies to their produce, such as eggs or honey. The reason on which the law about the animals is founded is wholly inapplicable to the honey; but the Rhode Island case tacitly assumes that no distinction is to be drawn. Hence, as a dictum, it would appear that the honey, at least, belonged to the owner of the soil.

Bees are likened unto wild animals belonging to no one so long as they are in their wild state, and property in them is acquired by occupancy, hiving, and reclaiming only, and are not the subject of larceny unless they are in the owner's custody, as in a hive, beehouse, or otherwise confined, and within the control of the possessor or owner.—R. D. FISHER, in *Gleanings in Bee-Culture*.

Fair Honey Crop.

In our locality we have very changeable weather in winter—from extremely cold to warm. We seldom have over one week at bees do not fly, if left on the summer stands. There has always been a question in my mind whether it would be an advantage to winter bees in a cellar under such conditions or not. Our honey crop was fair the latter part of the season. Bee-keepers in this locality do not read bee-papers; one reported foul brood, which, on inquiry, proved to be broad in the super.—C. W. SNYDER.

Garfield Co., Utah, Nov. 29.

Bees Worked on Strawberries.

I was very busy the past summer, in fact, I believe I never worked harder in my life; but it has been a good year for me. I had \$500 worth of strawberries, and they were nice, big ones, and fine flavored—should have liked a visit from you in June. My bees did fairly well, but I did not have time to attend to them at the proper time. My best colony filled 10 frames and 55 sections. I doubled up two colonies in 10-frame dovetailed hives, put two supers between, and after reducing them for winter I tried to give the hive, but my scales weigh only 60 pounds, and I put a brick on for a weight besides, and as this would not weigh them I think they are all right for winter. My lightest colony weighs 47 pounds, being the only colony my scales will weigh, so I do not think I will have to feed for this winter. Bas-wood bloomed very

Great Combination Subscription Offers.

Combination and concentration in business are the magic watchwords of the age in which we live. Why should it not be applied to the matter of subscriptions to magazines and periodical literature in general? We believe it is a wise move, especially when it is in the line of economy for the reading public. Now, if we can be the means of saving our subscribers several dollars a year on their reading matter, and at the same time help them to the best literature published to-day, we shall feel that we are doing a good thing, indeed.

We have entered into an arrangement whereby we can furnish the following excellent periodicals at greatly reduced prices:

	Regular price.	THE DOLLAR PAPERS.	Regular price.
Review of Reviews	\$2.50	Cosmopolitan Magazine	1.00
Current Literature	3.00	Frank Leslie's Popular Monthly	1.00
New England Magazine	3.00	The Household	1.00
Leslie's Weekly	4.00	Good Housekeeping	1.00
North American Review	5.00	The Designer	1.00
		Success	1.00

PLEASE NOTICE that in all combinations Success and the American Bee Journal must be included.

Here is our List of Liberal Offers:

American Bee Journal and Success, \$1.75.

with any one of the above dollar magazines (3 periodicals)	\$2.50
with any two of the above dollar magazines	3.00
with any three of the above dollar magazines	3.50
with the Review of Reviews (new)	3.00
with Current Literature (new)	3.00
with New England Magazine	3.00
with Review of Reviews (new) and any one of the dollar magazines	3.50
with Leslie's Weekly	3.75
with Review of Reviews (new) and Leslie's Weekly	4.25
with North American Review (new) and Review of Reviews (new)	5.00

If a renewal subscription is wanted for the Review of Reviews, Current Literature, or the North American Review, add \$1.00 for each renewal subscription to the combination prices named above. On all the other combinations a renewal counts the same as a new subscription.

No foreign subscribers can take advantage of these combination offers.

We shall be pleased to have our readers examine carefully the above list, and send us their subscriptions. Address,

BEE-BOOKS

SENT POSTPAID BY

George W. York & Co.

Chicago.

Bees and Honey, or Management of an Apiary for Pleasure and Profit, by Thomas G. Newman.—It is nicely illustrated, contains 160 pages, beautifully printed in the highest style of the art, and bound in cloth, gold-lettered. Price, in cloth, 75 cents; in paper, 50 cents.

Langstroth on the Honey-Bee, revised by Dadant.—This classic in bee-culture has been entirely re-written, and is fully illustrated. It means of everything relating to bees and bee-keeping. No apiarist library is complete without this standard work by Rev. L. L. Langstroth—the Father of American Bee-Culture. It has 530 pages, bound in cloth. Price, \$1.25.

Bee-Keepers' Guide, or Manual of the Apiary, by Prof. A. J. Cook, of the Michigan Agricultural College.—This book is not only instructive and helpful as a guide in bee-keeping, but is interesting and thoroughly practical and scientific. It contains a full delineation of the anatomy and physiology of bees—460 pages, bound in cloth and fully illustrated. Price, \$1.25.

Scientific Queen-Rearing, as Practically Applied, by G. M. Doolittle.—A method by which the very best of queen-bees are reared in perfect accord with Nature's way. Bound in cloth and illustrated. Price, \$1.00.

A B C of Bee-Culture, by A. J. Root.—A cyclopedia of 400 pages, describing everything pertaining to the care of the honey-bees. Contains 200 engravings. It was written especially for beginners. Bound in cloth. Price, \$1.20.

Advanced Bee-Keeping, Its Methods and Management, by W. Z. Hutchinson.—The author of this work is a practical and entertaining writer. You should read his book; 90 pages, bound in paper, and illustrated. Price, 50 cents.

Rational Bee-Keeping, by Dr. John Dzierzon.—This is a translation of his latest German book on bee-culture. It has 350 pages, bound in paper covers, \$1.00.

Bienen-Culture, by Thos. G. Newman.—This is a German translation of the principal portion of the book called "Bees and Honey." 100-page pamphlet. Price, 25 cents.

Bienenzucht und Honigerwerb, nach der neuesten methode (German) by F. E. Eggers.—This book gives the latest and most approved methods of bee-keeping in an easy, comprehensive style, with illustrations to suit the subject. 50 pages, board cover. Price, 50 cents.

Bee-Keeping for Beginners, by Dr. J. P. H. Brown, of Georgia.—A practical and complete treatise on the honey-bee, giving the best modes of management in order to secure the most profit. 100 pages, bound in paper.

Bee-Keeping for Profit, by Dr. G. L. Tinker.—Revised and enlarged. It details the author's "new system, or how to get the largest yield of comb or extracted honey." 80 pages, illustrated. Price, 25 cents.

Apiary Register, by Thomas G. Newman.—Devotes two pages to a colony. Leather binding. Price, for 50 colonies, \$1.00; for 100 colonies, \$1.25.

Dr. Howard's Book on Foul Brood.—Gives the McEoy Treatment and reviews the experiments of others. Price, 25 cents.

Winter Problem in Bee-Keeping, by G. R. Pierce.—Result of 25 years' experience. 30 cts.

profusely this year, but the bees did not look at it. They worked on the strawberries for the first time this year. **LEWIS LAMKIN.** Woodbury Co., Iowa, Oct. 28.

The National Association.

I am a bee-keeper, fruit-grower and farmer. I have about 20 colonies of bees, and so far have succeeded, with the help of the "Old Reliable," to sell a few hundred pounds of nice comb honey every year, besides having it on the table at every meal, as my family and I are very fond of it. I have sold all my honey the last few years to the same store-keeper for 12 1/2 cents per pound, and next year's crop is ordered before this year's is sold.

Now for a question: Would the National Bee-Keepers' Association protect and help a member if he were swindled by a commission man to whom he had sold his farm products, such as apples, prunes, etc., the same as when he is swindled out of a shipment of honey? I have had no trouble so far, but I think precaution is better than cure.

NOV. 17, F. FLYCKER-ER.

Lewis Co., Wash., A. F.

[Yes, we think the Association would do all it could for its members to get justice in such a case, though honey-deals are its specialty.—EDITOR.]

Hoping for a Good Wintering.

Although I am well advanced in years, and, unfortunately, an invalid, I manage to attend to my little apiary. With severe losses and extra labor-cost during the past month, feeding and fighting bee-diseases, etc., I am still "in it," and expect to stay with it, with the American Bee Journal as a welcome visitor and guide.

The first rain of the approaching winter season fell here Oct. 27, and again Nov. 9 and 11, and we are all hoping for a good wintering about the coming holidays. I am wintering my bees on the summer stands, but, as a precaution on account of the high altitude and occasional cold snaps, they are packed a little warmer.

GUSTAV VOSS.

Riverside Co., Calif., Nov. 16.

A Report—Red Clover.

My bees did fairly well the past season, averaging from 25 to 55 two-pound sections of nice comb honey per colony, spring count. I started the season with 24 colonies, increasing to 36, and two swarms left for the woods. I have sold nearly all my honey in the home market. My bees worked on red clover as much as on the white. Clover is in good condition this fall—we are getting plenty of rain, and things are booming. I would like some of the "wise heads" to tell me if red clover yields nectar every year. My experience says not, here in Iowa, or is it locality? **FERRY SCOTT.** Page Co., Iowa, Nov. 12.

Poor Prospect for White Clover.

I do not know what we will do for honey next year, as the white clover has been killed by the drought. No, I honey here is worth 15 cents per pound by the case. I sold all I had at that price. I had no swarms to speak of this year. I like the swarm on the old stand, and remove the old colony to a new location at once, the swarm catching all the field-bees; by putting the super from the old colony on the new I have it full of honey in a few days, if the flow is good. Bees went into winter quarters in good condition this fall. Although I can't agree with it in everything, I do not see how I could get along without the American Bee Journal. **J. M. MORRIS.** Cass Co., Mo., Nov. 17.

Favors the Honey-Extractor.

The honey-extractor is an article little used by farmer bee-keepers and many others who keep but a few colonies. Yet a good extractor is one of the very necessary things every bee-keeper should have, even if one has

but a half-dozen colonies. In most apiaries there are some colonies that will produce little or no honey if run for comb exclusively. Some colonies seem determined not to work in sections. If such colonies were at once given plenty of extracting-combs they would commence filling them immediately, and prove much more profitable than if compelled to work in sections. "Locality" may "play its part" in this case, as it does in many other instances. In many rural districts, where but few bees are kept, and where there are no large producers, extracted honey brings nearly or quite as much as comb—these are the places where the honey-extractor should be doing duty. If our large producers could get nearly as much for extracted as for comb honey, I don't think they would do very much puttering with sections.

Hampshire Co., Mass. A. E. WILBUTT.

CONVENTION NOTICES.

Vermont.—The State Horticultural Society and the Vermont Bee-Keepers' Association, will hold a joint meeting at Vergennes, Dec. 17 and 18, 1901. M. F. CRAM, Sec.
W. Brookfield, Vt.

New York.—There will be a bee-keepers' convention (annual) held in Canandaigua, N. Y., by the Ontario Co., N. Y., Bee-Keepers' Association, Dec. 12 and 13, 1901.
Naples, N. Y. ERIDEMANN GREENER, Sec.

Michigan.—The Michigan State Bee-Keepers' Association will meet in convention at Petoskey, Jan. 1 and 2, 1902. This promises to be the most largely attended meeting of the Association in years. You are invited to attend. Reduced rates on all railroads; tickets can be bought Dec. 30 and Jan. 1, good to return not later than Jan. 4. There will be no set program, but another of our "open congress" meetings. Those who have attended in the past know what that means, and those that don't should come and find out. A novel design for badge has been ordered in honor of "Petoskey."

—THE— The Bee-Keeper's Guide;

Or, Manual of the Apiary,

—BY—

PROF. A. J. COOK.

460 Pages—16th (1899) Edition—18th Thousand—\$1.25 postpaid.

A description of the book here is quite unnecessary—it is simply the most complete scientific and practical bee-book published to-day. Fully illustrated, and all written to the most fascinating style. The author is also too well-known to the whole bee-world to require any introduction. No bee-keeper is fully equipped, or his library complete, without THE BEE-KEEPER'S GUIDE. This 16th and latest edition of Prof. Cook's magnificent book of 460 pages, in neat and substantial cloth binding, we propose to GIVE AWAY to our present subscribers, for the work of getting NEW subscribers for the American Bee Journal.

Given for TWO New Subscribers.

The following offer is made to PRESENT subscribers only, and no premium is also given to the two NEW subscribers—simply the Bee Journal for one year:

Send us TWO NEW SUBSCRIBERS to the Bee Journal (with \$2.00), and we will mail you a copy of Prof. Cook's book FREE as a premium. Prof. Cook's book alone sent for \$1.25, or we club it with the Bee Journal for a year—both only \$1.75. But surely anybody can get only TWO NEW SUBSCRIBERS to the Bee Journal for a year, and thus get the book as a premium. Let every body try it. Will YOU have one?

40—49A1t

HONEY AND BEESWAX MARKET QUOTATIONS.

CHICAGO, Nov. 19.—Honey is selling fairly well at about the prices that have prevailed for the last 2 months, viz: choice grades of white comb honey, 14¢ to 15¢; good to No. 1, 14¢; and light amber, 13¢, with darker grades, 12¢. Extracted, white, 5¢ to 6¢; amber, 5¢ to 5½¢, according to quality, flavor and package. Beeswax good demand at 2¢.

R. A. BURNETT & CO.

CINCINNATI, Oct. 25.—The honey market is rather dull on account of the warm weather. Extracted sells only for 10¢ to 11¢ per lb. from 50¢ to 60¢; better grades alfalfa water-white from 60¢ to 70¢; white clover from 60¢ to 65¢. Fancy white comb honey sells from 13¢ to 15¢.

C. H. W. WEBER.

ALBANY, N. Y., Oct. 25.—Honey in good demand now, as the market is satisfactory time to sell. Grocerymen are stocking up and will buy lines, when late they only buy enough to piece out. Fancy white comb, 15¢ to 16¢; mixed, 14¢ to 15¢; buckwheat, 12¢ to 13¢. Extracted, white, 6¢ to 7¢; mixed, 6¢ to 6½¢.
H. R. WRIGHT.

OMAHA, Oct. 25.—New comb honey is arriving by express in small quantities from Iowa and Colorado, and selling at \$3.50 per case, in a retail way. California extracted honey is being offered carlots at 4½¢ to 4¾¢ per pound, f.o.b. California shipping-points, but we have not heard of any sales having been made thus far. The production of extracted honey seems to be quite large this year in Colorado, Utah and California.
PEYCKE BROS.

NEW YORK, Nov. 8.—Comb honey is in good demand, and the market is not overstocked, receipts are sufficient to supply the demand. Fancy white sells at 15¢, with an occasional sale at 16¢ for attractive lots. No. 1, white, at 14¢; No. 2, at 13¢; fancy buckwheat, 11¢ to 11½¢; No. 1 and 2 at from 10¢ to 10½¢. Extracted honey is quiet at from 6¢ to 6½¢ for white, and 5½¢ to 5¾¢ for amber. Very little demand for dark at 5¢ to 5½¢. Beeswax quiet at from 2½¢ to 2¾¢.
HILBERT & SEIGLESEN.

BOSTON, Nov. 21.—The demand for honey is easing up, somewhat due in part to the holiday season at which time it is quite neglected.

Our market at the present time runs for strictly fancy in cartons: No. 1, 14¢ to 15¢; No. 2, 12¢ to 13¢; Extracted, light amber, 10¢ to 11¢; dark, 9¢.
BLAKE, SCOTT & LEE.

DES MOINES, Oct. 25.—There is very little doing here in new crop of honey. Some small lots of near-by produced comb honey are on the market and selling in a retail way at \$3.50 to \$3.75 per case. We do not look for much trade in this line before Sept. 1. Our market does not consume a great deal of extracted honey.
PEYCKE BROS. & CHANLEY.

DETROIT, Oct. 25.—Fancy white comb honey, 14¢ to 15¢; No. 1, 13¢ to 14¢; no dark to quote. Extracted, white, 6¢ to 7¢. Beeswax, 2½¢ to 3¢.
M. H. HUNT & SON.

SAN FRANCISCO, Nov. 13.—White comb, 10¢ to 12¢; amber, 7¢ to 9¢; dark, 6¢ to 7¢. Extracted, white, 5¢ to 6¢; light amber, 4½¢ to 5¢; amber, 4¢ to 5¢.

Market is moderately firm at prevailing values, which remain quotable about the same week ago. There is considerable doing, both on foreign and local account. A shipment of 1,000 cases extracted went forward the past week per sailing vessel for England. A steamer took 107 cases for Holland.

KANSAS CITY, Oct. 25.—Up to the present time only small lots of new comb have been seen on the market, and these met with ready sale on the basis of 15¢ per pound for fancy white. For next week heavier receipts are expected and quotations are likely to advance 1¢ per case for large lots, which will be equal to about 14¢ to 14½¢; the demand being quite brisk, a firm market is anticipated. Inquiries for extracted are a little more numerous, but large buyers still seem to have their ideas too low. In a small way 5½¢ to 6¢ is quotable.

PEYCKE BROS.

A New Bee-Keeper's Song—

"Buckwheat Cakes and Honey"

Words by EUGENE SECOR.

Music by GEORGE W. YORK.

This song was written specially for
the Buffalo convention, and was sung
there. It is written for organ or piano,
as have been all the songs written for
bee-keepers. Every home should have
a copy of it, as well as a copy of

"THE HUM OF THE BEES in the APPLE-TREE BLOOM"

Written by

EUGENE SECOR and DR. C. C. MILLER.

PRICES—Either song will be mailed
for 10 cents (stamps or silver), or both
for only 15 cents. Or, for \$1.00 *strictly*
in advance payment of a year's sub-
scription to the American Bee Journal,
we will mail both of these songs free,
if asked for.

Texas Bee-Keepers.

New Branch Office. We beg to announce the opening of a branch office and warehouse at
438 W. Houston St., San Antonio, Texas. Rates of transportation from
Medina in less than car-load lots are high, and it takes a long time for a local shipment to
reach Southern Texas points.

**Low Freight and
Quick Delivery.**

**San Antonio as a
Shipping-point.**

To secure these two necessary advantages—low freight and quick de-
livery—and to be better prepared to serve the interests of our Texas
friends, is our reason for establishing this new branch office. No other
point in Southern Texas is better adapted to serve as a distributing point
than San Antonio. It has four great railroads—the Southern Pacific R. R. east and West—the
International and Great Northern R. R. from Laredo up through San An-
tonio and Central Texas, the San Antonio and Arkansas Pass R. R., and
San Antonio and Gulf R. R. It also has the American, Wells-Fargo and
Pacific Express Companies.

Our Managers.

We have secured as managers Mr. Udo Toepperwein, formerly of Leon
Springs, and Mr. A. Y. Walton, Jr., both of whom are well known to the
bee-keepers of South and Central Texas. They are also thoroughly familiar with practical
bee-keeping and all matters associated with it, and any orders sent to this branch will receive
prompt, careful attention.

Our Goods.

As usual our motto is to furnish the best goods of the most approved pattern.
We do not undertake to compete in price with all manufacturers. Bee-keepers
have learned that it does not pay to buy cheap supplies, for a saving of 10 cents on the first
cost of a hive may be a loss of many times this amount by getting poorly made and ill-fitting
material. Every year brings us many proofs that our policy of "the best goods" is a correct
one.

Our Catalog.

Very few changes in prices will be made in our new catalog, so do not delay
your order, but send it at once. You will be allowed a refund if lower prices
are made, and in case of higher prices ruling in the new catalog, if any, you will secure the
benefit by ordering now. Catalog and estimates may be had by applying to the address given
below.

Our Invitation.

Whenever you visit San Antonio you are invited to call at our office and
make it your headquarters. Here you will find a display of Apianary Sup-
plies not equaled elsewhere in Texas. You will also find on file the leading bee-journals to
pass pleasantly your leisure time.

Spanish Catalog.

Some of you may read Spanish, or have a bee-keeping friend who does.
If so, call for our Spanish catalog. It's sent free.

MEMBERSHIP DUES, \$1.00 a year.

If more convenient, Dues may be sent to the office of the American Bee Journal, when they will be forwarded to Mr. Secor, who will mail individual receipts.

A Celluloid Queen-Button is a very pretty thing for a bee-keeper or honey-seller to wear on his coat-lapel. It often serves to introduce the subject of honey, and frequently leads to a sale.

NOTE.—One reader writes: "I have every reason to believe that it would be a very good idea for every bee-keeper to wear one [of the buttons] as it will cause people to ask questions about the busy bee, and may a conversation thus started would wind up with the sale of more or less honey; at any rate it would give the bee-keeper a superior opportunity to enlighten many a person in regard to honey and bees."

The picture shown herewith is a reproduction of a motto queen-button that we are furnishing to bee-keepers. It has a pin on the underside to fasten it.

Price, by mail, 6 cents; two for 10 cents; or 6 for 25 cents. Send all orders to the office of the American Bee Journal.

BEST Extracted Honey For Sale

ALL IN 60-POUND TIN CANS.

**Alfalfa
Honey**

This is the famous White Extracted Honey gathered in the great Alfalfa regions of the Central West. It is a splendid honey, and nearly everybody who cares to eat honey at all can't get enough of the Alfalfa extracted.

**Basswood
Honey**

This is the well-known light-colored honey gathered from the rich, nectar-laden basswood blossoms. It has a stronger flavor than Alfalfa, and is preferred by those who like a distinct flavor in their honey.

Prices of Alfalfa or Basswood Honey:

A sample of either, by mail, 10 cents, to pay for package and postage. By freight—two or more 60-pound cans of Alfalfa, 7½ cents per pound. Basswood Honey, ½ cent more per pound than Alfalfa prices. Cash must accompany each order. You can order half of each kind of honey, if you so desire. The cans are two in a box, and freight is not prepaid.

Order the Above Honey and then Sell It.

We would suggest that those bee-keepers who did not produce enough honey for their home demand this year, just order some of the above, and sell it. And others, who want to earn some money, can get this honey and work up a demand for it almost anywhere.

GEORGE W. YORK & CO., 144 & 146 Erie St., Chicago, Ill.

The Novelty Pocket-Knife.

Your Name and Address on one side—Three Bees on the other side.

(THIS CUT IS THE FULL SIZE OF THE KNIFE.)

Your Name on the Knife.—When ordering, be sure to say just what name and address you wish put on the Knife.

The Novelty Knife is indeed a novelty. The novelty lies in the handle. It is made beautifully of indestructible celluloid, which is as transparent as glass. Underneath the celluloid, on one side of the handle is placed the name and residence of the subscriber, and on the other side pictures of a Queen, Drone, and Worker, as shown here.

The Material entering into this celebrated knife is of the very best quality; the blades are hand-forged out of the very finest English razor-steel, and we warrant every blade. The bolsters are made of German silver, and will never rust or corrode. The rivets are hardened German silver wire; the linings are plate brass; the back springs of Sheffield spring-steel, and the finish of the handle as described above. It will last a long time, with proper usage.

Why Own the Novelty Knife? In case a good knife is lost, the chances are the owner will never recover it; but if the "Novelty" is lost, having name and address of owner, the finder will return it; otherwise to try to destroy the name and address, would destroy the knife. If traveling, and you meet with a serious accident, and are so fortunate as to have one of the "Novelties," your POCKET-KNIFE will serve as an identifier; and in case of death, your relatives will at once be notified of the accident.

How appropriate this knife is for a present! What more lasting memento could a mother give to a son, a wife to a husband, a sister to a brother, or a lady to a gentleman, the knife having the name of the recipient on one side?

The accompanying cut gives a faint idea, but cannot fully convey an exact representation of this beautiful knife, as the "Novelty" must be seen to be appreciated.

How to Get this Valuable Knife.—We send it postpaid for \$1.25, or give it as a Premium to the one sending us 1000 NEW SUBSCRIBERS to the Bee Journal (with \$3.00). We will club the Novelty Knife and the Bee Journal for one year, both for \$1.00.

GEORGE W. YORK & CO.

St., Chicago, Ill.

Please allow about two weeks for your knife order to be filled.

ESTABLISHED IN 1861 AMERICAN THE OLDEST BEE-PAPER IN AMERICA BEE JOURNAL

41st YEAR.

CHICAGO, ILL., DECEMBER 12, 1901.

No. 50.

* Editorial. *

The Chicago Convention held its best meeting last week. It was also the most largely attended, the room being crowded at every session—about 100 present. There were bee-keepers from three or four different States. The discussions were taken in shorthand, so we will be able to place before our readers a complete report later on. It will easily be worth a year's subscription to the American Bee Journal. There was only one paper read, all else being interesting questions, which were discussed in a manner equal to the Buffalo convention, which report is now appearing in these columns.

Can We Have Better Gatherers?—Mr. Getaz, in this journal, having expressed the opinion that, although we might increase the size of bees and length of tongue, yet there was little prospect of increasing honey-gathering qualities, F. B. Simpson says in the Bee-Keepers' Review:

"The bee is not a domestic animal, or even domesticated; and we have done little to change her condition of life except to give her a better home; but by most careful selection I think we will be able to continue to increase gradually the average honey-yield until we obtain great uniformity, and, possibly, an average very near our present maximum yield."

Bee-keepers will probably wish that Mr. Simpson may prove the better prophet.

The Directors' Meetings at the Buffalo convention were held during the sessions of the convention, and a Straw in Gleanings in Bee-Culture reads thus upon the subject:

I want to say in language somewhat emphatic, that some better way should be provided than to have Directors' meetings that keep directors out of the sessions of the annual convention of the National. It isn't fair to the directors; and if they are good for anything, it isn't fair to the convention.

Editor Root then follows with this comment:

You are right; but the time of our National conventions is so much taken up by general convention work that it is often difficult to squeeze in a little side-committee work between the sessions. I think the time will have to come when the directors will have to consult by letter, and that the discussion of these questions will have to be done through correspondence. Such a plan is unsatisfactory, in that it gives the chairman of the Board almost exclusive power to direct. If he chooses, the work of the entire Board, I speak from an experience based on the time I was chairman of the Board; and at that

time I saw how easy it was to get indorsed any plan I had. If he suggests, for instance, that such and such a thing ought to be done, and gives his reasons therefor, in the absence of any counter-argument, his proposed policy is sure to carry, when it may not always be wise.

There is good ground for the objection raised, especially when, at Buffalo, the president happens to be one of the directors. If the interests of the Association seem to demand a meeting of the directors' in person, it might not be a bad plan for them to convene a day or so in advance of the convention, so that all their business might be concluded before the opening session of the convention. This would be asking, perhaps, rather more than is reasonable from men whose time may be of considerable value, and who in any case give their services gratuitously as directors, and it would not be a very great wonder if in some cases, since directors are only human, a director or general manager might be led to say:

"I don't want to appear mean, but attending the convention is rather expensive business at best, and since this extra burden is put on, I can hardly afford to attend this year."

Certainly it would be nothing more than fair that an allowance should be made from the treasury to reimburse at least the expenses of the extra time.

A New White Clover is praised in the foreign bee-journals. It originated in Germany, is called *robusta Indiana*, and is said to yield a much larger amount of fodder than the common white clover. Nothing is said of its value as a honey-plant.

The Poison of the Sting is still spoken of as being formic acid, and it is even said sometimes that formic acid from the sting is dropped into the honey in the cell; but Dr. Langer's investigations have shown that the poison is a different matter altogether, having a mere trace of formic acid in it.

Carbolineum for Hive-Paint.—This new acquaintance comes from Germany, where it is highly spoken of. An editorial in Gleanings in Bee-Culture gives considerable information regarding it. Instead of forming a coating on the surface like other paints, carbolineum strikes clear through the wood, so that when one side of a 7/8-inch board is painted with it a splinter from the opposite side will taste of the material 21 hours later. It costs only half as much as good lead paint, and it is said that railroad ties saturated with it last three times as long as when not so treated.

Mr. O. O. Poppleton thinks it objectionable

for hives because of the strong odor of cresosote, and because of its almost black color, yet he has used it for some years to preserve his hive-bottoms. The dark color would make little difference where hives are kept in the shade, although objectionable where they stand in the hot sun. Even if it be not desirable to use it for anything but hive-bottoms, it may be quite an acquisition for that purpose, for it is the bottom of a hive that rots first, and in some places the bottom is ruined by ants, which would be kept at bay by the carbolineum.

Those "National" Conventions.—A Straw in Gleanings in Bee-Culture reads as follows:

"It might not be a bad idea for each annual convention to nominate three candidates for general manager, and nine candidates to succeed the three directors whose terms expire with the following December." That's a suggestion of Editor York as to the National. It's worth considering for the future.

The following paragraph contains Editor Root's opinion on this subject:

I do not believe it would be wise to bring about conditions or a precedent whereby the office of general manager, at least, should be changed as often as once in two or three years. When we get a good man, as in the case of our present general manager, we ought to hang on to him. One who has been in the harness, and knows how to pull, should not be made to give place to one who may be merely popular in the eyes of bee-keepers or members of the Association, and yet possibly be entirely unfitted for the exacting and important duties of the office. But I do believe Bro. York's suggestion is all right for the Board of Directors. Some of us who have been so long on that Board could just as well get out, and thus place the responsibility for the success of the organization on other men whose help we need.

In the suggestion made in this journal there was no contemplation of bringing about any condition or precedent looking toward any change in the office of general manager. As the matter now stands, the manager is elected or re-elected every year. His being nominated in advance at the annual meeting would not be likely to make any change. So long as the man already in office was regarded as the best man for the place, he would be sure of nomination at the annual meeting as he would be sure of election if there had been no previous nomination. In general, there would be no need of any nomination. But there is need of nominations for directors, and as the election of manager occurs at the same time as the election of directors, the nominations should be made at the same time. There will, however, come times when it may be necessary to elect a new manager, either because the old one dies or will not longer serve, or because it is thought some other

man might fill the office more satisfactorily. In such case will easily be seen the advantage of a previous nomination; and if there should be anything like unanimity in the nomination at the annual meeting, it would be a great help toward deciding who was the right man to vote for.

In this connection it may be said that Editor Root has requested that his name and that of his father should be dropped at the expiration of their respective terms of office. Certainly, it does not seem necessary to have two directors from the same town, although all would not agree that the younger Root should be dropped just yet.

Wm. Rohrig, of Arizona, and Editor H. E. Hill are named in *Gleanings in Bee-Culture* as proper persons to be elected as directors. Mr. Hill, however, asks that his name should not be used, giving reasons therefore.

Breeding from the Best has been the motto with perhaps the most of breeders, but, as already mentioned, F. B. Simpson would prefer, for improvement, to take a queen of stock that showed not such a very great yield above the average, but rather of stock that showed a *uniform* increase, even if this increase should not be very great. To this Mr. Adrian Getaz replies in the same paper (the *Bee-Keepers' Review*) as follows:

Mr. Simpson thinks that since an exceptionally good queen is necessarily more or less of a freak, and therefore liable to give an irregular progeny, it would be well not to use her for breeding.

It depends upon what the queens are reared for. If it is for sale, it might be best not to take any chances, as a very few worthless queens are enough to ruin a breeder's reputation. But if the object is to improve the stock, I should say use her by any means, and select the best of her progeny until the strain is fixed.

It is a matter of fact that all of our best varieties of vegetables and flowers are freaks that were selected, or sometimes accidentally found, and perpetuated by close breeding. Many of our fancy breeds of dogs, chickens and pigeons originated also in that way. The silk-wool merinos are descendants of a ram that was a freak; and now the race is well established.

The Ontario Convention was held last week at Woodstock. We are informed that it was a good and profitable meeting. We expect to publish a full report of the proceedings. Our Canadian readers will be specially interested in this, though it will be of great interest to all, as Ontario has some of the best bee-keepers in the world. They attend conventions, too, and thus "let their light shine" for others.

The New York State Meetings of bee-keepers, to be held this month, should be well attended. Pres. Marks announces them on page 799. We trust that our readers will do all they can to make them a success, and thus prevent their discontinuance.

Sweet Clover in the Rockies, according to W. P. Collins in the *Rocky Mountain Bee Journal*, is to play a very important part in the future, covering all the slopes that are now barren, and affording floods of honey.

The Buffalo Convention.

Report of the Proceedings of the Thirty-Second Annual Convention of the National Bee-Keepers' Association, held at Buffalo, New York, Sept. 10, 11 and 12, 1901.

(Continued from page 775.)

LENGTH OF TONGUES OF BEES.

Mr. Rankin—I had hardly expected to talk to you this afternoon, and what I have to say will be entirely extemporaneous. It has been my pleasure to be connected with the Michigan Experimental Station for about five years and during that time I have been doing something in the investigation of the length of the bees' tongues. The idea came to me at one time when I had a single colony that gathered a half more honey than any other in the yard. I began making investigations with crude machines to measure the tongues. I have been working right along on that line. I have run across a difficulty in the mating of queens—getting the queens mated to the desirable drones is the difficulty. Personally, I don't know how it will be unravelled, but I am confident it will be done some time or other. I have observed right straight along that a colony which gathered an exceptional amount of honey was one that had correspondingly long tongues, and the tongue for one bee in the colony is the rating for the tongues of every bee in that colony; that is, the tongues are uniform. You don't get one bee in a colony with a tongue 7 millimeters or 22-100 of an inch long, and the rest of them run away down low. Now, a young bee hasn't as long a tongue as a full-grown bee, but if you gather the bees which you are measuring as nearly the same age as possible, you will have a uniform length of tongue, and I think this is one of the problems which bee-keeping will solve in the future, that is, breeding bees with a longer tongue. It is true we can produce a strain of bees just as superior to that we have now as the strain of live stock we have now is superior to that of our ancestors began with. Do not let us carry this thing too far and make a hobby of it and run it into the ground, but let us keep our eyes open, and if we have one colony of bees in the yard that is giving us exceptional returns, let us rear some queens from that colony and put those queens in from the stock that is doing the best work. I have found out by talking with bee-keepers all over Michigan, that bee-keepers rear their queens from wherever it happens when the colony swarms, and no matter if that be a poor or good colony, that queen is allowed to go right on and lay eggs and be the mother of that colony. If you have an exceptional strain, produce that strain in your other colonies; bring them all up to that standard, and that is the practical side of bee-keeping to-day. In relation to in-breeding, I don't think we need be very much afraid of this at present. I don't know

of a single scheme which has been brought up that a queen will be mated to drones from the same stock. If in-breeding were carried on to an extent that would degenerate live stock, it would probably degenerate the bee. I don't think that from any of our systems—anything that we can get is not systematic enough to bring this crossing to such a small focus that it will be possible for us to inbreed enough to hurt. I do think the bee-keeper of today can improve his stock by selecting his queens and his drones. If you have four or five successful colonies, by all means breed from them.

FOUL BROOD IN MICHIGAN.

Mr. Rankin—As far as foul brood in Michigan is concerned, we had some of it up there. I think my record for any one day this summer was to condemn 118 colonies, and that in two yards. Those people are all going to treat theirs. I have so far visited perhaps over 4,000 colonies. I have been on the road since July 1, and came directly from the field here, and am going back to the field to-night.

Dr. Mason—Are you in accord with Mr. McEvoy when he says that a hive that has foul brood in it, does not need disinfecting?

Mr. Rankin—The stand I take is that if the hive is perfectly free from any drops of honey, it is probable that the disease will not be produced by putting a clean swarm of bees into it; but on the other hand, if there is any honey around the hive the disease will in all probability be reproduced. But that is not the point. We have a lot of ignorant people in our State, and when you talk to a farmer about a bacterial disease and tell him what the characteristics of a germ are; when you tell him that you can put 25,000 of them on the head of a pin, they will just stand and look at you. If you take the ordinary bee-keeper and tell him that there is no use of him disinfecting his hive, it has been my experience that he will go right out and do something which there is no use in, and which renders his treatment a total failure. The principal reason why I place the stress on disinfecting hives, and in washing your hands in an antiseptic after examining a diseased colony, is, to impress upon those bee-keepers more forcibly the virulence of the germs, and the precautions they must take. I use bi-chloride of mercury. It doesn't smell so bad as carbolic acid.

Dr. Mason—What do you think of salicylic acid and borax?

Mr. Rankin—I don't like it. The salicylic acid is all right if you have it in a strong enough solution. I think it well to convince a man that one

thing is right and have him stick to that.

Mr. Sleeper—How long is a bee's tongue, ordinarily?

Mr. Rankin—They range all the way from 14-100 to 21-100 of an inch.

Mr. Sleeper—How long would a tongue have to be to be a long-tongued bee?

Mr. Rankin—Anything over 18-100 is above the average. 18-100 is about what you will find in the best-bred bees around through the States.

Mr. Sleeper—Can bees with tongues 18-100 of an inch long gather honey from red clover?

Mr. Rankin—They can when the corolla-tube fills with honey up to that point. The red corolla-tube is about 35-100 to 50-100 of an inch long.

Mr. Abbott—The actual fact is that this year the corolla-tube of red clover is not more than half as long as it usually is, owing to the dry weather, and the bees are all working on it now.

Mr. Betsinger—How near must the bee come to the honey-tube in order to draw all the honey out of the tube?

Mr. Rankin—I don't think a bee can draw honey any further than it can reach.

Mr. Betsinger—Then if the corolla-tube is so full of honey that the bee can insert its tongue half way down into the honey, it can only draw as far as its tongue is inserted, and it will stop drawing from that point. I think you will find from observation that if the bee can touch the honey at all, it draws out every mite of honey that is in the corolla-tube.

Mr. Rankin—I have done that same thing, and when you take one corolla-tube out of a flower and hold it up in your fingers and let a bee draw honey from it, it will empty the tube, but will it do that when it is in a head and pressed right in that? Has the bee power enough to collapse that honey-tube, which it must do? The capillary attraction holds the nectar right in that tube.

Mr. Betsinger—Isn't it a fact that the bee takes a tube alone and handles it separate from the rest?

Mr. Rankin—But that tube is in the head and fastened right in there. After they drop down when they are ripe, the bee has no more to do with them. They will draw the nectar out clear from the bottom, but I don't think they will do it when the corolla-tube is in the head.

Pres. Root—I have examined a good many clover-heads when the bees had gone all over them. I have then drawn out the corolla-tubes and found considerable honey at the bottom of them. I concluded from that the bees needed longer heads.

Mr. Sleeper—In relation to foul-brood germs, I understood Mr. Rankin to say that 25,000 could not be seen with the naked eye. You have looked through a microscope at these germs many times?

Mr. Rankin—Yes, sir.

Mr. Sleeper—Have you found them anywhere else except in honey?

Mr. Rankin—Yes, sir: I have found them in the tissues of the larvae that were diseased, and, of course, you know that when you take any material whatever, no matter what it is, and put it under a high enough power microscope so that you will detect the germs, you

will get anywhere from ten to 500,000 species of germs.

Mr. Sleeper—They exist independent of honey?

Mr. Rankin—They exist in the bodies of the larvae which are diseased.

Mr. Sleeper—Don't they exist anywhere else except in the larva and the honey?

Mr. Rankin—I don't think there is anything in the hive aside from the honey and the tissues of the larvae from which the germ will get sustenance. This germ will not grow in acids or anything else.

Mr. Benton—Why confine it to the larva alone? Why not say in the pupa and the adult bee?

Mr. Rankin—Do you know that is so? I know that this is so in the larva. I don't think that you will find any germs of foul brood in the adult bee outside of the honey-sac. I have looked for it and failed to find it.

W. L. Coggs—How many different forms of germs do you find—is there more than one in foul brood?

Mr. Rankin—No: foul brood is caused by one germ—bacillus alvei—which is a specific germ, twice as wide as it is long. I never have examined the germ of black brood under a microscope.

RESOLUTIONS ADOPTED.

Mr. Abbott then introduced the following resolutions:

Resolved, That the thanks of this Association be extended to the Mayor: to the Buffalo Society of Natural Sciences for the use of this hall and committee rooms; and to Dr. Smith, President of this society, for his cordial address of welcome; and to the janitor for his careful attention to our wants; to the local bee-keepers of Buffalo for the beautiful badges they have furnished us, and for the use of a piano."

Resolved, That we extend to the Texas Bee Keepers' Association our thanks for the interest they have shown in the prosperity of the National Association by sending two delegates to attend this meeting.

The resolutions were adopted.

BOILING FOUL-BROODY HONEY.

"I have read of boiling honey from foul-broody combs and feeding back. How much water should be added, and how long should it be boiled?"

Mr. McEvoy—I don't like to answer that question, from the fact that I never advised the feeding—the public is too careless. They will give the disease through it. They merely heat it, and they might just as well give it raw; but where I have added nearly a third water, and sometimes nearly half, and brought it to a sharp, bubbling boil, I never noticed any bad effects from it.

Mr. Rankin—If you could be certain that the honey would be boiled it might be all right. Prof. Harrison, of Guelph, Ont., has within the past year published a bulletin on foul brood. He has demonstrated to us that you can boil the spores of foul brood for something like two hours and still produce a growth. The question is here. Do we have any spores in the honey? I have never seen any foul-broody honey fed back that did not produce the disease, but I have not had the experience that Mr. McEvoy has had. I have been in this business only a short time, and I haven't tested it thoroughly,

but I do not think it is safe to recommend the feeding back of foul-broody honey in any instance whatever.

Mr. McEvoy—I told a farmer, who would insist on feeding back foul-broody honey instead of buying sugar—I told him how to do it. I went back to examine that apiary and every one of the colonies had foul brood. I said, "Did you boil the honey?" He replied "Yes, it was boiled." "Who boiled it?" "The girls." I said to the girl, "Did you boil it?" She said, "Yes, it was that hot that I could hardly put my finger in it."

Mr. Sleeper—This gentleman speaks of spores. Now I understand that they are seeds, are they not? I would like to know whether these are animal, or vegetable.

Mr. Rankin—They are the same as other germs. Some authorities say they are vegetable and some animal.

Mr. Benton—I think that they are vegetable and not animal.

Dr. Mason—Is there anything in the foul-brood line in honey that will not be killed by being boiled?

Mr. Rankin—We have the statement of Prof. Harrison that the spores may be boiled, I think 2½ hours, before they are killed.

Mr. McEvoy—I was going to say if they would add about half water and bring it to a sharp, bubbling boil it would kill them.

Dr. Mason—Science is a fine thing, but good, practical experience is a good thing. I had at one time about 80 colonies with foul brood, and the honey when extracted was so thick that when you would start to pour it out it would go in a chunk; and I boiled that honey and fed it back to the bees and didn't spread any foul brood. I don't think there is any living thing in honey that boiling won't kill.

Mr. Sleeper—How long do you boil it?

Dr. Mason—I make sure it is all boiled. I boiled it in a wash-boiler and I dipped up boiling honey and poured it on the sides so as to rinse down the unboiled honey, and made sure that it was all boiled; but you want to know it is all boiled, every particle of it.

Mr. Benton—All of these bacilli have their certain temperatures to which they have to be heated to be killed. Now the whole thing is this, that the absolute temperature for killing these is not known. All it needs is to determine the lowest temperature and use a thermometer and be sure that the whole mass reaches that temperature. Water boils at 212 degrees, and this mass being much thicker was probably raised to 230 degrees before it boiled, and that is about the temperature that would kill it. Mr. Cheshire asserted that the bacilli did not exist in great numbers in the honey, except as an accidental impurity, and that they would not thrive or live there.

R. B. Rians—My experience agrees with that of Dr. Mason. I have taken foul-broody honey and reduced it very little with water and boiled it until it would almost boil over, and fed it back to my bees without any bad results.

Mr. McEvoy—You take an old, dry comb that has had foul brood in it, that has stood for ten years, and it will give foul brood.

BREEDING FOR DESIRABLE TRAITS.

"In breeding for desirable traits,

which is the more important, the drone or the queen?"

Mr. Hutchinson—I think one would be as call-breath as the other.

Mr. Callbreath—My idea is that there is a difference in the vitality of drones and queens, the same as there is in human beings, the one that has the greater vitality will affect the progeny the most.

Mr. Benton—I should consider the queen more important.

"What is the best way to prepare barrels for extracted honey?"

Dr. Mason—Drive the hoops tight.

BEES-CULTURE IN TEXAS.

Mr. Davidson—Our Secretary was to furnish us with a report of the number of colonies and bee-keepers in Texas, but he hadn't furnished it before I left home. Our State convention instructed our secretary to furnish us with a report of that convention, but I didn't get it in time.

Dr. Mason—Make it out and send it to me. (I have not received it yet—Secretary.)

Mr. Davidson—I think there are something over 2000 colonies of bees in the State of Texas. I don't remember the number of bee-keepers that own them. We have a good country for bees. We have no disease among our bees—never have had. I think there has been a bad impression made in the North in regard to Texas honey. The northern portion of the State produces honey gathered from wild flowers and woods, and sometimes the honey sours and is not of good flavor. Our honey is very white. I saw a good deal of honey in the exhibit here similar to it. I would like to thank the bee-keepers of the Northern States for their kindness to the Texas representatives, and also to the Canadian bee-keepers. We wish to extend an invitation to the National Bee-Keepers' convention, to have their meeting in San Antonio, Tex., next year, or any year after that.

Mr. West—In regard to Texas, you say you have no foul brood or bee-diseases there. Do you have any enemies to your bees that cause destruction? You haven't the winter that we have in the North. Do you have anything that you have to fight?

Mr. Davidson—No, sir. We have no enemies to the bees there that I have ever found. I have been keeping bees there for 15 years, and I have never seen any foul brood there. No winter loss at all. Our bees work nearly the whole winter. The moth does not bother bees in the South where the man understands his business and keeps his bees in the right condition.

Mr. Longnecker—Do you ever feed in the spring to stimulate brood-rearing?

Mr. Davidson—No, sir; we have an early, light honey-flow that commences about the middle of February. I never fed a pound of anything to our bees yet at any time of the year. The source of our main honey-flow is the mesquite and a shrub. We have the surest country for honey, I think, anywhere in the world. If it rains we get some honey, and if it is dry we get a great deal more. The dryer it gets the more honey we get.

Mr. Baldrige—Do you have any loss from heat melting the combs?

Mr. Davidson—No, sir; I have never suffered any loss from that cause. I keep my bees under shade. I hear

some complain, but generally it is where they leave the hives exposed to the sun. I have seen plenty of it where it was not properly attended to.

Mr. Toepperwein—You can hardly expect to hear much from bee-keepers away down in Texas, like Mr. Davidson and myself. We have come here especially to see what you people are doing here, and see what kinds of honey you produce and what you do with it. We intended to bring some good-sized samples to let you see what we are doing there, and we produce some very nice extracted honey, which we want to dispose of. There is a very poor market for honey in Texas, and if I can get any information as to how to dispose of our honey I would like to learn of it here. I have brought a few samples of honey just to show what we have. Mesquite honey is a great thing in Texas. Whenever we have a drouth we get our honey just the same; and in spring, if it rains, there is the cat-claw that produces honey. There is a white bush which blossoms after every rain. If it is dry there will be the mesquite which is safe every year, so it doesn't make any difference in our portion of Texas whether it rains or not, we get our honey, and if any people from the North would like to have any information about bee-keeping in Texas I would be glad to give it to them. I have seen the honey candy within two or three days after being extracted. We have a method now of putting the honey in hot and sealing it in nice glass jars with a tin cap, and we think that will keep it from granulating.

Mr. McEvoy—What is your average yield per colony?

Mr. Toepperwein—A bee-keeper who understands his business can get all the way from 60 to 200 pounds per colony. That is, if we have a right dry season. I don't think it is necessary to have any less than 60 pounds.

Pres. Root—Do you have any seasons of complete failure?

Mr. Toepperwein—It has not proven to be, but it could be if it would rain just at the time of the mesquite blossom.

Pres. Root—Do you allow your bees to swarm where you run for extracted honey?

Mr. Toepperwein—Yes, sir; I let my bees swarm, and get a crop from the old colony and from the swarm, too.

Mr. Longnecker—I think you will find one of the points against buying Texas honey in the North, it is candied too much. Northern consumers won't buy candied honey.

Mr. Toepperwein—What we are trying to do up here is to make connection with some concern, and have stations where bee-keepers can take their honey and ship it in carloads, and the agent comes around and buys the honey at a reasonable price and ships it up here in car-loads.

W. H. Heim—I would like to ask Mr. Toepperwein whether they produce very much comb honey there, and what the average is per colony.

Mr. Toepperwein—The bee-keepers down there are getting to produce this chunk honey now. It is cut out of the frames and packed in cans with eight-inch screw caps. The people down there are getting to do that because they say there is no market for extracted honey. I wouldn't produce any but extracted myself. Another thing,

if they produce comb honey, they ought to produce it in sections.

Dr. Mason—If you can dispose of chunk honey, why don't you produce it?

Mr. Toepperwein—Now, chunk honey, you have to put in foundation. There is great expense. The bees will have to build that every time.

(Continued next week.)

Other Conventions

The Colorado State Bee-Keepers' Convention.

BY D. W. WORKING, SEC.

It was a big thing—this 22nd annual meeting of ours—and all the wide-awake bee-keepers in the country ought to hear about it. Will the American Bee Journal let me tell them?

The introduction must be brief; so that the really important matters can be given appropriate mention.

We met, as was advertised, in Representative Hall of Colorado's beautiful Capitol building, and had every convenience that the most particular bee-keeper could desire. The program was carried out with very few changes. Editor Root was not able to be with us; but Editor Hutchinson occupied the first evening with an instructive and entertaining talk illustrated with magic-lantern views. The papers and discussions were of great value, and will be furnished to the readers of the American Bee Journal, the discussions in condensed form.

The address of Pres. Aikin attracted marked attention, and the paper on long-tongued bees by Professor Gillette of our State Agricultural College, was an exceptionally instructive study of this seductive subject. I suspect it will elicit a good many "explanations".

The exhibit of bees and bee-products was an experiment, but so successful that it will be repeated under the management of a competent committee. An interesting outcome was the award of the first premium for the "best ten sections of white honey" to an exhibit of last year's product; and this in spite of the fact that the winner had new honey entered for the same premium, and the additional fact that there were several other contestants for the prize. The judges—one of whom was Editor Hutchinson—did not suspect that the premium honey was old. Moreover, they did not seem the least bit annoyed when told what had happened.

The election resulted in the choice of a new President, J. U. Harris, of Grand Junction; and a new Vice-President, M. A. Gill. The Secretary and Treasurer were reelected. Mr. Harris was advanced from the vice-presidency, and Mr. Gill comes up from the ranks.

The Association at the present time has the largest membership in its history, and there are good reasons for believing that it will not decrease in numbers and usefulness during the coming year. Mr. Aikin, the retiring president, after eight or nine years of faithful service, received the unanimous thanks of the Association for his successful labors. As

a private (though not a common) member, he will continue to have a large influence among the bee-keepers of the State.

It should be mentioned that, during the last afternoon, the Governor was hustled away from an important meeting of the State Land Board, and brought up stairs to see the largest assembly of bee-keepers he had ever faced. He made a pleasant off-hand speech, promising to be of use whenever it should be possible. He will have a chance next year.

The Association did not forget to be thankful (and to express its thanks) to all who had helped to make the three-day meeting successful and in every way interesting and profitable.

This brief report makes no pretense of being complete. Later on—if the editor will permit—items of information about the meeting may be sandwiched in between formal papers and discussions.

It is not to be forgotten that the meeting was a big thing.

Arapahoe Co., Colo.

Report of the Utah Bee-Keepers' Convention.

The last convention of the Utah Bee-Keepers' Association was held in Salt Lake City, Oct. 5. The meeting was called to order by Pres. Lovecy. There was a good attendance, and an interesting session was held.

County vice-president, Geo. Howe, of Utah County, by request spoke on the different sizes and kinds of hives. He said that he used the Langstroth and American hives, and that the bees must be kept dry, as it was the dampness that killed them in the winter.

Wm. Blake said that he was interested in both bees and fruit, and he thought those two industries should go together; that a more paternal feeling should be cultivated, as they were each benefited by the other.

J. A. Smith, of Wasatch County, writes: "We have sold our crop of 358 cases of comb honey for \$2.65 per case. The honey season was never better than the past summer. We had a late spring, and the bees were weak, and in some instances the mortality ran as high as 75 percent."

Vice-President Rees, of Weber County, sent regrets at not being able to be present. He also said that the first part of the season was bad, some of the bees being in an almost starving condition, except where they were fed until the second crop of alfalfa came into bloom. After that time they did very well. He said he had taken 70,000 pounds of extracted honey from 1,000 colonies; the honey-flow, although not heavy, held on late, which will help the bees to get in good shape for winter, causing them to rear lots of late brood, which will furnish bright young bees—the very thing for good wintering.

The President's Address.

The bee-industry in our State in this the beginning of the new century, although we have received some fairly good reports, on the whole they cannot be considered as good as might be desired; while in some of the southern counties the honey-flow has been un-

usually good, as also in some localities in the northern part of the State. The great honey-producing belt in the central part of the State, which last year and some other seasons produced, in some instances, an average of about 300 pounds per colony, this season, over nearly the entire district, yielded from about half a crop to a total failure. While there may be other reasons for this falling off, the principal ones are drought, a lack of irrigation-water, and grasshoppers; and in addition to this, in Salt Lake County, at least, is the smelter smoke; while in a few instances, in the best honey localities, the bee-keeper gets enough from his bees to make it profitable, the bees always die off through the fall from the effects of smoke settling on the bloom. We have been informed that one or more of the companies are going to put in smoke-consumers this winter. We hope all will soon follow their example, as this question is getting to be a serious one to dairymen and farmers as well as bee-keepers.

But aside from the smoke, the grasshopper plague has been the principal cause of the destruction of the honey-flow and other crops in several counties. We wish to call the attention of our bee-keepers, farmers and fruit-growers to this matter. It goes without saying that it should be plain to every thinking mind that some energetic effort is necessary to suppress this pest. In some portions of Salt Lake and other counties, the past season, the grasshoppers destroyed nearly everything that grew—potato, alfalfa and other fields were eaten off bare to the ground. In the latter part of July I visited several orchards, and there was not a sign of a leaf left in them. Some of those trees will die, as the new growth of wood, together with the bark and buds of the small branches, are eaten off; and the alfalfa will die where it is eaten down into the crown of the plant.

Now for remedies that can be made effective if carried out intelligently: Our sacred friends, the gulls, came and destroyed billions of them the latter part of July, but as they do not come until the breeding season, it is too late to save the crops. Then the next best remedy which can be used when desired, are turkeys or chickens. While either can be made effective, the turkeys are best if properly herded. Make a sufficient number of strong, portable coops that can be drawn where desired, and that can be closed so as to protect the birds at night. If the scheme is properly carried out, it will not only settle the grasshopper pest, but it will prove a profitable business in raising the birds for the market.

There have been some experiments of late along the line of trying to protect our bee-keepers and fruit-growers by destroying the moth and other destructive insects, the object being to destroy the moth and eggs at the same time, without the use of a poisonous spray, which has not been, and will never be, a success in reducing the number of those destructive insects.

While it will be seen, from some of the reports sent in, this dearth of honey has been by no means universal over the state, if we can succeed along the lines indicated, we believe the old-time prosperity will again be recorded

generally. It is desirable, also, in that it would be beneficial to all concerned to have Colorado and Utah bee-keepers in closer touch with the disposal of their products.

E. S. LOWES.

Another method of catching grasshoppers is, in cutting lucerne, to leave a swath every two rods, on which the "hoppers" will congregate. Make a sack, out of ordinary sheeting, about six or seven feet long and three to four feet wide, and attach the mouth of it to a wooden frame of the same size to keep it open. Then two persons on horse-back drag the sack up and down the swath where the grasshoppers are—they jump into the sack and are caught. This sack can be used wherever it can be dragged around. It should be used only at night or early morning, as the hoppers then are not so easily frightened—they seem more stupid.

E. Johnson thought it would be a good idea to co-operate in buying supplies and in marketing bee-products. He also offered a resolution which carried, that the officers of the association make an effort to form a closer fraternal union with Colorado bee-keepers.

Mr. Cornwall said he had lost his bees for several years on account of the smelter smoke. He purchased more, but they always died in the fall. He said but for the smoke his bees would otherwise be healthy.

J. Ferry said that nearly all the bees in that locality were dead; the smelters were about five miles distant, but he had no doubt that the smoke from them killed the bees.

Mr. Falkman, of Weber County, said that, taken as a whole, the bee-industry had not proven a success the past season.

J. H. Bartlett, of Uintah County, said the bees in that locality had produced from a third to half a crop. They had no foul brood or other disease.

Mr. Chritchlow said he had moved his bees to Idaho. He had taken 400 cases of honey from 150 colonies.

Mr. Wilding thought the Kidder hive a good one to winter bees in. He thought the best way to get rid of foul brood was to destroy hives and everything affected by the disease.

FOUL BROOD CURE—NEW METHOD.

Take the infected colony in the morning, after the bees have begun flying freely. Catch and cage the queen and place her on top of the brood-frame, where one can get her readily without disturbing the colony. Then in the afternoon, about 3 o'clock, get a clean hive filled with foundation. Leave space in the center for one frame; now take a frame of clean, healthy brood, shake most of the bees off, and take the queen from under the cover where she was caged in the morning. Liberate her on the frame of brood, place it in the space reserved for it in the clean hive. Now, quickly and quietly remove the infected hive to one side, and place the clean hive on the old stand. The field-workers will now enter the new hive and go right on working as usual. Now strip up the center of the old hive and put it on top of the clean one, with the back of the infected hive to the front. Now bore a hole in the back of the foul hive. Make a runway out of a piece of shingle; nail a strip on each side and on top, making a bee-space; nail this on front of the hive, and be sure to cover the hole. This will make a bee-space so they can come down from the upper story and go out. Leave the hive on top for about three weeks; by this time all brood will be hatched out, and will be below. The live

can now be taken away and destroyed. This must be done only through a heavy flow.

INSPECTOR EVANS.

Another cure for foul brood is as follows: Take equal parts of carbolic and salicylic acids, saturate a flannel cloth and put it between two thin boards, so that the bees can not touch the flannel or acid. Put this in the place of center frame of the hive, removing the frame.

Mr. Gardner gave an interesting sketch of a bee-house 9x28 feet and 7 feet high, holding over 100 colonies. He manipulates his bees in the house, keeping them in it winter and summer. He has three tiers of hives on each side of the house, running north and south. The house is built with tight board

rustic. The hives are pushed up against the boards of the house, with the entrances opposite corresponding holes cut in the boards. The walls are painted several colors, in perpendicular stripes, after the style of a barber pole, each stripe being the width of a hive. In this way the bees have no trouble locating their hives. He says the house has proven a success with him, the bees being easy to handle, with much less work, and his loss in winter, so far, has not exceeded five per cent.

The honey crop in Uintah County was short, on account of a small, white, flying insect, the insect being very numerous in all nectar-producing bloom. The pest made its first appearance July 1, and remained until the bloom was killed by frost.

Mr. Neilson gave a very interesting description of a moth-trap he has invented for the destruction of the codling moth and other insect pests. He stated that by this method the moth and its eggs can be caught and destroyed at the same time, which makes it much more effective than spraying. He said the old-time poison spray had never been a success, and never could be, because of the small percentage of larva caught—often not more than two per cent.—and the harm done often exceeded the benefits derived. He was sustained in this view by several practical fruit growers present, some of whom said they had given up poison spraying as an expensive luxury, and not worth following.

Contributed Articles.

Long-Tongued Honey-Bees.

Read at the recent Colorado Bee-Keepers' Convention at Denver.

BY PROF. C. P. GILLETTE,
of the Colorado Agricultural College, at Fort Collins.

Who first suggested breeding for long-tongued honey-bees, I do not know. It is said that a Mr. Wankler, of Germany, invented an instrument as early as 1882, for the purpose of measuring the length of bees' tongues. So far as I have been able to learn, the first person to bring this matter prominently before the bee-keepers of this country was Mr. J. M. Rankin, of the Michigan Experiment Station, at present foul-brood inspector for that State. Mr. Rankin attempted to breed up a long-tongued strain of bees and believed that his efforts were crowned with some measure of success.

During the past year, or eighteen months, the subject of "long-tongued" or "red-clover" bees has been greatly agitated in the bee-journals of the country and has come to be a veritable fad. A person having queens to sell feels that he is greatly behind the times—a sort of back number in this age of progress—unless he can guarantee his queens to produce a long-tongued variety of worker-bees. The result is, he so advertises them without knowing the real facts in the case, but with the belief that his bees have tongues as long as any.

To a student of biology, particularly if he be an entomologist, the idea of a long-tongued race of honey-bees coming quickly into existence, seems extremely improbable. There is no more important organ in the anatomy of the honey-bee than its tongue for the maintenance of life, and nature has been breeding this tongue to a standard length for so long a time that it is not likely to vary rapidly under artificial selection where parentage can be controlled upon one side only. For these reasons the writer took no interest in the matter when it was first agitated. Finally, so many bee-keepers of known honesty and sincerity of purpose began to advocate breeding for long-tongued bees, and to advertise that they had such bees for sale, that it seemed necessary that some one, having the facilities and the necessary training, should make a careful study of the subject and report results. The writer began to collect bees for the purpose of testing tongue-length early last summer. It was not possible to spare a large amount of time for this purpose, but I felt warranted in making this preliminary report, and am expecting to publish a fuller one after continuing the work farther.

WHAT IS MEANT BY TONGUE-LENGTH?

The so-called "tongue" of the honey-bee is a very highly specialized organ made up of many parts. The longest single piece is the ligula, which is very flexible, yellowish in color, and thickly set with short hairs. Into this the nectar of the flower is first taken. It is supported by a

black, rigid, chitinous piece called the mentum, which is about one-third as long as the ligula. At the base of the mentum is a still shorter piece which is also hard and rigid—the sub-mentum—and this is attached to the underside of the head by two slender, stiff rods, jointed at the middle and known as the cardos or hinges. These medium parts with the attached portions (the two sets of palpi and the maxillae) make up the parts of the tongue. The important question which presents itself here is, What shall we base our measurements upon in giving tongue length?

In breeding for long-tongued bees what one would want to know is the distance the tongue can be made to reach beyond the jaws or mandibles—"the tongue-reach," as it has been called. This is the measure which has been given by Mr. Root and most others, so far as I know, who have reported lengths of bees' tongues.

Glossometers have also been constructed to measure this tongue-reach in the living bee. This seems to me like endeavoring to determine how far a man can reach above his head. If we could catch him putting forth his utmost efforts to reach in that direction, and could get him to hold still long enough, we could determine the distance with considerable accuracy. On the other hand, when we have to determine this point from measurements of the dead or chloroformed body we can not obtain very accurate results. We would not know how hard to pull upon the arm just to draw it into the position of the highest reach; and if we should not pull upon it, it would, from the elasticity of the parts, draw down much too far. The conditions are worse in case of the elastic and many-jointed tongue of a bee. It would be true, as a rule, that the longer the arm, the farther a person could reach above his head, and it would be much more certainly true that the longer the tongue of a bee, the farther can it reach beyond its mandibles, as the ratios between parts in a bee are far more constant than in man. For this reason, and for the further reason that it is more easy to get an accurate measurement of the parts of the tongue when it is dissected completely out and placed upon a glass slide under a compound microscope, I have considered the entire tongue-length the best measurement upon which to base conclusions as to tongue-reach.

I believe, for practical purposes, it may always be considered true that the bee with the longest tongue has the longest possible tongue-reach. As the man with the shorter arm-reach might secure more persimmons from the tree than his longer-armed but less active brother, so the bee with shorter tongue-reach may excel her less industrious sister in collecting nectar from flowers.

In my first measurements, tongue-length only was taken into account, but in the later ones the tongue-reach, so near as I could measure it, was also recorded. An examination of the figures in the following table will show a far greater variation in the latter measurements than in the former. If the tongue-reach seemed too short when first measured, I could usually increase it by two or three hundredths of an inch by a little careful stretching. I do not mean a real stretching, but a straightening of the joints of the cardos so as to extend the tongue forward as shown in the illustration. The tongue will not remain in this position unless held there.

HOW TO KILL THE BEES.

Chloroform, alcohol, formalin, cyanide of potassium, and boiling water, were all experienced with to determine the

best killing agent, and it was found the last was the only one that would always leave the tongue in a completely relaxed condition for measurement. The water is first made boiling hot and then the bees are either thrust into the water or the water dashed upon the bees.

MEASUREMENT OF THE TONGUE.

To obtain the tongue-reach the head of the wet bee is removed and the tongue pulled out between thumb and finger as far as it will reach and pressed in this condition upon a glass slide with the face of the bee uppermost. The slide is then placed under the compound microscope and upon a rule graduated to hundredths of an inch, and the length of li gula, mentum, sub-mentum and total length read separately and recorded.

WHERE THE BEES WERE OBTAINED.

The bees whose tongues I measured have come from Maine to Texas in this country, and I have also had bees from imported queens from Germany, Italy and the Isle of Cyprus. In several cases bees were sent from the best and the poorest colonies in an apiary, and I took pains to obtain bees from those who were advertising long-tongued or red-clover queens. I have not asked permission to use the names of parties who were kind enough to send me bees, and shall not do so except in one or two cases, where I feel confident there could be no objection.

RESULTS OF THE MEASUREMENT.

Black Bees: Only four lots of black bees have been received. In one lot I obtained a tongue reach of from 13 to 16 hundredths of an inch, and a total length of from 23 to 25 hundredths, and an average of 24.5 hundredths.

Another lot gave a tongue-reach of from 14 to 16 hundredths of an inch, and a total length of from 23.5 to 24 hundredths, and an average of 23.9 hundredths.

A third lot gave a tongue-reach varying between 16 and 19 hundredths of an inch, and a uniform total length of 24 hundredths.

The lot which gave an average tongue-length of 24.5 hundredths seemed to have some Italian blood.

Carniolan Bees: I have had but one lot of Carniolans. The range of tongue-reach in these was between 21 and 22 hundredths of an inch, and the total length of tongue varied between 25.5 and 26 hundredths of an inch, with an average of 25.6 hundredths.

Italian Bees: Tongues from 24 lots of Italian workers have been measured. These have come from various parts of the United States. Usually from five to ten bees were taken for this purpose from each of the lots sent. Some of these bees were rather dark, and others were usually yellow, "golden Italians." Those having most yellow upon the abdomen did not have longer tongues than others.

In the following table I have given the variations in tongue length and tongue-reach, and also the averages of these measurements in the several lots of bees received:

TABLE GIVING LENGTHS OF BEES' TONGUES.

SOME CONCLUSIONS.

An examination of the above table will show that the entire tongue-length (from tip of ligula to base of submentum) has varied in these measurements between 24.50 and 26.50 hundredths of an inch in Italians; between 25 and 27 hundredths in Cyprians; between 23.50 and 25 hundredths in Blacks; and between 25.50 and 26 hundredths in one small lot of Carniolans. If we consider the length of ligula alone we shall see that it would vary between 16 and 17.50 hundredths of an inch in the Italians; between 16 and 18 hundredths in the Cyprians; between 15 and 16 hundredths in Blacks; and between 17 and 17.50 hundredths in the Carniolans. The tongue-reach varied in the Italians between 15 and 22 hundredths; in the Cyprians between 19 and 23 hundredths; in the Blacks between 13.50 and 19 hundredths; and in the Carniolans between 21 and 22 hundredths of an inch.

By striking general averages from the columns of averages we get, from the Italian tongue, 25.47; for the Cyprian 26.12; for the Black, 24.07.

The extreme variation in tongue-length in the Italian was but .02 of an inch; it was the same in the Cyprians, and was but 1½ hundredths in the Blacks.

The average tongue-length in the Italian exceeded the average in the Blacks by .014 of an inch; and the Cyprian tongue exceeded the Italians by .0065 of an inch.

By comparing the average tongue-lengths of all that were sent as long-tongued bees with the average length of all bees received, I find a difference in favor of the former of .0004 of an inch. The best average length of any lot sent me as long-tongued was .2555 of an inch, which is but .0008 of an inch longer than the average length of all the bees sent. An examination of the table will show eight lots of Italian bees with an average tongue-length exceeding that of the best lot of "long-tongued" bees.

I shall have to conclude that, so far as my study of the subject has gone, there has been no indication of any strain of the common honey-bee (*Apis mellifera*) worthy of the distinction "long-tongued." If any of the bees examined are worthy of such a name, it is the Cyprians. It is possible, however, that the average length of tongue in this race may be changed by the examination of more material from other apiaries.

These facts do not disprove that there may be strains of bees that work more freely than others upon red clover. It does indicate very strongly that the difference in tongue-length has little or nothing to do with the tendency of bees to work upon red clover. In fact, I have received bees from colonies that were said to work freely on red clover, and along with them bees from other colonies in the same apiary that were said not to work upon red clover, and have been unable to find any difference in tongue-length in favor of the clover workers.

It will be noticed in the table that the few tongues of bumble-bees that were measured are very much longer than the tongues of any of the honey-bees, the shortest being .45 and the longest .58 of an inch. The average length is almost twice the average length of the tongue of the honey-bee.

The specimens of *Apis dorsata* came from Mr. E. R. Root, and were in alcohol. They were placed in alcohol and boiled until the tongues seemed perfectly flexible and to extend to full length. It will be noticed that the length barely exceeds that of the Italians.

I do not wish to carry the impression that I think it would not be to the advantage of a honey-bee to have an increased tongue-length, but I can hardly understand how the addition of one or two hundredths of an inch is going to help very much to gather honey from red clover. The length of the corolla-tube through which the tongue must reach, in the heads of red clover that I have examined, have varied between .34 and .37 hundredths of an inch. The extreme reach of the tongue beyond the mandibles in any bees I have measured, has been .23 of an inch. It makes me wonder if it is possible that those who think bees have gathered honey from red clover can be mistaken, and that they visit the blossoms of this plant for pollen only. This is only a suggestion, but some one who has the opportunity should settle it for a certainty.

Neither would I leave the impression that I think it impossible to breed up a race of genuine long-tongued bees, but I am very strongly of the opinion that it can only be brought about by a long process of careful selection and breeding. They will not spring into existence all at once.

Photographing a Bee—How it was Done.

BY D. W. WORKING.

READERS of the American Bee Journal may be interested in the story of the photograph as well as in the photograph itself; for it is no easy matter to pose a worker-bee just right and to get as good a picture of her as that shown on the first page of this number.

I took a number of bees to one of the best photographers in Denver—Mr. J. C. Collier—who takes pride in doing difficult work better than any body else. He shook his head, and said it would be impossible to get the bee to sit still long enough to get a satisfactory exposure. "Why not get a snap shot?" said I. Mr. Collier's look convinced me of the stupidity of my question before he had time to frame an answer. How could he get the bee into focus? I supposed the thing was easy enough—for a professional. But we took no picture that day. When I called a few days later the bees were shrunken corpses. "Too bad," said the kind-hearted picture-maker.

I wanted a photograph. So a week or two later, I caught a few more bees and carried them to the studio. Mr. Collier saw he must make me a picture to get rid of me. And at it he went! He is a patient man; has photographed dogs, cats, horses, cows, and cross babies that had to be made to look sweet. The bee was worse than any of them. I wanted something more than a life-sized portrait—as the bee-keeper will understand from the engraving—and I got it, thanks to the patience and perseverance of the photographer. But the bee was dead before we got her posed just right, with that look of honey sweetness on her face. It is the "ruling passion" strong in death. She was cross enough to look at before she died—poor thing—but it all came back in time to be caught, and forever impressed on the sensitive plate in the big camera.

In the end, the picture was taken by placing the bee between two plates of glass just far enough separated to hold her in place without squeezing her out of shape. Of course she was not arranged "just right" without many changes and readjustments. But at last she was posed as you see her—not perfectly, as she would have posed herself in life, but so nearly life-like in appearance that she is worth looking at and remembering.

Three times did Mr. Collier make a negative. The first time the plate was exposed three minutes. The result was not to his liking. Then he gave a new plate a ten-minute exposure. The result was better, but still not satisfactory. Finally, after an exposure of seven minutes by the watch, the hard lines of the old man's countenance relaxed as he looked at the plate and said: "It couldn't be better—with such light as we have." So I was satisfied. Arapahoe Co., Colo.

* The Afterthought. *

The "Old Reliable" seen through New and Unreliable Glasses.
By E. E. HASTY, Sta. B Rural, Toledo, O.

SMOKING BEES—GETTING WORKER-COMB BUILT.

Two ideas in Dr. Gallup's article, page 662, catch my attention. One is that frequent use of smoke makes bees cross. It seems to me that it must be a wrong reading of the facts that leads to that conclusion. Letting bees get the start of you undoubtedly makes them cross—and then you *have* to use much smoke—and then you can charge the smoke with the mischief which the other circumstance did.

The other idea is moving outside frames into the center to have the comb built worker size instead of drone. I feel ashamed to confess that that comes to me rather as a new idea. It worked in his case, and very likely would work in most cases. It usually *doesn't* work to take out a center comb of a colony that swarms, and replace it by an empty frame; but that is a different affair. In hiving on empty frames and letting entirely alone, the outside combs are mostly not built at all till during a strong flow they are wanted to store honey. This, of course, tends to drone-comb; while getting them built promptly, and in the center, would tend the other way, *unless drone-brood was eagerly wanted.*

CABBAGES AND LEMONS.

Cabbages two cents a pound and lemons one cent a pound, eh? Pretty good lecture on the law of demand and supply. Page 666.

FOLDED CHAFF CUSHIONS.

I can back up Mr. M. H. Hunt, page 668, that folded chaff cushions are a better fit than sewed ones—and also that mice make holes in the latter when piled to store during summer. I have used folded cushions mostly for many years.

SCREEN PORTICOS FOR HIVES.

So, with a big wire portico on the hives, bees think they can swarm, and sometimes try it and perish. Something of a drawback on the screen portico for June perambulations. I hardly think the loss of the colony would always result from such attempt to swarm. I have all along thought the screen portico the best device for shutting up bees. Didn't say much because top screens were so much more popular—and because I don't perambulate, and therefore my own experience is very scanty. Glad to see Jacob Alpaugh, of Ontario, thinking somewhat as I do. Page 669.

SWARMS GOING INTO WRONG HIVES.

"Little danger of a returning swarm getting into the wrong hive." Ah, that's where you miss it, Mr. J. B. Hall. Swarms return to wrong hive not so much because they make a mistake, as because they don't want to go home after having launched forth from it. Page 669.

SAFE INTRODUCTION OF QUEENS.

The A. J. D. Wood method of introduction is manifestly easier than caging an entire frame. I think we can accept it as nearly safe, seeing that he finds no failures. Of course, downy bees just emerged will not hurt the queen—and, equally, of course, she will quit after awhile from "acting up" and provoking assault, if she has no bee of her own near her. I should not be surprised if this should turn out the most valuable practical kink which has been brought out for a good spell. Page 670.

ALSATIANS AND THE EXTRACTOR.

And so the Alsatians, at least some of them, think we invented the extractor—probably because they imported a good one from America. Page 676.

ANCIENT TEMPLES EXEMPLIFIED IN COMB HONEY.

Mr. Ansell's ornamental work in finished comb honey is quite a triumph in its line. Some of the first great and splendid temples that were built in the world were built in that form. Perhaps he had that thought in mind when he chose the form. Pages 673 and 676.

THE HIVE KICKERS.

The hive-kickers seem to have had an inning at the convention. We see, we see. Even kicking bee-hives is all right if you do it in the right way—as Messrs. Kluck and Coggeshall doubtless do. I suppose kicking King Edward in his palace would be all right, if you did it *just right*. Page 678.

Questions and Answers.

CONDUCTED BY

DR. C. C. MILLER, Marengo, Ill.

(The Questions may be mailed to the Bee Journal office, or to Dr. Miller direct, when he will answer them here. Please do not ask the Doctor to send answers by mail.—Editor.)

Reversible Brood-Frames.

What do you think of the reversible brood-frames? How should they be used? Do you think they are of any advantage? Which is the best style to use? I have not seen anything said of them in the American Bee Journal.

NEW JERSEY.

ANSWER.—If you will turn back far enough you will find a great deal said about reversible frames in the pages of the American Bee Journal, as also in other journals. To day they are seldom mentioned. Quite a number of reversible frames were in existence, and there were also reversible hives, so that the frames could be reversed in a wholesale manner without opening the hives.

It was believed that when there was honey in the upper

part of a brood-comb, reversing would make the bees carry up the honey into the super. While that result is generally achieved by reversing there is found to be in the long run no special gain.

Another advantage was that reversing caused the bees to build their combs down to the bottom-bars—rather up to the bottom-bars. Either because that point could be gained in some other way, or because it costs more than it comes to, we hear nothing nowadays about reversing for the sake of getting frames filled out.

But the great thing that gave reversible frames and hives a real boom was the belief that by their use we had a sure means of preventing swarming. It was claimed that when a queen-cell was turned upside down the bees would not continue it to completion. Then all that was necessary to do was to reverse often enough and no queen-cells would be sealed, therefore no swarming. Like many other things in bee-keeping, it worked better on paper than in actual practice; and it is doubtful that you confind any one to-day who practices or advocates reversing as a preventive of swarming. So it is hardly worth your while to try reversible frames.

Buckwheat Sweet Clover, Etc.

1. Will buckwheat honey make suitable stores for wintering bees?

2. About how many colonies could be profitably kept where they would have a range of ten acres of sweet clover, and some outside pasturage, the ten acres to be the main pasture.

3. Would it pay to sow sweet clover for honey alone, where land would cost to rent \$2.50 per acre? ILLINOIS.

ANSWERS.—1. At one time it was said that buckwheat honey was bad for winter stores, but later observations seem to show that it is all right.

2. I don't know. One of the hardest things to find out about is the amount of nectar that can be obtained from a given area. If I should make a guess in the case, I should say that ten acres thoroughly covered with sweet clover might give profitable employment to 20 colonies of bees, but I'll not quarrel with any one who says it ought to be three times as large or three times as small.

3. I don't believe it will pay to rent land at \$2.50 an acre to sow with any crop for the sake of the honey alone. But I may be mistaken about sweet clover. I do believe, however, that by taking a crop of hay from it once each year it might be made to pay, the honey being so much extra.

Hive-Entrance in Winter—Keeping Combs of Honey, etc.

1. In looking over the "A B C of Bee-Culture," it advises leaving full width of the hive open for winter. I have mine reduced to $\frac{3}{8}$ x 2. I want to know if that is right.

2. I took off a shallow extracting super of 9 frames full of uncappped honey. I really don't know what to do with it. I suppose it will sour before spring. I have one colony in a hive tiered up (2-story dovetailed hives), or rather a Danz. hive on the bottom and a dovetailed on top, with 9 brood-frames in each, both full of honey.

3. I had two others in 2-story dovetailed hives and I put a bee-escape between them, intending to take them off the next day, but other things called me away, and when I went back in a week the honey was uncapped and gone. The bees got under the hive-cover and cleaned it up. What do you think of bee-escapes?

4. I don't think there can be any queen in the brood-nest, as I have not seen any so far, although there is every evidence that there is a queen there, but I don't know how to find her.

TENNESSEE.

ANSWERS.—1. Very likely it will be better to have the entrance open full-width.

2. The sealed honey in care of the bees will probably be all right. The combs of unsealed honey will keep all right if you can put them in a place where it is warm and dry. If that is not convenient, let them be for a day or two in the hottest place you can put them (of course not hot enough to melt the comb, then put them wherever it is convenient, so it is not in the cellar; if you find the honey seems to be getting thin, give it another roasting. As soon as bees begin to fly in spring it can be put in their care.

3. Bee-escapes are highly valued by a great many, but of course it will not do to allow bees access from the outside to any honey placed over escapes. Neither will it work well to leave honey over escapes if thieves understand the situation

Secured a Crop from Clover.

I secured a fine crop of honey from clover, but there was no fall flow except just enough to fill the hives for winter. Honey sells readily at 15 cents—some sold at 20 cents the forepart of the fall. We had plenty of rain this fall, so we are looking for a good honey harvest next year. The weather has been exceedingly fine, and we have not put the bees into the cellar yet, but there is a change to-day, and I look for colder weather soon.

I have taken the American Bee Journal for over a year, and find it very helpful. I do not see how I could do without it.

Guthrie Co., Iowa, Dec. 1.

BERT GANDER.

"The Proof is in the Eating."

A Mr. Roegmann visited me on some business the other day, and on seeing the beehives, made inquiry as to how much honey I got the past season. On being told about \$100 from 23 colonies, spring count, and an increase to 38, he could not believe it possible (as he got no honey at all); but on showing him the proof, and explaining that I was indebted to the several bee-books and bee-papers which I was reading, and after offering to return him his dollar, if, after reading it a year, he had not gotten his money's worth, or more, he decided to accept the American Bee Journal.

My bees are still on the summer stands, and have been flying nearly every day this month, though I think it has been detrimental to them. There has been but little brood reared since Sept. 15, and the warm sun has coaxed out a good many bees to perish.

Sionx Co., Iowa, Nov. 29.

F. W. HALL.

Experience with Honey-Plants, Etc.

The past two seasons we have grown clover or Rocky Mountain bee-plant, as it was so highly recommended for bee-food—"fairly overflowing with nectar." We watched faithfully, but could never discover the bees at work upon the plants, nor hovering near. We have succeeded in our selection, in growing great quantities of Scabiosa, or "Mourning Bride," and in the late summer and early fall the bees swarm around the blossoms from morning until late in the evening, and they also seem to revel among the blossoms of the Centaurea, or Bachelor's Button, and Summer Savory.

We had a real fight the past season with the moth-millers—they never were so numerous. One colony was entirely destroyed in spite of our watchfulness. After opening a hive and destroying great numbers, in a few days they were all through the hive again. The robbers were also at work—bees killed and honey taken. How can we manage to save our bees from these pests?

SARAH A. BOWERMAN.
Monroe Co., N. Y.

Wintering Bees in Chaff Hives.

Bees in this locality went into winter quarters with the stores to last them until honey comes again next year. The weather has been very fine the last week, thereby enabling the bees to have good flights, and to reach the watering-places. Some three or four days ago I noticed dandelions still in bloom. I am wintering a part of my apiary in chaff hives, with the upper story packed with chaff over the frames, and leaves on the chaff. Another portion is in the single-valved Simplicity hives, with tarred paper packed clear around and over them, leaving the entrance so that the bees can get out when necessary. The tarred paper will keep off the snow and rain, and will keep the wind from

Bees and Pear-Blight.

I see there is a good deal said about the pear-blight being spread by the bees. I have seen it on trees that had no bloom, so I would say that down here it is more on the water-sprouts, where there is no bloom, than anywhere else. My observation is, that if there is a freeze after the sap is up, there will be blight, bloom or no bloom; no freeze or chill, and there will be no blight. I believe this to be the prime cause of the blight. I would like to hear from others of the same opinion. I have noticed for several years that if there is no late frost there is no blight. I like the American Bee Journal very much.

Report for the Season.

As it always interests me to read the reports of others, I feel it for granted that they also, like to hear of the success of this endeavoring to make a living through the agency of the busy bee. I secured 5500 pounds of honey (1000 being comb) from 55 colonies, and increased to 68 the past season. I had better success wintering my bees last winter than most apiarists. In these parts, losing but 8 out of 48 (they having starved), when the average loss, so far as I have been able to ascertain, was 75 percent.

I put one colony on the scales last summer. It was fairly strong, and did not swarm. The following is their record:

Date.	Net gain.	Date.	Net gain.
June 14 8 lbs.	" 25 0 "	Rain	
" 15 4 "	" 26 23 "	" "	
" 16 7 "	" 27 15 "	" "	
" 17 6 1/2 "	" 28 13 1/2 "	" "	
" 18 0 "	" 29 15 "	" "	
" 19 5 1/2 "	" 30 1 "	" "	
" 20 10 "	July 1 11 1/2 "	" "	
" 21 14 "	" 2 1 "	" "	
" 22 12 "	" 3 3 1/2 "	" "	
" 23 8 "	" 4 10 0 "	" Rain	
" 24 10 "			

Total gain, 168 pounds from alsike clover and raspberry.

July 11 4 1/2 lbs. July 14 9 1/2 "

July 16 to close of season, 27 pounds from buckwheat and goldenrod.

Total for the season, 232 1/2 pounds.

the cellar when it first began snowing, and it is pleasing to hear their merry, contented, quiet "talk" to each other, as they hang in clusters below the frames as large as the crown of a hat. Bees colonies have been left out, in chaff-packed hives, so that I can hear them die, should a day or two of warm weather occur during the winter.

G. M. DOOLITTLE.

Onondaga Co., N. Y., Nov. 29.

Experience with Bees.

I came here in March, 1900, and commenced farming on my father-in-law's place, two miles from town. My father-in-law, Abner Bliss, has kept a few colonies of bees for many years, with varying success. He became very much interested lately, however, and commenced studying the business to learn it more perfectly. As for me, I have been interested somewhat in years gone by. During the winter of 1883-84, I had the privilege of forming the acquaintance of Mr. N. Johnson, of Douglas County, who was a successful bee-keeper, and a reader of the American Bee Journal. I remember rightly. There I saw a Langstroth hive for the first time, a foundation machine, comb foundation, a press for putting it in the sections, and many other things. I had a few colonies of bees at the time, and so became much interested, but lost them in 1885. I secured a colony or two afterwards, but lost them, still I determined to try again.

Mr. Bliss told me if I would get a Danzenbaker hive he would give me a swarm to put into it. Accordingly, I sent for one and got a start again. To be safe, I thought I would better get another, which I did, and had it ready. Shortly after receiving it my son found a swarm on a hedge, and I put it in the hive. When autumn came I found the first colony had some surplus honey, but the other needed feeding, so I fed them and put them into the cellar, hung up a thermometer, and kept the temperature correct through the winter. Mr. Bliss has practiced keeping his bees in this cellar for some years with excellent success. When we took our bees out of the cellar last spring we found them in good condition, but the mice had eaten away some of the combs.

After I had secured a start in bees again I subscribed for the American Bee Journal. Mr. Bliss has the "A B C of Bee-Culture," and Doolittle's "Scientific Queen-Rearing," and I have "Langstroth on the Honey-Bee," Cook's "Manual of the Apian," and Newman's "Bees and Honey." And I read last winter.

Mr. Bliss bought 19 queens, and I & he then began making hives. We ordered sections and foundation, and I made a machine for putting in starters, which is adjustable, and works with a foot-lever and an alcohol-lamp. I think it is a success, and beats anything I have seen.

When our queens came we had "business at home" for awhile, and I think we were remarkably successful, but we do not know it all yet. I saved six queens out of six, and made some mistakes besides. We have learned something, and appreciate the assistance we get from the American Bee Journal and the books very much. Our honey-yield the past season was fair, and of very fine quality.

for 4

out the hive with combs containing some honey. A feeder was on top.

The combs were thus put on an equal footing, so far as I could determine, nearly the same amount of brood being in each comb, *a* having a little the most. Being side by side, in the middle of the frame, neither one could have any advantage in position.

July 24, at 10 a.m., I examined comb *a* and comb *b*. (I must confess that I forgot to look at them July 23.) On comb *a* I found one cell started. On comb *b* there were 28, a few of them not yet drawn out, only the cells were enlarged. I may as well say here that no other cells were started later, somewhat to my surprise. Perhaps the bees thought it was enough to start 29. All but one were completed.

In this case the bees had their choice of brood of all ages from eggs just laid to sealed brood, *creeping* larvae between the ages of one and three days. If it were true that they were in such a quandary, as they would select too old larvae, certainly one would have expected comb *a* to have greatly the preference, instead of their being content with larvae so young as 24 hours. But their general preference was for something younger than the three-day larvae—not only younger, but very much younger. Thus, they well started with a larva as old as three days. One can not be positive as to the age of that one, but one can be very positive as to the other 28. July 24, when they were inspected, not a larva on the comb could have been more than three days old, as it is not possible that a cell on that comb was at any time started with a larva beyond that age. As they well started before 10 a.m. of that day, it is certain that none of them could have been as much as three days old, and probable that most of them were much younger.

Someone may ask, "Why are you so persistent in trying to show that the universally accepted opinion is wrong? What difference does it make, anyway, or what does it do to have the truth known ought to be incentive enough. But there is something else that makes it seem to me a matter of very great consequence.

It is probable that not one in fifty of the bee-keepers of the land takes the pains to use the means that are now taught to be necessary to secure the best queens, using cell-cups, and that sort of thing. Nor will they. It looks like too formidable an affair. So 99 out of the 100 might be supposed to talk something about this fashion:

"I am told I ought to breed from my best stock. I can make queenless the colony having my best queen, and start queen-rels. and from them I can have all the queens I want. But if I do that the bees will select larvae too good for old queens, and I can't use the complicated plans that queen-breeders use, so all I can do is to go on as I have done." And that means to have his increase and his queens from swarming colonies, and from the colonies of his colonies. And so the persistence of the fallacy that queenless bees prefer too old larvae—that man out of the chance of easily improving his stock.

He should be told the truth in something like these words:

A queenless colony will rarely, if ever, prefer larvae too good for queen-rels. None of the most improved methods of modern times will produce queens a whit better than those the bees will rear in a colony you have made queenless, so long as they have young enough larvae to select from. After the larvae have become too old they may still start cells, and will produce poor queens. If you give a nucleus or a colony two or three good-looking cells, there is small chance of a poor queen. Or you may give to the queenless colony a fresh frame of brood and eggs five or six days after being made queenless, and then you need have no fear of poor cells on any of the previous frames."—DR. C. C. MILLER, in *Gleanings in Bee Culture*.

1901—Bee-Keepers' Supplies!

We can furnish you with The A. I. Root Co.'s goods at wholesale or retail at their prices. We can save you freight on ship promptly. Market prices paid for newwax. Send for our 1901 catalog. M. H. HUNT & SON, Bell Branch, Wayne Co., Mich
Please mention Bee Journal when writing.

CONVENTION NOTICES.

New York.—The 33rd semi-annual meeting of the Seneca County Bee-Keepers' Association, will be held at the Bevier House, Watertown, N.Y., Saturday, Dec. 15, 1901, at 10 a.m. 3:30 p.m. Hon. R. L. Taylor, of Michigan, will be present and address the meeting. "Queen-Rearing" a discussion opened by F. W. Whitcomb, of "Ridger," "Repairing Old Hives or Obtaining New Ones," J. C. Howard and H. L. McLellan. Dinner will be served at the Bevier House, special rates having been secured. FRED S. EMMES, Pres.

C. B. HOWARD, Sec.

Vermont.—The State Horticultural Society and the Vermont Bee-Keepers' Association, will hold a joint meeting at Vergennes, Dec. 17 and 18, 1901. M. F. CRAM, Sec.

W. Brookfield, Vt.

Wisconsin. The Wisconsin State Bee-Keepers' Association will hold its annual convention in the State Capitol, at Madison, Feb. 5 and 6, 1902. This promises to be a large convention. All are invited to attend. There will be excursion rates of 1¢ fare for the round-trip, good for all of the first week in February. N. E. FRANCIS, Pres. A. L. PICKARD, Sec.

Michigan. The Michigan State Bee-Keepers' Association will meet in convention at Petoskey, Jan. 2 and 3, 1902. This promises to be the most largely attended meeting of the Association in years. You are invited to attend. Reduced rates on all railroads; tickets can be bought Dec. 30 and Jan. 1, good to return not later than Jan. 4. There will be no cost program, but another of our "open congress" meetings. Those who have attended in the past know what the means, and those that don't should come and find out. A novel design for badge has been ordered in honor of "Petoskey." GEO. E. HILTON, Pres.

New York. Bee-keepers' meetings and institutes will be held in this State as follows: Rochester, Dec. 11; Canandaigua, Dec. 12 and 13; Rome, Dec. 14; Auburn, Dec. 15; Poughkeepsie, Dec. 16. These institutes are held under the auspices of the Bureau of Farmers' Institutes, and will be conducted by prominent bee-keepers and speakers from home and abroad. Bee-keepers are urged to attend and show by their presence that they appreciate these institutes, otherwise they will be discontinued.

W. F. MARKS.

Pres. New York Ass'n of Bee-Keepers Societies

Wanted Comb and Extracted Honey!

State price, kind and quantity.
R. A. BURNETT & CO., 199 S. Water St., CHICAGO 33At Please mention the Bee Journal.

Wanted—Honey.

Car Lots or otherwise; will pay highest market price, spot cash. Address state quantity, quality, and price desired at your station. Will send man to receive when lot is large enough to justify.
THOS. C. STANLEY & SON,
31At FAIRFIELD, ILL.

Comb Honey and Beeswax. State price desired. Inquired in Cincinnati.
Wanted G. H. W. WEBER,
43At 214-218 Central Ave., CINCINNATI, O.

The Sure Hatch.—We are in receipt of the Sure Hatch Incubator Company's fifth annual catalog. It is a book of some 100 pages, over 200 illustrations, and contains a vast amount of poultry information, plans for poultry-houses, yards, etc., chapters on practical poultry-raising, and how to make money on a small investment, etc. Look up their ad. in this issue, and write them, and mention that you saw their ad. in the American Bee Journal.

THE NICKEL PLATE ROAD
will sell tickets Dec. 24, 25 and 31, 1901, and Jan. 1, 1902, at rate of a fare and third for the round-trip to any point located in Central Passenger Association territory, account Christmas and New Year Holidays. Return limit including Jan. 2, 1902. Through service to New York City, Boston, and other Eastern points. Chicago Passenger Station, Van Buren St. and Pacific Ave., on the Elevated Loop. For further information address John V. Calahan, General Agent, 111 Adams St., Chicago. 46-19At

HONEY AND BEESWAX

MARKET QUOTATIONS.

CHICAGO, Nov. 19.—Honey is selling fairly well at about the prices that have prevailed for the last 2 months, viz: choice grades of white comb honey, 14½ to 15¢; good to No. 1, 14¢; and light amber, 13¢, with darker grades, 10 to 12¢. Extracted, white, 7½ to 7¢; amber, 5½ to 5¢, according to quality, flavor and package. Beeswax good demand at 26¢.

R. A. BURNETT & CO.

CINCINNATI, Oct. 25.—The honey market is rather dull on account of the warm weather. Extracted sells only to manufacturers from 55¢ to 60¢; better grades alfalfa water-white from 60 to 7¢; white clover from 58 to 60¢. Fancy white comb honey sells from 13½ to 15¢.

C. H. W. WEBER.

ALBANY, N. Y., Oct. 25.—Honey in good demand now, as this is the most satisfactory time to sell. Grocery men are stocking up and retail buy lines, when late they only buy enough to piece out. Fancy white comb, 15 to 16¢; mixed, 14 to 15¢; buckwheat, 12 to 13¢. Extracted, white, 7½ to 7¢; mixed, 6 to 6½¢. H. K. WRIGHT.

OMAHA, Oct. 25.—New comb honey is arriving by express in small quantities from Iowa and Colorado, and selling at \$1.50 per case, retail value. California extracted honey is being offered carlots at 4½ to 4¼¢ per pound, f.o.b. California shipping points, but we have not heard of any sales having been made thus far. The production of extracted honey seems to be quite large this year in Colorado, Utah and California. PEYCKE BROS.

NEW YORK, Nov. 8.—Comb honey is in good demand, and while the market is not overstocked, receipts are expected to be only the demand. Fancy white sells at 15¢, with an occasional sale at 16¢ for attractive lots. No. 1, white, at 14¢; No. 2, at 13¢; fancy buckwheat, 11 to 12¢; No. 2, and 3, at 10 to 11¢. Extracted remains quiet at 17 to 18¢ for white, and 5½ to 6¢ for amber. Very little demand for dark at 5 to 6½¢. Beeswax quiet at 26 to 27¢. HILDETH & SPOELKEN.

BOSTON, Nov. 20.—The demand for honey is easing up, somewhat due in part to the holiday season at which time it is less neglected. Our market at the present time runs low. For strictly fancy in cartons: No. 1, 14 to 15¢; No. 2, 12 to 13¢; No. 3, 10 to 11¢. Extracted, light amber, 7½ to 8¢; amber, 7¢. BLAKE, SCOTT & LEE.

DES MOINES, Oct. 25.—There is very little doing here in new crop of honey. Some small lots of nearly produced comb honey are on the market and selling in a retail way at \$3.50 per case. We do not look for much trade in this line before Sept. 1. Our market does not consume a great deal of extracted honey.

PEYCKE BROS. & CHASEY.

DETROIT, Oct. 25.—Fancy white comb honey, 14 to 15¢; No. 1, 13 to 14¢; no dark to quote. Extracted, white, 6 to 7¢. Beeswax, 25 to 26¢. M. H. HUNT & SON.

SAN FRANCISCO, Nov. 25.—White comb, 11 to 12½¢; amber, 8 to 10¢; dark, 6 to 7¢. Extracted, white, 5½ to 6¢; light amber, 4½ to 5¢; amber, 4 to 5¢. Beeswax, 20 to 22¢.

Not much doing in this corner, but there are no large stocks here of any description, and current values are being, as a rule, well maintained. There is more moving outward at present from our market than inward, and some from here. Some capitalists are reported holding back supplies, anticipating better prices in the spring.

KANSAS CITY, Oct. 25.—Up to the present time only small lots of new comb honey have been on the market, and these met with ready sale. The bulk of the demand is for fancy white. For next week heavier receipts are expected and quotations are issued at \$3.00 to \$3.25 per case for large lots, which would be equal to about 14 to 15¢; the demand being quite brisk, a firm market is anticipated. Inquiries for extracted are a little more numerous, but large buyers still seem to have their eyes too low. In a small way 5½ to 6¢ is quoted.

PEYCKE BROS.

FARM RAISED POLLY

PAWS RISE. Always strong and vigorous. Sold by the bushel. Low price for high quality. Raised stock. Got our new Polly from a well-known flock with poultry. Worth \$25, but sent only 15¢. JOHN BAUSCHER, JR., BOX 94, FREEPORT, ILL.

A New Bee-Keeper's Song—

"Buckwheat Cakes and Honey"

Words by EUGENE SECOR.

Music by GEORGE W. YORK.

This song was written specially for the Buffalo convention, and was sung there. It is written for organ or piano, as have been all the songs written for bee-keepers. Every home should have a copy of it, as well as a copy of

"THE HUM OF THE BEES in the APPLE-TREE BLOOM"

Written by
EUGENE SECOR and DR. C. C. MILLER.

PRICES—Either song will be mailed for 10 cents (stamps or silver), or both for only 15 cents. Or, for \$1.00 *strictly in advance* payment of a year's subscription to the American Bee Journal, we will mail both of these songs free, if asked for.

Texas Bee-Keepers.

New Branch Office. We beg to announce the opening of a branch office and warehouse at 48 W. Houston St., San Antonio, Texas. Rates of transportation from Medina in less than car-load lots are high, and it takes a long time for a local shipment to reach Southern Texas points.

Low Freight and Quick Delivery.

To secure these two necessary advantages—low freight and quick delivery—and to be better prepared to serve the interests of our Texas friends, is our reason for establishing this new branch office. No other point in Southern Texas is better adapted to serve as a distributing point than San Antonio. It has four great railroads—the Southern Pacific R. R. east and West—the International and Great Northern R. R. from Laredo up through San Antonio and Central Texas, the San Antonio and Arkansas Pass R. R., and San Antonio and Gulf R. R. It also has the American, Wells-Fargo and Pacific Express Companies.

Our Managers.

We have secured as managers Mr. Udo Toepperwein, formerly of Leon Springs, and Mr. A. V. Walton, Jr., both of whom are well known to the bee-keepers of South and Central Texas. They are also thoroughly familiar with practical bee-keeping and all matters associated with it, and any orders sent to this branch will receive prompt, careful attention.

Our Goods.

As usual our motto is to furnish the best goods of the most approved pattern. We do not undertake to compete in price with all manufacturers. Bee-keepers have learned that it does not pay to buy cheap supplies, for a saving of 10 cents on the first cost of a hive may be a loss of many times this amount by getting poorly made and ill-fitting material. Every year brings us many proofs that our policy of "the best goods" is a correct one.

Our Catalog.

Very few changes in prices will be made in our new catalog, so do not delay your order, but send it at once. You will be allowed a refund if lower prices are made, and in case of higher prices ruling in the new catalog, if any, you will secure the benefit by ordering now. Catalog and estimates may be had by applying to the address given below.

Our Invitation.

Whenever you visit San Antonio you are invited to call at our office and make it your headquarters. Here you will find a display of Apianian Supplies not equaled elsewhere in Texas. You will also find on file the leading bee-journals to pass pleasantly your leisure time.

Spanish Catalog.

Some of you may read Spanish, or have a bee-keeping friend who does. If so, call for our Spanish catalog. It's sent free.

FORTY-FIRST YEAR
No. 51.

WEEKLY

APIARY OF MISSES AUDREY AND ADNAH YOUNG,
OF SPOKANE CO., WASH. — (See page 804.)

THE AMERICAN BEE JOURNAL

PUBLISHED WEEKLY BY

GEORGE W. YORK & COMPANY
144 & 146 Erie St., Chicago, Ill.

Entered at the Post-Office at Chicago as Second-Class Mail-Matter.

EDITORIAL STAFF.

GEORGE W. YORK, Editor-in-Chief.

DR. C. C. MILLER, Department
E. E. HASTY, Editors.
PROF. A. J. COOK, Editors.

IMPORTANT NOTICES.

The Subscription Price of this Journal is \$1.00 a year, in the United States, Canada, and Mexico; all other countries in the Postal Union, 50 cents a year extra for postage. Sample copy free.

The Wrapper-Label Date of this paper indicates the end of the month to which your subscription is paid. For instance, "dec 01" on your label shows that it is paid to the end of December, 1901.

Subscription Receipts.—We do not send a receipt for money sent us to pay subscription, but change the date on your wrapper-label, which shows you that the money has been received and duly credited.

Advertising Rates will be given upon application.

National Bee-Keepers' Association

OBJECTS:

- To promote and protect the interests of its members.
- To prevent the adulteration of honey.
- To prosecute dishonest honey-dealers.

BOARD OF DIRECTORS.

E. WHITCOMB,	THOS. G. NEWMAN,
W. Z. HUTCHINSON,	G. M. DOOLITTLE,
A. I. ROOT,	W. F. MARKS,
E. T. ABBOTT,	J. M. H. HAMBAUGH,
P. H. ELWOOD,	C. P. DADANT,
E. R. ROOT,	DR. C. C. MILLER,

EXECUTIVE COMMITTEE.

ERNEST R. ROOT, President.
R. C. AKIN, Vice-President.
DR. A. E. MASON, Secretary, Toledo, Ohio.
EUGENE SECOR, General Manager and Treasurer, Forest City, Iowa.
MEMBERSHIP DUES, \$1.00 a year.

☞ If more convenient, Dues may be sent to the office of the American Bee Journal, when they will be forwarded to Mr. Secor, who will mail individual receipts.

A Celluloid Queen-Button is a very pretty thing for a bee-keeper or honey-seller to wear on his coat-lapel. It often serves to introduce the subject of honey, and frequently leads to a sale.

NOTE.—One reader writes: "I have every reason to believe that it would be a very good idea for every bee-keeper to wear one of the buttons as well as cause people to ask questions about the busy bee, and many a conversation thus started would wind up with the sale of more or less honey; at any rate it would give the bee-keeper a superior opportunity to enlighten many a person in regard to honey and bees."

The picture shown herewith is a reproduction of a motto queen-button that we are furnishing to bee-keepers. It has a pin on the underside to fasten it.

Price, by mail, 6 cents; two for 10 cents; or 6 for 25 cents. Send all orders to the office of the American Bee Journal.

BEST Extracted Honey For Sale

ALL IN 60 POUND TIN CANS.

Alfalfa Honey

This is the famous White Extracted Honey gathered in the great Alfalfa regions of the Central West. It is a splendid honey, and nearly everybody who cares to eat honey at all can't get enough of the Alfalfa extracted.

Basswood Honey

This is the well-known light-colored honey gathered from the rich, nectar-laden basswood blossoms. It has a stronger flavor than Alfalfa, and is preferred by those who like a distinct flavor in their honey.

Prices of Alfalfa or Basswood Honey:

A sample of either, by mail, 10 cents, to pay for package and postage. By freight—two or more 60-pound cans of Alfalfa, 7½ cents per pound. Basswood Honey, ½ cent more per pound than Alfalfa prices. Cash must accompany each order. You can order half of each kind of honey, if you so desire. The cans are two in a box, and freight is not prepaid.

Order the Above Honey and then Sell It.

We would suggest that those bee-keepers who did not produce enough honey for their home demand this year, just order some of the above, and sell it. And others, who want to earn some money, can get this honey and work up a demand for it almost anywhere.

GEORGE W. YORK & CO., 144 & 146 Erie St., Chicago, Ill.

The Novelty Pocket-Knife.

Your Name and Address on one side—Three Bees on the other side.

[THIS CUT IS THE FULL SIZE OF THE KNIFE.]

Your Name on the Knife.—When ordering, be sure to say just what name and address you wish put on the Knife.

The Novelty Knife is indeed a novelty. The novelty lies in the handle. It is made beautifully of indestructible celluloid, which is as transparent as glass. Underneath the celluloid, on one side of the handle is placed the name and residence of the subscriber, and on the other side pictures of a Queen, Drone, and Worker, as shown here.

The Material entering into this celebrated knife is of the very best quality; the blades are hand-forged out of the very finest English razor-steel, and we warrant every blade. The bolsters are made of German silver, and will never rust or corrode. The rivets are hardened German silver wire; the linings are plate brass; the back springs of Sheffield spring-steel, and the finish of the handle as described above. It will last a last-time, with proper usage.

Why Own the Novelty Knife? In case a good knife is lost, the chances are the owner will never recover it; but if the "Novelty" is lost, having name and address of owner, the finder will return it; otherwise to try to destroy the name and address, would destroy the knife. (If traveling, and you meet with a serious accident, and are so fortunate as to have one of the "Novelties" your POCKET-KNIFE will serve as an identifier; and in case of death, your relatives will at once be notified of the accident.)

How appropriate this knife is for a present! What more lasting memento could a mother give to a son, a wife to a husband, a sister to a brother, or a lady to a gentleman, the knife bearing the name of the recipient on one side?

The accompanying cut gives a faint idea, but cannot fully convey an exact representation of this beautiful knife, as the "Novelty" must be seen to be appreciated.

How to Get this Valuable Knife.—We send it postpaid for \$1.25 or give it as a Premium to the one sending us a NEW SUBSCRIBER to the Bee Journal (with \$3.00). We will club the Novelty Knife and the Bee Journal for one year, both for \$1.50.

GEORGE W. YORK & CO.

St. Chicago, Ill.

☞ Please allow about two weeks for your knife order to be filled.

ESTABLISHED IN 1861 **BEE JOURNAL** THE OLDEST BEE-PAPER IN AMERICA

41st YEAR.

CHICAGO, ILL., DECEMBER 19, 1901.

No. 51.

✻ Editorial. ✻

That Hoary Lie about the adulteration of comb honey seems still to retain much vigor. Here is a sample of its cat-like vitality, kindly sent to us by Chas. F. Hoser and others:

On my vacation in Michigan last summer I got some real honey—the real sweet kind, with a comb that chews up beeswax. It was so good that for three months after I came back I tried to get, in Chicago, some honey, but I could not find it. Of course, every grocery store had what it said was strictly pure honey, in the nicest looking combs—too nice looking; it was plain that it was all manufactured. A few days ago my grocer told me he had some real honey this time. I was certain of that, too, as soon as I saw it. I have worked with bees and know the ear-marks of their handiwork, and that comb was just irregular enough, imperfect enough in places to fool me. I bought two pounds. And when I got it home and took a mouthful the honey was not very sweet—it was a poor grade of glucose; and the comb melted in my mouth—it was paraffin.

No fading away of vigor about that, is there? Indeed, it has gained a robustness that exceeds its former self; for in former stages it only claimed that a minor part of the comb honey in Chicago was adulterated; now there is none of the genuine to be found in Chicago, although it be sought carefully for three months!

The amazing part about it is that this vigorous slander is not found in some obscure place, spoken by some ignoramus in the country grocery at the crossroads, but it is an opinion delivered in all seriousness before a body of supposedly brainy men. It is an extract from a paper read by the proprietor of the Farmer's Call, at the annual meeting of the National Agricultural Press League, and published in that sprightly periodical, Agricultural Advertising, published by Frank B. White Co. Mr. Frank B. White is well known as a man of untarnished reputation, and the soul of honor. Taken altogether, after so many years of battling with a great wrong, bee-keepers may be excused for feeling just a little discouraged as to getting anything like a semblance of justice.

More may be said of this hereafter.

Influence of the Queen.—There has been some discussion as to whether the queen or the workers has the most influence upon the character of young royalty, some asserting that when black workers rear a queen from the egg of an Italian queen it would be the same as if reared by Italian queens, while

others say the black nurses make of it a different being. Very far from this last view is that put forth in this country and in Europe, that a queen not only influences the character of her own off-spring, but produces in some way, by her presence, a direct change upon the workers of another queen. The assertion is made that when the queen of a very cross colony is removed, and a queen of gentle stock introduced, not only will the colony be gentle when all the old workers have died off, but the crossness will all disappear within two or three weeks from the introduction of the new sovereign; in other words, while the bees of the cross colony are daily hatching out, and as yet there is not a single worker of the new colony.

As the newspapers say, "This needs confirmation;" and it would be well if those who have the opportunity would observe at what time a change of deportment may be seen when a gentle queen is put in place of a cross one.

Brood-Frame End-Spacers.—Opinions of bee-keepers are not so diametrically opposite as to many things as they are about the change made in frames which shortens the top-bars and depends upon staples driven into the end-bars to hold the frames in place lengthwise. Some claim that the change is a real boon. The bee-space at the ends of the top-bars prevents deposition of glue at that point, making it much easier to handle the frames. Others say the staples are constantly driven further in, and as soon as driven in far enough there is the worst kind of trouble. The difference in the thickness of top-bars or end-bars may account for the difference of opinion. With a top-bar less than half an inch in thickness, and a $\frac{1}{4}$ -inch end-bar, the staple will not be firmly held, and will soon be out of place. With a thick end-bar, or with a top-bar so thick that the staple will be driven through the end-bar into the top-bar, there ought to be little or no trouble.

A Swarming Story.—The following has been sent to us as the report of something remarkable:

A BEE STORY. James D. Noland, an 80-year old farmer of Pike township, has had an unusual experience in his apiary this month. On Sunday, June 9, a swarm of bees came from one of his hives, and on Monday, Tuesday and Wednesday following, swarms came out of the same hive four swarms in four consecutive days. Mr. Noland succeeded in saving all of them, and all were large, vigorous swarms, and are reported doing well at this time. This is a bee-swarming story not likely to be beaten.—Coshocton Democrat.

There is nothing remarkable in having four swarms on four successive days from the

same colony. When bees are allowed to swarm at their own sweet will, there may be a prime swarm, and then three or four after-swarms, possibly five or six. If anything should happen to the old queen, or if for any reason she should not be able to accompany the swarm, the prime swarm would return, and a week or more later a swarm would issue with the first young queen; and this would be likely to be followed by several after-swarms. But it is an unusual thing for any swarm after the second swarm to be a large one, and to have four swarms in succession from the same colony all "large, vigorous swarms," would be something so far out of the usual that one may be excused for supposing that there was in the case a reporter with a "large, vigorous" imagination.

Control of Fertilization. If secured, might not bring all the success expected from it. In a former number of this journal Adrian Getaz wrote:

"If we could breed from an individual drone of our choice, how could we tell that this drone would give better workers than that one?"

Quoting this, Mr. Simpson, in the Bee-Keepers' Review, calls it an overwhelming truth, and says:

"That is the fundamental fact on which I base my contention that fertilization in confinement is not the *sine qua non* (without which nothing) of successful queen-breeding."

When to Extract Honey.—A writer in Gravenhorst's Bztg. says: "I extract from combs that are mostly sealed. In order to find in the lower part of the comb, where the cells are yet unsealed, honey sufficiently ripe. I use the morning hours for extracting. Early in the morning there is found in the combs no thin nectar to shake out easily and excite robbing. All the nectar gathered the previous day is somewhat thickened. If several rainy days occur, then the morning of the first flight-day after the rainy spell will find the unsealed honey as thick as that which is sealed."

Weekly Budget.

THE MICHIGAN CONVENTION is to be held Jan. 1 and 2, 1902, at Petoskey. We have received a very cordial invitation to attend, and accompanying it there was one of the most beautiful lodges we have seen in a long time. We would like very much to be there.

but it is quite impossible for us to leave our office at that season of the year.

A number of the more prominent bee-keepers are to be present, and no doubt one of the best conventions of the year will result. Pres. George E. Hilton knows how to plan for a successful meeting. There will be reduced rates on all the railroads leading to Petoskey. See particulars on another page.

The closing paragraph of the letter we received, reads as follows.

There is no place like these conventions for exchanging views, receiving and imparting knowledge, and as we are all more or less dependent on each other, let us meet in that spirit of friendship and harmony that has always prevailed at our meetings, and make it possible for us to go back to our homes and tell our friends that we were glad we went; that it was just that "best of reason and better of soul" that we needed.

Better go, if you can, and help make it the best that the Michigan Association ever held. Beginning with the Buffalo convention, there have been some good meetings of bee-keepers this year. The Colorado, Chicago, Minnesota, and Ontario, were all exceptionally fine ones, we understand. Of course, we know that the Chicago was all right, as all will agree when they read the full report to be published in these columns later.

APIARY OF THE MISSES YOUNT is shown on our first page of this week. There are 7 hives that do not show. The girl with the mandolin in her band is Miss Adnah; the other is her older sister, Miss Audrey. These young lady bee-keepers hope by another fall to send us a picture showing 60 colonies. Miss Audrey now owns 6 colonies, and Adnah, 21 colonies. We wish them every success in their effort to become leading bee-keepers in their great State.

MR. W. A. PRYAL, whose bees are in Alameda Co., Calif., writing us Dec. 6, had this to say:

I was over to the old place yesterday, and I noticed that the bees were working as merrily as they would be in March. They had many kinds of flowers to work upon. The winter has been a mild one so far. We have had no really cold weather yet. This morning has been the first cold so far this season. You may know how warm it has been when I inform you that tomato plants are still green and fresh in the open ground. California is growing grandly, and blooming as if it were spring.

In this portion of the State the rains so far have been liberal. I might say, abundant. Within the fraction of an inch the rainfall has been the same as up to the same time last year. The difference in the two years is that it has not been so cold, and we have not had so much fog. Though for a day or two last week we had fog that was worse than anything we had for years past. It was in one of these fogs one ferry boat on San Francisco Bay ran into and sank her sister boat of the same ferry. This was the first accident of the kind in over 20 years; the former was not attended with loss of life, while four are accounted as lost in this last disaster.

I noticed by last night's paper that the lower counties of the State have been having some heavy fogs too. One of the very best counties in the State prides itself on the amount of its fogs. This county has an abundant crop every year. I refer to Sonoma county, a short distance north of this city. The south has had but little rain so far, as the reports show, but in good time I am sure a fair amount of rain will visit that portion of the State. W. A. PRYAL.

The Buffalo Convention.

Report of the Proceedings of the Thirty-Second Annual Convention of the National Bee-Keepers' Association, held at Buffalo, New York, Sept. 10, 11 and 12, 1901.

(Continued from page 790.)

FEEDING BEES FOR WINTER.

"Would heavy candied combs of honey alone, be safe to winter bees on, or cakes of candy alone, be safe, without any combs of honey?"

A. I. Root—I think the most successful feeding I did was with cakes of maple sugar. I have taken late colonies in the fall with almost no combs at all, and laid cakes of maple sugar over the frames and wintered them all right. But there is a good deal of difficulty about wintering bees without combs; if the candy gets damp and sticky, the bees will stick to it and will die, and if they get the dysentery they will die. Candied honey is not exactly satisfactory, but sometimes it will answer. In sugar feeding, sometimes the sugar candied in the combs, and I have known the bees to let a lot out on the bottom and then seem to die for want of moisture. The difficult thing is to furnish enough moisture along with the feed. Up here in New York State where you have colonies by the hundreds or thousands you cannot bother with candied honey. Maple sugar is a very nice thing to build up colonies where they are short of stores. I put it in the fall and left it on all during the winter, and in the spring when they have been short of stores I have put it over the frames to stimulate them. One of our most successful bee-keepers in Ohio wrote to me that she had 50 or 60 colonies of bees, and they were short of stores. I told her to buy cakes of maple sugar and put over the combs, and she said that she had one of the biggest yields that they had in Ohio. She attributed it to the maple sugar, but it needs watching and care.

BEE-STINGS AND THEIR REMEDIES.

"What can we do if badly stung? Should every bee-keeper have a bottle of ammonia? How is it administered? What is to be done to a horse when badly stung?"

W. L. Coggsball—I never had any horse stung.

Mr. Niver—I cover up so I don't get stung.

W. L. Coggsball—I feel as if I had been very successful in that line. I have handled a good many bees and we haven't had any accidents yet.

A Member My mother was very badly stung at one time when she lived a swarm of bees, and they gave her salt and water to keep the poison from her stomach as much as possible, and we saved her life in that way. It was done by a professional nurse.

Mr. Alpaugh—I have a remedy from an outsider that doesn't keep bees, that is a complete one, which is simply a little coal-oil.

Mr. Baldrige—My son was stung when very much heated, just under the chin, and so much affected that he swelled all over. We sent for the doctor at once, but before he arrived my son vomited and the swelling went down at once.

Mr. Longnecker—A remedy which I have seen used is to bathe the part with a strong solution of soda. It is very cooling and satisfactory.

Mr. McElvoy—The doctors generally recommend aromatic spirits of ammonia, half a teaspoonful; and if it doesn't work in a few minutes—don't wait long—repeat it.

Dr. Mason—I believe that whiskey is better than ammonia.

Mr. Fuller—My remedy is chloroform. Just a few whiffs inhaled always relieves me.

SECTION SIZE—BLEACHING HONEY.

"Which is preferable, the 4's, or the 4x5 section?"

Dr. Mason—That depends upon locality.

"Can extracted honey be bleached? If so, how?"

W. J. Craig—It can be improved. We have had extracted honey exposed in a room where the sunshine could penetrate and we found that the honey which we had exposed in that way was much lighter within a week than the same honey which was confined in a dark place. We put it in 5 or 10 lb. cans.

EXTRACTING HONEY—COMB HONEY GRANULATING.

"In running for extracted honey, should one spread the combs, and then when uncapping cut deep?"

W. L. Coggsball—I spread six or seven combs and uncapped them evenly.

"What is the cause of comb honey in sections becoming granulated soon after being removed from the hive, or much earlier in the season than in former years, in some localities?"

Mr. Fuller—My experience is with comb honey, if you will keep it at a temperature of about 92 to 95 degrees it won't granulate.

COMB-HONEY BEES.

"What strain of bees is the most profitable for comb honey?"

Mr. Alpaugh—I would say a good cross between Italian and a black. Blacks are very good of themselves, but I don't like them, for the reason that they are a little awkward to handle; but I do think that a good cross between an Italian and a black would be all right.

Mr. Baldrige—I like good yellow-colored Italians for all purposes.

Mr. West—The best that I have seen

for the past two years was a cross between the Carniolans and the Italian.

Huber Root—I have found a cross between a Carniolan and an Italian a good cross.

Mr. Fuller—I can get the best results by having full-blooded Italian queens and let them mate as they please.

Mr. Greiner, chairman of the committee on the score card, then handed in their report, but not being quite completed it was left in the committee's hands to be completed and forwarded to the secretary.

Mr. McEvoy moved that the report be accepted as read. Mr. Smith seconded the motion, which was carried.

The convention then adjourned to meet at 8 p.m., at the Epworth Hotel, in Joint Session with the American Pomological Society.

(Continued next week.)

Condensed Report of the Illinois Bee-Keepers' Convention.

The Illinois State Bee-Keepers' Association met at Springfield, Nov. 19 and 20, 1901, and was called to order by Pres. J. Q. Smith. The forenoon session was mostly spent in visiting and getting acquainted, except the usual preliminaries—secretary's report, and reports of committees.

The afternoon session was called to order by Vice-Pres. S. N. Black.

DARK UNCANDIED HONEY.

"What is the dark mixture in honey that does not candy?" was asked. It was too hard a question to receive an answer till Mr. Smith came in. He said his bees stored quite a lot of that kind of honey one year, and he found, on the alighting-board, dust from the milk-weed, and there was a great field

of the weeds in full bloom; and he found his bees working on it strong.

Mr. Black—I have seen bees fastened on milk-weed blossoms, and dead.

Mr. Smith—That honey did not candy.

FERTILIZATION OF WORKER-EGGS.

Geo. Poindexter had illustrations of his own pointing in evidence of the Wagner theory of the fertilization of the worker-eggs, and not of the same for the drones. He thought the theory was correct.

Mr. Black did not think the theory was correct, as he had seen where the queen had laid fertile eggs in cells so near the edge of the comb as not to have depth enough to cause the contraction of the queen's abdomen in depositing them; others had seen the same thing.

HONEY-DEW, ETC.

"Is there such a thing as real honey-dew, aside from the so-called 'bug-juice'?"

Many illustrations were given to prove that there was, and it was unanimously decided that there was real honey-dew honey, and that of good quality.

"Do bees always select their place of destination before swarming?"

Arguments were advanced to prove both sides, and the question is still open for argument. Mr. Black cited a case where bees surely went 20 miles across a prairie.

SECOND DAY.

The meeting was called to order by Pres. Smith, and a discussion was opened on the premium list. Mr. Black moved that the executive committee, which is the President, Secretary and Treasurer of the Association, be made the premium-list committee, and that the revision of the same be left to them. Carried.

Mr. Becker moved that the meeting proceed to election of officers for the ensuing year, which was carried, and resulted as follows:

President—J. Q. Smith; 1st Vice-Pres.—Miss L. C. Kennedy; 2nd Vice-Pres.—S. N. Black; 3rd Vice-Pres.—A. N. Draper; 4th Vice-Pres.—George Poindexter; 5th Vice-Pres.—P. J. England, Secretary—Jas. A. Stone, R. K. 4, Springfield; Treasurer—Chas. Becker.

CELLAR WINTERING OF BEES.

"Is it best to put bees into the cellar in this latitude?"

Several said no, not if well protected.

Mr. Smith—I just take slats out of the super, cover the brood-frames with a piece of gunny, then fill the super with dry leaves, and I never lose any.

LONGER-TONGUED BEES.

Mr. Draper—"Do we need longer-tongued bees?"

Mr. Black—Yes. The reason our Italians store honey from red clover is that our soil is so worn that it does not produce clover-heads as large, with as deep cups, as it did of old.

Secretary—I think the whole cause is the energy of Italian bees, that force the cups open so that they reach the nectar just as easily in the largest heads as in the small ones. I have watched them and seen them go as readily to the largest heads as to any other.

Mr. England—I think we need longer-tongued bees.

Messrs. Smith, England and Poindexter reported good crops of honey this year.

The executive committee chose for the date of the meeting next year, the third week in November, Tuesday and Wednesday, the 18th and 19th.

On motion the convention adjourned.

JAS. A. STONE, Sec.

Contributed Articles.

No. 4.—APICULTURE AS A BUSINESS.

Localities With Limited Pollen Supply—Slow Flows and Effects—Why Failures Are Made, and the Far-Reaching Effects.

BY R. C. AIKIN.

I HAVE previously referred to a fact which I think is generally conceded, that alfalfa is a slow yielder of honey, and so far as I know, I have never seen a bee with a plump pellet of alfalfa pollen. I think if bees were to depend up on alfalfa pollen they would starve, if a lack of it would starve a colony. In the matter of pollen, there is never a superabundance of it in my locality—and this is true of many other Colorado fields, and at times there is a dearth of it both in and out of the hives.

Pollen, in early spring, has much to do in the matter of building up a colony, and have them in good condition when the flow comes. Here, there is no pollen in the fields until about April 15, nor is there much, often none, in the hive, either. To supply the need, bees are greedy for anything in the nature of flour, getting into chop-feed bins, into horse feed

troughs, mills and granaries, in fact wherever any floury substance is found. I have seen them raking dust out of rotten wood, sawdust, and such. Unless the matter is looked after by the apiarist, his stock is behind, and that is what happens with bee-keepers who are not apiarists.

There is also a considerable part of all the spring up to June 10 to 15 in which there is no nectar coming in. I call attention to these facts to show that it is business to look after details, more so when Nature does not provide these. To allow a colony to lie in a listless condition through the weeks just preceding a honey-flow is not business, yet there is more or less of that condition in our springs here unless obviated by the apiarist. Some writers advocate a severe letting alone in the spring, saying nothing is gained by opening of hives, feeding or manipulating. If your field has supplied plenty of pollen in the fall, and if in the early spring and generally previous to the honey flow there is pollen and nectar coming in to stimulate breeding; and, if there is enough open comb in the right position to keep the queen fully supplied with laying-room, then there is not much gained by manipulation or feeding. It is a business matter to know the things that tend to make a success, and getting hosts of bees before the honey-flow is one of the biggest things of the business, and is not looked after by the average apiarist.

Having failed to get as many bees as might have been obtained, the flow begins with weak colonies. Supers will be put on, but work will not be begun in them, and apiarists—or rather, bee-keepers—wonder why the bees are not doing much. They are packing the brood combs with honey, and while the queen wants to lay freely she cannot because she has no more empty comb in the brood-chamber, and they go about with sacs full of honey, secrete wax freely, start queen-cups, feed their limited amount of brood freely, queen lays in the queen

cups, and so swarming conditions go on rapidly. The colony not having become strong enough to go out freely into sections, the conditions for swarming develop the more rapidly, and much swarming and little honey results.

Let me make a contrast. Suppose a honey-flow comes with a rush, and in about 5 or 6 days the brood-chamber is full. This, with the great activity and overburdened honeysacs, crowds the bees to the supers. It is a fact, that colonies that will not touch super-work with a slow flow, in a more rapid flow but other conditions equal, will go right into the sections. Here also is another fact, when the flow is too weak or slow to cause the colony to enter the super, a few more bees added will accomplish the result. If this be true, then we can understand how I may get a medium or fair crop when some one near me, not taking advantage of the stimulating features that may be applied to advantage in this locality, would not have any marketable honey.

I know that my part of Colorado, and some other parts, too, do have these slow, tedious honey-flows. While in the white clover and basswood regions apiarists have rapid spurts of honey-flow, in which one or more supers will be filled in as many weeks, and even very much less time, we here find our super-work going much more slowly. I find that for one flow that will fill two supers in a month, there are several that do less. I also find that a colony that swarms, and new swarms as well, do not one in five, nor more than once in five years, give me a profitable yield. Swarming colonies, to be profitable, (except to sell the increase to prospective apiarists at big prices), must be doubled, or lived in contracted brood-chambers. So true is this that I say, *emphatically*, the person paying \$5 a colony for bees, and then allowing the bees to swarm and *not practicing some method of contracting or doubling colonies to get strength*, cannot make the business at all profitable.

I want to repeat and emphasize, that when the honey-flow is slow and intermittent, very much more skill is required in management if one gets a fair product, both in finish and quantity. As intimated heretofore, as the flow is slow or weak the colonies must be of greater strength, both to get them to work in the supers at all, and to get quality and finish. A rapid, full and steady flow causes work to begin more evenly through a super, and not only to be begun, but to go on regularly and evenly; but, in contrast with this, when the flow is weak and nectar coming in slowly no matter whether the slow work is caused by a *weak colony* or a *lack of nectar*, the work is of a very irregular and unsatisfactory character. The results are so marked that in the hands of an expert apiarist these weak flows may be made to produce good, marketable honey that brings fair to good prices; while in the hands of those not learned in the science, the product, if marketable at all, must be a drug upon the market and at bottom prices.

I do not write these things to keep people from going into the business, but that when they do go in they do it more carefully and intelligently. People entering the business and upon business principles, and handling it in a way to succeed, need be no detriment to others in the business; but to rush in and fail, injures not only themselves, but others dependent upon them, and the general public, and damages very materially others in the same business. If a failure affects solely the person making it, then the good-will towards others and desire that they be kept from suffering and distress, would be the only reason why we need concern ourselves about the matter; but the person making a failure makes it harder for others, in several ways. A failure in any enterprise leaves the person failing less able to buy other products, he is less of a help in a community, because he has not money nor ability to make a community prosperous. Usually, a business failure leaves the one failing unable to pay all his bills, and these unpaid bills cripple and injure others in their business.

Just now I have in mind a man who this past summer engaged to take care of a lot of bees for my neighbor. He came to me to buy hives, and was sure he wanted 50, for, said he, "There are 50 colonies and they will all swarm at least once." He did not have the money, but would pay September 1. I suppose he intended to sell honey to pay for the hives, and had great visions of the income he was to get from those bees. The time is now six weeks past the date at which he was to pay, and payment not made. I do not think his crop of honey will pay even the expenses for supplies, while he has nothing for time and trouble, and this, too, when I persuaded him that he would best not buy more than 25 hives instead of the 50 he wanted. He did not use even the 25. I am out the cost of 25 hives. The man owes me the price of them, and has no crop to pay it out of; the little honey he has will not bring a living price in any market; and the owner of the bees gets nothing on the capital invested.

I could have handled those bees at a profit to both myself

and the owner, but, handled as they were on altogether a wrong and unscientific basis, several people are the worse off because of the unbusinesslike procedure. Those bees have not profited either the owner or the manager, and they have used a part of the pasturage that would have been beneficial to me and to others.

Larimer Co., Colo.

Moving Bees Short Distances.

BY C. F. DADANT.

WOULD it be safe to move 20 colonies of bees now, or would I better wait till I pack them for winter? I have to move them only 20 feet north and 20 feet east.—JOHN T. PATTIN, Johnson Co., Iowa, October 17, 1901.

As there are many such enquiries, I will give my manner of moving bees, and the reasons for it, in more detailed form than in the private reply I gave to Mr. Pattin.

When we move our bees, we must bear in mind the instincts and habits of the worker-bees. At its first flight, out of the hive, the young bee takes a survey of its location by flying in circles slowly and carefully, evidently to examine all surrounding objects, and these first flights of young bees, which always take place early in the afternoon of a warm day, are well known to apiarists, because usually several hundred, and sometimes several thousand, bees thus take flight almost at the same hour, and their actions somewhat resemble those of the robber-bees that circle about to recognize the spot where they have found honey. But the robber-bee is restless and hurried, and to a certain extent feels ashamed and acts more or less sneakily, while the young bees have a contented, peaceable flight, like the actions of a being whose conscience is at ease, and whom nobody pursues.

At the second flight, the young bee still looks about, but with much diminished care, as it feels more sure of its location. After that, the worker-bee strikes out like an arrow, without looking behind. Its flight is so nearly straight that the expression, "take a bee-line," is equivalent to saying, "take a straight, short course over hills and valley."

When we move our bees it is important that we should remember this. If the hives are moved during cold weather, so that before they take a flight they have had time to forget the slight disturbance; or, if we move them during warm weather so carefully that they do not realize that anything is wrong, we may very positively expect that when they issue out of the hive they will do as usual—take a bee-line without stopping to look back. If the hive has been changed in position a short distance, they will vainly seek it on the old spot, and will wear themselves out in a short time, unless one of the hives is within reasonable distance, when some bees may find it and will attract the others by the drumming of their wings. But many will get lost, and if the wrong hive is entered many will be killed.

If, on the other hand, we take pains to let the bees know that the hive is being moved, by closing up the entrance and leaving it closed quite a while after the hour when they might take flight during a fairly warm day; if we handle the hive somewhat roughly while they are thus confined, and do not release them till they have all been warned that something is wrong; if we also give them a few puffs of smoke when releasing them, and if they are enabled to take flight at once, and look over the ground, it is quite likely that the most of them will fully realize the fact that their location has been changed, and we may rely on their natural intelligence to find the spot again. And as many of the bees do not take flight at once, even after a rough shaking up, it is well to leave with them a reminder of their change of location, so that when any bee goes to the door, it may at once realize that things are not what they were. This reminder we put in the shape of a board leaned up against the hive, in front of the entrance, so that the bee may be prevented, at the start, from flying in a "bee-line," toward the fields. This obstruction, of course, causes the worker to look back and investigate, as soon as on the wing, and the new location is thus more sure of being noticed.

Yet in spite of all these precautions, some bees may hover about the old site and insist on going into a cluster, especially if any empty hive or box is left where their home stood. Should any great number thus congregate, they may be given to one colony at night-fall, and with this colony they will be sure to remain.

But if the above-given instructions are carefully followed, no bad results need be feared. As a matter of course, this evidences the necessity of moving the bees at a time when they can still fly, and during such weather as will not be likely to chill them if they remain longer than usual on the wing, as

they are sure to do in any case, owing to the surprise that the change will cause among them.

These precautions are of more importance if the bees are carried only a few feet, than if they were taken to an entirely new location, for in the new location there is no spot to which they have been accustomed, and they are more readily induced to come back to the place whence they have issued, without seeking any other.

Now, to evidence the success of the above-given method, I quote below an extract from the second letter of the man whose enquiry led to this article:

JOHNSON CO., IOWA, NOV. 12, 1901.

MR. C. P. DADANT—DEAR SIR:—You requested me to let you know what luck I had in moving my bees according to your instructions. I received your reply October 18, and the next morning turning out beautiful, I went right to work. The first thing I did was to shut them all in, then carried them to their new stand and set them down rather roughly; I was glad they were shut in, for they made an awful fuss.

The next thing I did was to tear down everything around their old location that I possibly could, after which I put boards, saw-horse, wash-tubs and limbs of trees, or any old thing I could lay hands on, in front of the hives on the new stand, and kept them shut in until noon, then let them out. The first colony started out too lively for me, so I concluded to smoke the rest, and it was just the thing, for it made them hang around better even than the first colony. I watched them until sundown, and a few went to the old stand, but I don't believe I lost a dozen bees out of my 20 colonies. . . . I am just through reading the American Bee Journal, Vol. 28, 1883 to 1897, which were given me, and I think I must have this paper, for I got more information out of those I have been reading than I ever would out of books, for out of books I get one man's idea, while out of a good paper I get the ideas of many writers.

Yours truly,

JOHN T. PATIN.

This letter is conclusive as to the method I recommend. It has been tried many times, but the latest testimony is always the best.

Hancock Co., Ill.

Swarming—Eucalyptus Trees—Balling Queens.

BY DR. E. GALLUP.

THE remarks of Mr. E. E. Hasty, on page 633, seem to call for something more from me. I had to cut down four eucalyptus trees and move three colonies—one 12 feet, one 25, and one 33. The first two I shook into the clustering-box early in the morning, before the bees were out to work; the last was a very strong colony, and I did not get to work with it until afternoon, consequently a strong force was out in the field. Of the first two, not a bee went back to the old stand; the other kept coming in until nearly night, but I leaned the em. ty clustering-box against the fence, and the bees hazed about, finally clustering in it, when I carried them to the new stand and shook them in front of their hive; the following day not over half a dozen bees returned to the old stand. It was a novel sight to see from two to three quarts of bees together, and nearly every one loaded with different-colored pollen.

THE EUCALYPTUS TREE.

Now, a little about the eucalyptus tree. Eight years ago last July I set out 80 small seedlings, and now one of the four we cut into stove-wood measured 21 inches across the stump, 12 inches from the ground, the tree measuring 80 feet in length. The eucalyptus blossoms from December to March, so the bees are humming on it all winter. I have often wondered why bee-keepers do not plant a grove near their apiaries. They are self-irrigating after the first season, as the leaves condense the moisture from the atmosphere at night, and one often sees puddles of good size under the trees in the morning. My trees have never been irrigated, except a few wettings with a pail the first season, soon after they were set out. Eucalyptus makes the best of fire-wood, and if cut in the winter the stumps send up sprouts from 8 to 15 feet in length the first season. The leaves and twigs make the finest kind of kindling for starting a fire.

MIXED SWARMS BALLING QUEENS.

Mr. Hasty may be right about a lean honey-flow, but I have succeeded here and in Iowa, and will give my experience.

In Ventura County, early one morning, a large prime swarm issued and clustered in a big live-oak tree. I cut the limb and let it down to within four or five feet of the ground and fastened it there. I then shook the bees into a clustering-box and carried them to a hive; while doing this, out came an after-swarm and clustered on the same branch. Well, I soon had fun enough, for I had 14 or 16 (I have forgotten which, it is so long ago) swarms come out, and sometimes three or four after-swarms were in the air at once. They all clustered on the same branch, but as soon as I would see a great rush to the cluster I would shake them into the box, and from that into a hive placed on the cover, and then closed the hive with a quilt or blanket to keep out the swarming bees. After the

seance was over, I had a tremendous pile of bees. I shook them into a large clustering-box and then uncovered the swarms to see if they had queens; I found them all right and quiet except one.

In the clustering-box I found a balled queen rolled down to the bottom end of the box. I took a long-handled one-quart dipper (which, with me, is one of the necessary implements about an apiary), scooped up the balled queen, filled the dipper with bees from the lower part of the cluster, and carried them to the queenless swarm; I poured them down at the entrance and ran them in.

The next performance was to examine every swarm, adjust the frames, and see which needed more bees. Some had plenty and some were quite small in numbers. The next performance was to get bees from the large cluster and equalize things. To avoid getting the queen I would dip from the lower part of the cluster, as the queen almost invariably keeps near the top. I am positive about this from actual experience in, I might say, hundreds of cases. I scooped them up with the dipper into a small box so as to know how many I wanted, by measure, to equalize each swarm. I then carried them to the hive and poured them down at the entrance. After the equalizing was done I hived the balance, taking care that the queen ran in with the bees, and so knew that all was right thus far.

The next operation was to insert a frame containing eggs and unsealed larvae in each colony; so if any queen is lost on her wedding-flight we can soon tell by their starting queen-cells—I found cells started in one colony the sixth day.

Now, Mr. Hasty, if you know of a case of bees being more mixed than in the above, please "Gallup" it out. In all my experience, I can recall but two cases where they may have killed their last queen by balling, and in both of these cases they might have been lost on their wedding-flight. At all events, I found no dead queens in front of the hives, which we can almost invariably find in a clean yard, if we look carefully. You will also notice that I shook that balled queen mentioned above right down in front of the hive, without taking the trouble to liberate her. The bees were run into a hive without combs and no other queen. It is a ground hog case with them, and they seem to realize it almost instantly.

Now, what are you going to do about it?

Orange Co., Calif.

Questions and Answers.

CONDUCTED BY

DR. C. C. MILLER, Marengo, Ill.

(The Questions may be mailed to the Bee Journal office, or to Dr. Miller direct, when he will answer them here. Please do not ask the Doctor to send answers by mail.—EDITOR.)

Rearing the Best Queens.

Can we not get a long-tongue bee, healthy bee, ambitious worker—and all of these considered good and useful qualities—by some one that can control the mating fairly well? Breed, or mate, the queen with the drone from her sister worker? It looks to me as if there would be a gain of at least one-half of a bee-generation, in the preservation of the good qualities of the workers.

Ohio.

ANSWER.—The project of having some one make a business of rearing queens on a large scale in something like the way you mention has had some consideration, but as yet nothing has come of it. It is true, however, that some able men are engaged in rearing queens which they are trying to bring up to the requirements you mention, and there is constantly approach to the highest standard being made.

Starting With Bees.

I would like directions for a beginner to start with bees in the spring, in northern Illinois. I know nothing about bees. How should I proceed in order to insure the best success. Please give explicit directions.

I. G. NORACE.

ANSWER.—I don't know. I'd give a good deal if I did, I've been trying for years to learn just what is the very best way to do to insure success, but I'm not always sure of success. Sometimes this season is so bad that I can lay my failure on

tively at its door. Sometimes I get a notion that some new way will be an improvement, and it turns out so poorly that I wish I hadn't tried it on so large a scale. But I'll tell you just what I think I would do if I were to begin all over again.

The first thing I would do would be to get a good text-book and study it with care. In that you ought to find much or all of the "explicit directions" you ask for. Then if you expect to go into bee-keeping somewhat extensively it will be well to get another text-book and study that. Also read with interest what you find given weekly in the *American Bee Journal*, and perhaps in other journals. Thus you can spend a very profitable winter, and at the opening of spring be much better prepared to care for your bees than you are now. In the course of your readings you will find some things hard for you to understand. After you have puzzled over them a reasonable length of time, write for answer in this department. Don't be afraid to ask questions. That's what this department's for. But there are two kinds of questions that may be well for you to steer clear of.

One kind of questions to avoid is the kind that you find fully answered in every text-book. Such, for instance, as: "Do the drones lay eggs?" How long is it from the time the egg is laid till the young worker hatches out?"

The other kind of questions to avoid is the kind that is too comprehensive, including those that expect an answer without giving particulars. In this category would come the question: "Give explicit directions for getting a big crop of extracted honey." What is the reason my bees stored no honey this year?"

Then when spring opens up, and you begin work with the bees, keep referring to your text-book, and keep asking questions. I'll try and find answers for all that are not too hard.

Moving Bees in Winter.

I expect to move 150 miles west about December 20, and want to take my 45 colonies of bees. I expect to charter a car. Can they be moved successfully at that time? Iowa.

ANSWER.—Something depends on the weather. If it should be exceedingly cold, the combs will be brittle, and there will be danger that some combs may be broken. I can give you little light additional to what you find in the books, the chief points to look after being: To have the frames stationary in the car; to have plenty of ventilation (although much less ventilation is needed than in hot weather); and to see that the hives are loaded into the car so that the ends of the frames point toward the engine.

Wintering Bees in the Cellar.

I put 36 colonies of bees in the cellar this fall, raising them one inch from the bottom-board. I put burlap over the frames, and supers without the slats, filling them with chaff. For ventilation I left the covers off. Is this a good way? Wisconsin.

ANSWER.—The preparation you have described is all right, and is a good deal more preparation than many feel necessary, for bees will winter well with the covers sealed on when there is plenty of opening below. Read carefully what your bee book says about temperature and ventilation of the cellar.

Feeding Bees.

When, what and how can I feed my bees? I have two colonies of Italians, and have had them about eight months. I get lots of information from the *American Bee Journal*, but it seems to be far advanced bee-keepers. Missouri.

ANSWER.—This department has its field and its limitations, and it is not hard to account for the fact that some things will not be found in it, nor indeed in any part of the Journal. There are some things many things, which every bee-keeper should know when he enters the business. If these things were told in these pages, it would take several numbers without leaving room for anything else. By the time they were all told a new set of subscribers would want them begun over again, and as new subscribers are coming in all the time the *American Bee Journal* would be entirely occupied printing over and over again the same things. To avoid this, instruction books or text-books on bee-keeping have been published, and one of the first things for a beginner in bee-keeping to do is to get one of these text books and become familiar with its contents. After he has done this he

will find plenty of questions still that he would like to ask, and the very fact that there is no need to repeat the things in the text-book makes it possible to answer more full upon any point not fully treated in the text-book.

Upon consulting your text-book you will find that the best time to feed bees is much earlier in the year than December; and that the best thing to use for feed is combs of sealed honey; and the best way to feed these is to put them directly in the brood-chamber, in or close to the cluster of bees. Of course, much minute information is also given, which would occupy pages, and after you have studied it all carefully it is quite possible you may desire light upon some point not given, and these columns are freely open to answer any further questions you may have. If your bees do not have enough to carry them through the winter, combs of sealed honey may be yet given, the next best thing being candy.

* The Home Circle. *

Conducted by Prof. A. J. Cook, Claremont, Calif.

KINDNESS AND TRUST.

It was a blessed hour. It was a good day. Where? At the Bible class. One felt lifted up. The good words spoken, the impulses felt, the resolves felt but unspoken, came like an inspiration to the nearly two score in that class. Dear friends of the home circles, do you enjoy such hours, such days, such times of precious uplift? I covet for all of you the very best gifts, and none more than that these so wholesome and so precious Bible study hours may make in your lives the best sympathy, love and trust.

It was our last hour with the great Joseph. And wasn't he great? He could bravely push away temptation, and bave none of that bitterest grief of yielding to wrong impulse. He could fill a life of bitterest trial and misfortune in most useful work, so that a prison became an opportunity. Work and sympathy for others are good and probable companions. Of course, he made friends of all whose lives he touched. Worked on ability and kindness of heart, which grew and ripened fast with much of exercise, made him touch with blessings great and many all such lives.

Best of all, Joseph was great enough to forgive the sorest and most grievous wrongs, and by kindness he strove to bury the memory of the evils in the thought of those who wrought them. The full forgiveness was more to those brothers whose murderous thoughts and deeds struck so cruelly at this splendid brother, than was the corn of the full granaries of Egypt. That only fed the bodily life; the other, the spiritual; and the brothers were all saved to work evil no more.

Sunday we discussed the problems of kindness to evil-doers, and the great power of trust and confidence. Joseph gives one of the most glorious examples in history of kindness to those, his brethren, too, who had raised the murderous hand against him. And the results, as always, proved the glory of such conduct. We rightly expect the best love, sympathy, and appreciation from our brothers and sisters. Failure in this usually works havoc. The one wronged feels bitter, strikes back harder blows, if he may; and that worst—the family feud—blackens history's page. Joseph struck no blow, but overcame evil with good. It was a proud day for the world when he, in its full view, set this grand example. Christ did more gloriously. He breathed that marvelous prayer of forgiveness, with far worse evils heaped upon him; and when death—their awful fruitage—was pushing life from his poor, suffering body.

How well for us all to read oh, so often—until it is firmly lodged in memory's pages, those last words of that best of chapters of the best of books—Matthew 5th. The thief steals our coat; we must give him our cloak. We must have the impulse not to curse, not to curse, but to enfold in kindness' arms, and to bless with sympathy and love. Why is "Los Miserables"—Victor Hugo's great novel—the greatest ever penned? Only because it reveals the power of kindness, and love to awaken manhood, and to save a life from sin and give it to God. The bishop, by his great heart of love, which could only sympathize and desire to help the poor convict who had suffered such terrible and multiplied wrongs, won a great soul back to virtue and to God.

I like to read those last verses of Romans 12th. Paul was a master soul. That whole chapter is grand; the last

verses urge grandly to just this blessed life of forgiveness. I wish all the children of our great country might learn the great sermon, which was spoken from the Mount. As also Romans 12th, and 1st Corinthians 13th. The last is our college chapter here at Pomona College. If we could all learn those chapters, and catch practically their spirit, how quickly we would solve not only the question of anarchy, but of all sin and evil.

One in our large class said, "Be kind when the desire to be forgiven was shown." I did not admire his words or spirit when he replied to the question, "What will bring the sorrow for sin and a right repentance so quickly as to be enfolded in the arms of love?"—"I might put one arm about a wrong-doer, but I would keep the other ready for other and possibly wiser use." This remark leads to our second topic—

TRUST AND CONFIDENCE.

If we are suspicious, as voiced in the arm ready to strike, we shall never win. If we trust our children; our students, if we are teachers; our neighbors; if we show a kindly confidence we will find them slow to betray such trust. We must keep the confidence of all these; we can not expect what we do not give.

Jacob died. The brothers remembered their grievous offense—their awful sin toward Joseph—they were afraid. With no occasion they suspected Joseph. He was full of sadness. Is there one thing in this world that saddens like the lack of trust, confidence, and belief in one's integrity of purpose from those we love? In age such a sorrow would press hardest. And so Joseph met life's evening hour with a real heart burden. What a awful arraignment of evil! It companions with distrust and suspicion, and thus it weighs heavily even the best and truest friend.

SPORTS.

To-day our college is to meet on the football field the Indians—a very noted band of redskins who can play football. For years we have not lost a game. Last year we met this same team and vanquished them with a score of 16 to 0. This year we are stronger, yet we are not sure. "When ye think ye stand, take heed lest ye fall." Last night we all—students and faculty—held in the gymnasium a meeting to arouse enthusiasm, and give courage to the team, whom we all believe in. We know they have practiced hard. We expect they will be victors. The team expects to win; the coach knows they will; we all feel confident. Even the girls are keenly appreciative of good, hard, honest work, as a bright, witty speech from one last evening evinced.

A professor spoke. He showed that one ought never to become so old that he would not find play-sport a pleasure. He said: "We wish you to be defeated when a rival from harder, truer work has won a right to victory." All applauded, but the cheers rang out with merrier, louder note when he

added, "but we do not expect defeat. Your hard, telling work makes us all very expectant."

We all encourage the games, and all pure, honest athletic sports. None who do not reach high grade in studies can take part in the games. We believe these contests are good and helpful, and that they make better, stronger men.

IS PERFECTION DEMANDED OR EXPECTED?

I have received the following from one of the American Bee Journal subscribers, for reply in this department:

On page 682, Prof. Cook, in discussing the matter of voting the prohibition ticket, says: "God does not demand perfection in any of us. 'Only one, your Father in heaven, is perfect.'" I do not know who is the author of the words quoted by Prof. Cook, and I do not undertake to dispute them, but I do know that it was the great Preacher in his sermon on the mount who said: "Be ye therefore perfect, even as your Father which is in heaven is perfect," and I have always had a feeling that nothing short of perfection on my part would be entirely satisfactory. In my efforts at perfection I have not made an entire success, so it will be something of a relief if a let-up in my efforts is allowable. What I want Prof. Cook to tell me is, just how much short of perfection is demanded of me. If I understand him correctly I am not required to do all I can to kill the saloon, but may stop short of voting against it. But I would like to know whether the requirement comes so near perfection that it will prevent me from taking a glass now and then.

IMPERFECTION.

I am glad "Imperfection" makes these inquiries. His very name shows that he sympathizes with my position. One said to Christ, "Good Master." He answered, Call not me good. Only one is good, your Father in heaven. Yet, this same blessed Savior said, "Be ye perfect even as your Father in heaven is perfect." I hope I am wrong, but from my own experience from Paul's words—"When I would do good, evil is present with me;" from all my observation from the whole trend of the Scriptures, I am led to question the possibility of a perfect life in this world. Did not Christ, in his "Be ye perfect" mean to give us this as the ideal? Maybe very late in life, just at the margin of the river, some are so happy as to reach this ideal. I trow, however, that it only comes as we reach the other side.

Are we not happier as we strive harder to reach the ideal? To let go this effort would only mean less of joy, less of satisfaction. "Imperfection" would find no relief in any abatement of effort. Our joy doesn't come that way.

Ah, my friend! I do not misunderstand me greatly. You—we all—are required to do all in our power to kill the saloon, and any other damnable evil. But it is not my duty to condemn you if your method and mine are not the same. If all the good and the true are in the Prohibition party, then, surely, we are in sorry plight. I do not believe all the wisdom is there. Does "Imperfection?"

REVERSIBLE WALL MAP

—OF THE—

UNITED STATES AND WORLD,

WITH SPECIAL INSET MAPS OF

China, Cuba, Porto Rico, The Philippines, Hawaii, and Alaska,

Especially prepared to meet the demand for a first-class map that will give a quick, general idea of location of events the world over, and particularly to the United States and our territorial possessions. **Very useful in every Home and Office.**

66 x 46 INCHES IN SIZE.

ELEVEN BEAUTIFUL COLORS.

**Best and Most Necessary Map
Ever Issued.**

**No Home or Business House
should be without it.**

The XXX Plates

are works of art. The engraving is plain, bold, and decisive. The color work is elegantly contrasted, but not gaudy.

Perfection and Artistic Elegance

a salient feature of this map not approached by any similar publication.

AXXX Marginal Index

is one of the invaluable features.

It gives an alphabetical list of countries, their location on map, style of government, population, area, products, minerals, imports, exports, etc.

It has been pronounced a **Photograph of the World**

The 1900 Census
of the largest American Cities is given.

One side shows a grand map of our great country, with counties, railroads, towns, rivers, etc., correctly located. The other side shows an equally good map of the world. Statistics on the population, cities, capitals, rivers, mountains, products, business, etc., a veritable photograph of the UNITED STATES AND WORLD.

The map is printed on heavy map paper and is mounted on sticks ready to hang. Edges are bound with tape.

1901 EDITION.—Every reader should consult it every day. The plates show all the new railroad lines and extensions, county changes, etc. Especial attention is given to the topography of the country; all the principal rivers and lakes, mountain ranges and peaks are plainly indicated. The leading cities and towns are shown, special attention being given to those along lines of railroads. The Canadian section of the map gives the provinces of Ontario, Manitoba, and British Columbia, with nearly all of Quebec and New Brunswick; the county divisions being clearly marked. The Southern portion of the map includes the Northern States of the Republic of Mexico, and the Bahama Islands.

On the reverse side is the Library Map of the World. The largest and most accurate map on Mercator's Projection ever produced. The political divisions are correctly defined and beautifully outlined in colors. The ocean currents are clearly shown and named. Ocean steamship lines with distances between important ports are given. A marginal index of letters and figures enables one easily to locate every country in the world. A series of short articles in a alphabetical order is printed around the border of this map in large, clear type, containing valuable information concerning agriculture, mining, and manufacturing statistics, also the value of imports and exports in dollars. The area, population, form of government, and chief executive of every country in the world is given up to date, also the names of the capitals and their population. **The Inset Maps** are elegantly engraved and printed in colors. They are placed in convenient positions around the United States map, and will be invaluable to every person desiring a plain understanding of our possessions. An inset map of China on the World side of map adds to its value.

Two maps on one sheet, all for only \$1.50, sent by mail or prepaid express; or we will forward it free as a premium for sending us Three New Subscribers at \$1.00 each; or for \$2.00 we will send the Map and the American Bee Journal for one year.

main honey month. I had but a few colonies, and about one-fourth as much honey as the previous season. I have some black, some hybrid, one Italian, and two Carniolan colonies. The blacks gave me no surplus at all. I bought an Italian queen last year, and that colony produced three or four times as much honey as any of the rest, with the exception of one or six out of about 50 colonies. They gathered some honey nearly as bright as castor-oil; I never saw any like it before, and do not know what they gathered it from.

Most of my bees spent the season rearing queens, I think. I, for one, do not want my queens clipped. I am a farmer, and can not be here all the time. If the queen can fly they will settle and wait till I come home. If they are clipped they will come out and go back before I can get there. I lose one now and then, but I like them to be able to fly.

I have just read Mr. A. E. Isaac's report in the American Bee Journal for Nov. 21, in which he mentions his honey having a sour smell. I notice it here every year, I think, but I do not know what causes it. Bees gather bitter honey here nearly every fall, but none of mine ever candies.

Several bee-keepers have asked Dr. Miller about late drones this fall. My bees reared a lot of them very late. I think it was because they had a very good flow of bitter honey.

This is my first year with Carniolan bees, and I do not know whether I will like them or not. I bought an Italian queen last summer, and she seemed to be all right until a few days ago, when I missed her, and found sev-

eral sealed queen-cells. But it is too late for them to rear one.

I think the staple-spaced frame is the best here. We have too much sweet-gum for any other.

Mr. Brown, in speaking of Mr. Gerold's loss by melting down, said that if he will raise his hives on benches, and put a roof over them, he will have a comfortable hall for his bees. I had part of mine on a small pole on the ground, in the hot sun. It was 100 to 108 degrees the past summer. I used an inch plank on the hive, and an inch one on top of that, and they came through all right.

My bees are in very good shape for winter.

Hale Co., Ala., Nov. 28. J. S. PATTON.

Growing Pepper-Trees in Illinois.

I have some pepper-trees growing in a box; the seed was sent to me last winter by a friend in California. When I work and water them I think of Prof. Cook. I make trees my companions, and I will take these with me to Florida, to see if they will flourish there.

Report for 1901—Hive-Covers.

I harvested 2150 pounds of honey, 400 being extracted. The buckwheat crop was short on account of rain. I packed 37 colonies for winter, having introduced 16 new queens this fall. My honey was all sold three weeks ago,

FOR GETTING NEW SUBSCRIBERS.

Red Clover Queens FOR 1902 Free

Long-Tongue Variety—Warranted Purely Mated.

We have already arranged with the queen-breeder who furnished Long-Tongue Red Clover Queens for us during the past season, to fill our orders next season. Although fully 95 percent of the unmated queens he sent out were purely mated, next season all that he mails for us will be **warranted** purely mated.

We want every one of our present subscribers to have one or more of these money-maker Queens. We have received most excellent reports from the queens we supplied during the past season. And next year our queen-breeder says he expects to be able to send out even better Queens, if that is possible. He is one of the very oldest and best queen-breeders. His bees average quite a good deal the longest tongues of any yet measured. The Breeder he will use is direct from Italy, having imported her himself. Her worker-bees are large, of beautiful color, very gentle, scarcely requiring veil or smoke.

Orders for these fine, "long-reach" Warranted Queens will be filled in rotation—"first come, first served"—beginning as early in June as possible. It is expected that orders can be filled quite promptly (even better than the past season), as a much larger number of queen-rearing nuclei will be run. (But never remove the old queen from the colony until you have received the new one, no matter from whom you order a queen).

All Queens will be guaranteed to arrive in good condition, and will be clipped, unless otherwise ordered.

A Warranted Queen for sending us Only 2 New Yearly Subscribers

In order that every one of our subscribers who wants one of these Warranted Queens next season can easily earn it, we will book your order for one queen for sending us the names and addresses of **two new subscribers** to the American Bee Journal and \$2.00. FURTHERMORE, we will begin to send the Bee Journal to the new subscribers just as soon as they are received here (with the \$2.00, and continue to send it until the end of next year, 1902). So, forward the new subscriptions soon—the sooner sent in the more weekly copies they will receive.

This indeed is an opportunity to get a superior Queen, and at the same time help swell the list of readers of the old American Bee Journal.

We are now ready to book the Queen orders, and also to enroll the new subscriptions. Remember, the sooner you get in your order the earlier you will get your Queen next season, and the more copies of the Bee Journal will the new subscribers receive that you send in. We hope that every one of our present readers will decide to have at least one of these Queens. Address,

GEORGE W. YORK & CO., 144 & 146 ERIE STREET, CHICAGO, ILL.

Langstroth on... The Honey-Bee

Revised by Dadant—1900 Edition.

This is one of the standard books on bee-culture, and ought to be in the library of every bee-keeper. It is bound substantially in cloth, and contains over 500 pages, being revised by those large, practical bee-keepers, so well-known to all the readers of the American Bee Journal—Chas. Dadant & Son. Each subject is clearly and thoroughly ex-

plained, so that by following the instructions of this book one cannot fail to be wonderfully helped on the way to success with bees.

and I am still getting orders for more, and I didn't have to advertise, either. I was out on the mountains last week on a hunt, and shot a very fine doe that weighed, dressed, 103 pounds. It was the first deer I ever saw, and I shot it from a distance of 112 yards. I have seen so much discussion about roofs of late that I would like to say a word about covers. There is no flat cover in this country that will stand without warping or checking. I cover all my gable covers with red roofing paper and paint them. I make the gable covers by taking a 6-inch board for the ends, then cover with shingles and paint, for the flat top. I then put the roof on over that flat cover, allowing it to extend two inches at the ends and sides. My colonies are always dry and nice. They are cooler in summer and warmer in winter, and the cost is only a trifle. Clearfield Co., Pa. G. W. BELL.

Yellow Sweet Clover—Sainfoin.

I tried a very small quantity of yellow sweet clover seed sent out for the first time two years ago, but I have since left the part of the country I was then in. I found the seed all it was recommended to be, coming into bloom on June 10, so that the bees would work on it, and with the help of white sweet

BEE-BOOKS

SENT POSTPAID BY

George W. York & Co.

Chicago.

Bees and Honey, or Management of an Apiary for Pleasure and Profit, by Thomas G. Newman. It is nicely illustrated, contains 160 pages, beautifully printed in the highest style of the art, and bound in cloth, gold-lettered. Price, in cloth, 75 cents; in paper, 50 cents.

Langstroth on the Honey-Bee, revised by Dadant.—This classic in bee-culture has been entirely rewritten, and is fully illustrated. It treats of everything relating to bees and bee-keeping. No apiarist library is complete without this standard work by Rev. L. L. Langstroth, the Father of American Bee-Culture. It has 520 pages, bound in cloth. Price, \$1.25.

Bee-keepers' Guide, or Manual of the Apiary, by Prof. A. J. Cook, of the Michigan Agricultural College.—This book is out only instructive and helpful as a guide in bee-keeping, but is interesting and thoroughly practical and scientific. It contains a full delineation of the anatomy and physiology of bees. 460 pages, bound in cloth and fully illustrated. Price, \$1.25.

Scientific Queen-Rearing, as Practically Applied, by G. M. Doolittle. A method by which the very best of queen-bees are reared in perfect accord with Nature's way. Bound in cloth and illustrated. Price, \$1.00.

A B C of Bee-Culture, by A. I. Root.—A cyclopedia of 400 pages, describing everything pertaining to the care of the honey-bees. Contains 300 engravings. It was written especially for beginners. Bound in cloth. Price, \$1.20.

Advanced Bee-Culture, Its Methods and Management, by W. Z. Hutchinson.—The author of this work is a practical and entertaining writer. You should read his book 90 pages, bound in paper, and illustrated. Price, 50 cents.

Rational Bee-Keeping, by Dr. John Dzierzon.—This is a translation of his latest German book on bee-culture. It has 350 pages, bound in paper covers, \$1.00.

Bienen-Culture, by Thos. G. Newman.—This is a German translation of the principal portion of the book called Bees and Honey. 108-page pamphlet. Price, 25 cents.

Bienenzucht und Honiggewinnung, nach der neuesten methode (German) by J. F. Eggers.—This book gives the latest and most approved methods of bee-keeping in an easy, comprehensive style, with illustrations to suit the subject. 50 pages, board cover. Price, 50 cents.

Bee-Keeping for Beginners, by Dr. J. P. H. Brown, of Georgia.—A practical and condensed treatise on the honey-bee, giving the best modes of management in order to secure the most profit. 100 pages, bound in paper.

Bee-Keeping for Profit, by Dr. G. L. Tinker.—Revised and enlarged. It details the author's new system, or how to get the largest yields of comb or extracted honey. 80 pages, illustrated. Price, 25 cents.

Apiary Register, by Thomas G. Newman.—Devotes two pages to a colony. Leather binding. Price, for 50 colonies, \$1.00; for 100 colonies, \$1.25.

Dr. Howard's Book on Foul Brood.—Gives the McCoy Treatment and reviews the experiments of others. Price, 25 cents.

Winter Problem in Bee-Keeping, by G. R. Pierce. Result of 25 years' experience. 30 cts.

Foul Brood Treatment, by Prof. F. R. Cheshire. Its Cause and Prevention. Price, 10 cts.

Foul Brood, by A. R. Kohlenk. Origin, Development and Cure. Price, 10 cents.

Capsons and Caponizing, by Dr. Sawyer, Fanny Field, and others. Illustrated. All about caponizing fowls, and thus how to make the most money in poultry-raising. 64 pages. Price, 25c.

Our Poultry Doctor, or Health in the Poultry Yard and How to Cure Sick Fowls, by Fanny Field. Everything about Poultry Diseases and their Cure. 64 pages. Price, 25 cents.

Poultry for Market and Poultry for Profit, by Fanny Field. Tells everything about Poultry Business. 64 pages. Price, 20 cents.

GREIDER'S FINE CATALOGUE
of prize winning poultry for 1902, printed in colors, of breeds and new breeds, of varieties, poultry, game fowls, and all the latest and best. May include poultry raises. Send 10c in silver or stamp for this catalogue.

47—50A3t

clover, which bloomed well into September, there was nothing left to wish for. I find that cattle and horses will eat sweet clover greedily where pasture is scarce, both as pasture and as hay. I made one experiment that satisfied me that it is all right. A few good-sized armfuls of sweet clover had been cut and allowed to lie on the ground about three days. I picked it up and threw it to a neighbor's cows. I then got a dish of water and put a handful of salt into it, then sprinkled the clover with the salted water. Those cows, with pasture all around them, devoured the sweet clover (it had stood from 4 to 6 feet high before cutting, with stalks half an inch thick) just as greedily as the finest hay. Yet I have seen sweet clover in a field, with cattle running at liberty, stand unmolested, and attain a growth of six feet, while in a neighboring field it was eaten to the ground, scarcely getting a chance to blossom and seed.

For myself, I think the American Bee Journal did a great kindness in introducing this yellow sweet clover to the notice of bee-keepers.

I would like to know if any one has made an extended trial with sainfoin, esparcette, or holy hay (it bears all three names). Mr. Dadant mentions it in one of his contributions to the American Bee Journal as being quite productive of honey in France. I tried it last year; it came up nicely, and the young clover plants looked like little branches of the black locust with their leaves

IF IT'S MADE

in a better way, and of better material, as it really is, then you can see how it has become so popular. **PAGE MOVEN WIRE FENCE CO., ARLING, MICH.** Please mention Bee Journal when writing.

—THE—

The Bee-Keeper's Guide;

Or, Manual of the Apiary.

—BY—

PROF. A. J. COOK.

460 Pages—16th (1899) Edition—18th Thousand—\$1.25 postpaid.

A description of the book here is quite unnecessary—it is simply the most complete scientific and practical bee-book published to-day. Fully illustrated, and all written in the most fascinating style. The author is also too well-known to the whole bee-world to require any introduction. No bee-keeper is fully equipped, or his library complete, without **THE BEE-KEEPER'S GUIDE**.

This 16th and latest edition of Prof. Cook's magnificent book of 460 pages, in neat and substantial cloth binding, we propose to GIVE away to our present subscribers, for the work of getting NEW subscribers for the American Bee Journal.

Given for TWO New Subscribers.

The following offer is made to PRESENT subscribers only, and no premium is also given to the two NEW subscribers—simply the Bee Journal for one year:

Send us TWO NEW SUBSCRIBERS to the Bee Journal (with \$2.00), and we will mail you a copy of Prof. Cook's book FREE as a premium. Prof. Cook's book alone sent for \$1.25, or we club it with the Bee Journal for a year—both for only \$1.75. But surely anybody can get only TWO NEW SUBSCRIBERS to the Bee Journal for a year, and thus get the book as a premium. Let every body try for it. Will YOU have one?

GEORGE W. YORK & CO.,
14 Erie Street, CHICAGO, ILL.

No. 4 "Barler Ideal" Oil-Heater.

The "Barler Ideal" OIL-HEATER

**Saves Its Cost Every Year!
NO ODOR! NO SMOKE! NO ASHES!**
Costs only a cent an hour to run it.

The editor of the American Bee Journal is using the "Barler Ideal" Oil Heater, and it is all right in every way. We liked it so well that we wanted our readers to have it too, so we have recently arranged with its manufacturers to fill our orders. The picture shown herewith is the one we recommend for general use. It is a perfect gem of a stove for heating dining-rooms, bed-rooms, and bath-rooms. It hinges back in a substantial way, and is thoroughly well made throughout. The urn removes for heating water. The brass front, or well, has a bail, and holds nearly one gallon of kerosene oil. It is just as safe as an ordinary lamp. You wouldn't be without it for twice its cost, after once having one of these stoves. Most oil-stoves emit an offensive odor, but this one doesn't. Its height is 27 feet, and weighs 20 pounds, or 30 pounds crated ready for shipment, either by freight or express.

Price, f.o.b. Chicago, \$6.00; or, combined with a year's subscription to the American Bee Journal—both for only \$6.50. FULL DIRECTIONS GO WITH EACH STOVE.

If you want something that is really serviceable, reliable, and thoroughly comfortable, you should get this "Barler Ideal" Oil Stove, as it can easily be carried by any woman from one room to another, and thus have all the heat you want right where you want it.

A HANDY TOOL-HOLDER!

Sent by Express, for \$1.50; or with the Bee Journal one year—both for \$2.00.

Every Manufacturer, Miller, Carpenter, Cabinet Maker, Machinist, Wheelwright and Quarryman, Farmer, or any one using a grindstone, should have one of these Tool-Holders. One boy can do the work of two persons, and grind much faster, easier and with perfect accuracy. Will hold any kind of tool, from the smallest chisel to a draw-shave or ax. Extra attachment for sharpening scythe blades included in the above price. The work is done without wetting the hands or soiling the clothes, as the water flows from the operator. It can be attached to any size stone for hand or steam power, is always ready for use, nothing to get out of order, and is absolutely worth 100 times its cost.

No farm is well-equipped unless it has a Tool-Holder. Pays for itself in a short time.

How to Use the Holder.

DIRECTIONS.—The Tool is fastened securely in the Holder by a set-screw and can be ground to any desired level by inserting the angle of the Holder into a higher or lower notch of the standard. While turning the crank with the right hand, the left rests on an steady the Holder; the Tool is moved to the right or left across the stone, or examined while grinding, as readily and in the same way as if held in the hands.

For grinding Round-Edge Tools, the holes in the standard are used instead of the notches.

We have a Large Stock on hand

A New Bee-Keeper's Song—

"Buckwheat Cakes and Honey"

Words by EUGENE SECOR.

Music by GEORGE W. YORK.

This song was written specially for the Buffalo convention, and was sung there. It is written for organ or piano, as have been all the songs written for bee-keepers. Every home should have a copy of it, as well as a copy of

"THE HUM OF THE BEES in the APPLE-TREE BLOOM"

Written by

EUGENE SECOR and DR. C. C. MILLER.

PRICES—Either song will be mailed for 10 cents (stamps or silver), or both for only 15 cents. Or, for \$1.00 *strictly in advance* payment of a year's subscription to the American Bee Journal, we will mail both of these songs free, if asked for.

Texas Bee-Keepers.

New Branch Office. We beg to announce the opening of a branch office and warehouse at Medina in less than one-half mile from the city. Rates of transportation from reach Southern Texas points.

Low Freight and Quick Delivery.

San Antonio as a Shipping-point.

To secure these two necessary advantages—low freight and quick delivery—and to be better prepared to serve the interests of our Texas friends, is our reason for establishing this new branch office. No other point in Southern Texas is better adapted to serve as a distributing point than San Antonio. It has four great railroads—the Southern Pacific R. R. east and West—the International and Great Northern R. R. from Laredo up through San Antonio and Central Texas, the San Antonio and Arkansas Pass R. R., and San Antonio and Gulf R. R. It also has the American, Wells-Fargo and Pacific Express Companies.

Our Managers.

We have secured as managers Mr. Udo Toepperwein, formerly of Leon Springs, and Mr. A. V. Walton, Jr., both of whom are well known to the bee-keepers of South and Central Texas. They are also thoroughly familiar with practical bee-keeping and all matters associated with it, and any orders sent to this branch will receive prompt, careful attention.

Our Goods.

As usual our motto is to furnish the best goods of the most approved pattern. We do not undertake to compete in price with all manufacturers. Bee-keepers have learned that it does not pay to buy cheap supplies, for a saving of 10 cents on the first cost of a hive may be a loss of many times this amount by getting poorly made and ill-fitting material. Every year brings us many proofs that our policy of "the best goods" is a correct one.

Our Catalog.

Very few changes in prices will be made in our new catalog, so do not delay your order, but send it at once. You will be allowed a refund if lower prices are made, and in case of higher prices ruling in the new catalog, if any, you will secure the benefit by ordering now. Catalog and estimates may be had by applying to the address given below.

Our Invitation.

Whenever you visit San Antonio you are invited to call at our office and make it your headquarters. Here you will find a display of Apianian Supplies not equaled elsewhere in Texas. You will also find on file the leading bee-journals to pass pleasantly your leisure time.

Spanish Catalog.

Some of you may read Spanish, or have a bee-keeping friend who does. If so, call for our Spanish catalog. It's sent free.

DR. A. B. MASON, Secretary, Toledo, Ohio.

EUGENE SECOR, General Manager and Treasurer, Forest City, Iowa.

MEMBERSHIP DUES, \$1.00 a year.

☞ If more convenient, Dues may be sent to the office of the American Bee Journal, when they will be forwarded to Mr. Secor, who will mail individual receipts.

A Celluloid Queen-Button is a very pretty thing for a bee-keeper or honey-seller to wear on his coat-lapel. It often serves to introduce the subject of honey, and frequently leads to a sale.

NOTE.—One reader writes: "I have every reason to believe that it would be a very good idea for every bee-keeper to wear one [of the buttons] as it will cause people to ask questions about the busy bee, and many a conversation thus started would wind up with the sale of more or less honey; at any rate it would give the bee-keeper a superior opportunity to enlighten many a person in regard to honey and bees."

The picture shown herewith is a reproduction of a motto queen-button that we are furnishing to bee-keepers. It has a pin on the underside to fasten it.

Price, by mail, 6 cents; two for 10 cents; or 6 for 25 cents. Send all orders to the office of the American Bee Journal.

BEST Extracted Honey For Sale

ALL IN 60 POUND TIN CANS.

Alfalfa Honey

This is the famous White Extracted Honey gathered in the great Alfalfa regions of the Central West. It is a splendid honey, and nearly everybody who cares to eat honey at all can't get enough of the Alfalfa extracted.

Basswood Honey

This is the well-known light-colored honey gathered from the rich, nectar-laden basswood blossoms. It has a stronger flavor than Alfalfa, and is preferred by those who like a distinct flavor in their honey.

Prices of Alfalfa or Basswood Honey:

A sample of either, by mail, 10 cents, to pay for package and postage. By freight—two or more 60-pound cans of Alfalfa, 7½ cents per pound. Basswood Honey, ½ cent more per pound than Alfalfa prices. Cash must accompany each order. You can order half of each kind of honey, if you so desire. The cans are two in a box, and freight is not prepaid.

Order the Above Honey and then Sell It.

We would suggest that those bee-keepers who did not produce enough honey for their home demand this year, just order some of the above, and sell it. And others, who want to earn some money, can get this honey and work up a demand for it almost anywhere.

GEORGE W. YORK & CO., 144 & 146 Erie St., Chicago, Ill.

The Novelty Pocket-Knife.

Your Name and Address on one side—Three Bees on the other side.

[THIS CUT IS THE FULL SIZE OF THE KNIFE.]

Your Name on the Knife.—When ordering, be sure to say just what name and address you wish put on the Knife.

The Novelty Knife is indeed a novelty. The novelty lies in the handle. It is made beautifully of indestructible celluloid, which is as transparent as glass. Underneath the celluloid, on one side of the handle is placed the name and residence of the subscriber, and on the other side pictures of a Queen, Drone, and Worker, as shown here.

The Material entering into this celebrated knife is of the very best quality; the blades are hand-forged out of the very finest English razor-steel, and we warrant every blade. The bolsters are made of German silver, and will never rust or corrode. The rivets are hardened German silver wire; the linings are plate brass; the back springs of Sheffield spring-steel, and the finish of the handle as described above. It will last a last-time, with proper usage.

Why Own the Novelty Knife? In case a good knife is lost, the chances are the owner will never recover it; but if the "Novelty" is lost, having name and address of owner, the finder will return it; otherwise to try to destroy the name and address, would destroy the knife. (If traveling, and you meet with a serious accident, and are so fortunate as to have one of the "Novelties," your Pocket-Knife will serve as an identifier; and in case of death, your relatives will at once be notified of the accident.)

How appropriate this knife is for a present! What more lasting memento could a mother give to a son, a wife to a husband, a sister to a brother, or a lady to a gentleman, the knife having the name of the recipient on one side?

The accompanying cut gives a faint idea, but cannot fully convey an exact representation of this beautiful knife, as the "Novelty" must be seen to be appreciated.

How to Get this Valuable Knife.—We send it post-paid for \$1.25, or give it as a Premium to the one sending us THREE NEW SUBSCRIBERS to the Bee Journal (with \$5.00). We will club the Novelty Knife and the Bee Journal for one year, both for \$1.50.

GEORGE W. YORK & CO.

St., Chicago, Ill.

☞ Please allow about two weeks for your knife order to be filled.

ESTABLISHED IN 1861 AMERICAN THE OLDEST BEE-PAPER IN AMERICA BEE JOURNAL

41st YEAR.

CHICAGO, ILL., DECEMBER 26, 1901.

No. 52.

* Editorial. *

The Annual Index will be found in this issue of the American Bee Journal. As many readers preserve every number, the index will be found a very valuable thing. In fact, if there were nothing else in this copy but the index, it would still be worth a good deal, as it shows the wide range of apian subjects treated in a single year.

Breeding from the Best has been the motto for so long a time, that when F. B. Simpson advocated in the Bee-Keepers' Review that a queen of very exceptional qualities being in the nature of a freak could not be relied upon to reproduce herself, therefore it was better to breed from a queen whose progeny were only a little above the average as to results, but showing greater constancy in her royal progeny—when Mr. Simpson advocated this doctrine, it seemed a little like the explosion of a bomb-shell. No one has proved that Mr. Simpson's position is wrong, and yet the fact remains that good results have been obtained—or at least seem to have been obtained—by following the old rule, to breed from the best.

Mr. Doolittle says in *Gleanings in Bee-Culture* that he has followed that rule for 30 years—breeding always from the queen that gave workers most valuable in bringing in nectar from the fields, rather than from those of the most uniform markings or purity, mentioning especially one remarkable freak from which he reared nearly all of his queens as long as she lived. Not only has his average yield per colony increased, but the uniformity of yield from his colonies has been constantly on the increase.

Comb Honey by the Case.—On another page, Mr. D. W. Working, the secretary of the "Colorado Bee-Keepers' Association, has a reply to both the recent article by R. A. Burnett & Co. and our editorial on the same subject.

We fail to see how Mr. Working can expect to convince any one that it is a fair way to sell honey at wholesale by the case—simply lump it off—instead of by weight. We wonder if he'd like to buy comb in that way by the box full may be box even full and shaken down, and may be not.

It is certainly more nearly fair to retail sections of honey by the piece than to wholesale it by the case (no weighing being done in either), for the consumer, if he thinks he

is not getting enough for his money, can have his grocer weigh it right before him. But the wholesaler has not that advantage when buying by the case at a distance.

Yes, sir; it was "quite fair" to use the \$400 illustration we did. The dealer in question was not guilty of any "smart dealing." But the people from whom he bought that particular car-load of honey simply cheated themselves out of \$400 by not selling their honey by weight instead of by the case. Surely, any one, if he desires to do so, can see the point in our illustration. The only fair way, as we see it, to all concerned, is to sell honey by weight, and not lump it off by the case. The wholesale buyer will sell by weight to the retail grocers, then why shouldn't he (the wholesale buyer) buy by weight?

What reasonable objection can there be to selling honey by weight? We know of none.

LATER.—One of our good Colorado subscribers seems to be quite upset over this matter, and, in fact, becomes somewhat personal and sarcastic in a private letter. He seems to think that we were the ones who made that \$400. Not at all. We never handled any honey by the case, except about a half car-load, and that was sold at the same price we paid for it—was sold before it was shipped, as we didn't care for it ourselves. We don't care to buy or sell honey by the case, as we don't think it is the correct method, with all due deference to our Colorado friends, and others who sell by the case.

We could give some more good illustrations on this subject, but think it unnecessary just now.

The Cost of Drones is considerable. Dr. Baehner estimates that 1000 drones consume a little more than 4 ounces daily. A Straw in *Gleanings in Bee-Culture* says:

"That means that the drones, reared in 25 square inches of comb will, in five weeks, consume about 9 pounds of honey."

But the Straw man estimates only a single generation of drones, whereas there may be two or more generations, although all the drones are not allowed to live five weeks. A considerable amount of honey should also be figured in that is used to feed the drone-brood.

Injury to Queens in the Mail is a subject of some discussion in *Gleanings in Bee-Culture*. Two of the somewhat numerous Miller family are not in entire accord as to the reason why it is that after a queen has been sent through the mail she will sometimes "go bad," although having been all right before being mailed. Arthur C. Miller

says the trouble is that the queen has suffered for want of proper nourishment. He says:

Remember that a queen in the full exercise of her functions is developing two and a half times her own weight of eggs every 24 hours. It is not the sudden taking of the queen from a place in which to deposit her eggs that injures (for she can and will continue to extrude them as they develop), but it is the lack of sufficient proper food to restore the drain on her system. If such food is not available in sufficient quantity, she starves, and on the duration of such starvation depends the extent of injury to her vitality. Knowing these things, and knowing that a queen free in her hive can ask and obtain food from thousands of bees, is it irrational to believe and assert that she must suffer when compelled to depend on *two* bees, only a few of which may be able to supply her needs? These statements may be readily verified by any one who cares to take the necessary pains.

Dr. C. C. Miller thinks that when a queen heavy with eggs is put in the mails, her great weight is such that she can not hold on to her place, and is injured by severe concussions. He suggests the advisability of caging a queen 24 hours before mailing, so that she will not be so heavy.

Whichever one is right, or even if both are right, might not the previous caging be a good thing? If the trouble comes from starvation, because the queen demands such a large quantity of food, certainly the caging ought to help, for after 24 hours cessation of laying she would not demand so much food.

Educating Tastes in Animals.—At the Chicago convention there was a decided difference of opinion as to the liking of stock for sweet clover, some saying that cattle would not eat it, and others saying they would eat it greedily. Both were no doubt correct, the fact being that there is more than is generally supposed in the matter of having the taste educated. With no thought of reference to sweet clover, A. I. Root, in *Gleanings in Bee-Culture*, tells about poultry having educated tastes, so that they greedily ate raw beans.

It is also said that Texas cattle that have never eaten corn will refuse to eat it at first. It is well known that cows in a state of nature are quite dainty in their tastes, yet the family bossy may be trained to eat almost anything, including dish-water. If sweet clover hay be fed dry, it will in many cases be accepted more readily than the green fodder, and perhaps in all cases a little persistence may succeed in having stock eat sweet clover either green or dry.

The Laws of Breeding. it is pretty safe to say, have never before had the attention they are having from bee-keepers and

queen-breeders to-day. At least, there never was as much said upon the subject as at the present time in the bee-papers. Doubtless much more would have been written and known on the subject if the mating of bees could be controlled as in the case of other animals. It is at least within the range of possibilities that control of fertilization may yet become an accomplished fact, and if it ever does come it will be well to be prepared for it in advance. Even if we never reach any greater control than at present, a thorough knowledge of all that can be learned about breeding may be turned to account. Especially let the younger members of the fraternity inform themselves as fully as possible. Doubtless more or less that is confusing, and sometimes contradictory, may be found in the bee-papers, but careful sifting may get that which will be useful in leading toward improvement of our present stock of bees.

Weekly Budget.

APIARY OF R. WHEELER.—On the first page of this number is the picture of the apiary of R. Wheeler, of Alameda Co., Calif. It is located in the corner of his chicken yard, showing all the hives but one. In the further right corner is a nucleus hive, containing four 3-frame nuclei, under the same roof, where he boards his spare queens. To the left will be seen a shade-roof made of shakes 3 feet long, nailed to strips of board 2x1, three in number. It hangs on a pivot one-third distance from the edge, as shown in the picture. By throwing forward it gives room to work at the hives, changes the shade, etc. In front of the hives is coal-sheds. Between the two pieces of old boiler-tubing is planted niggonette and primrose. The hydrant and hose are in the near right corner. All is enclosed by a wire fence 3 feet high. It is a very neat apiary.

BRITISH ESTIMATE OF AMERICANS. It is very pleasant to know that a very kindly feeling exists between this and the mother country, especially among bee-keepers. F. W. L. Shalen, a prominent British bee-keeper who is spending some months in this country, writes to the British Bee Journal:

I feel convinced that we have a great deal to learn from our American cousins. They are a progressive people, and are fast coming to the front in almost everything. The evidence of progress throughout the country, and especially in the cities, have simply amazed me. Many of the American bee-keepers' methods and appliances are unsuitable for adoption in England, on account of climatic and other differences, but there are others that ought certainly to be valuable to us, and it is to be hoped that our people will give them a fair trial, so that we may not lag behind the times.

MR. FRANK RAUCHFUSS, the energetic and wide-awake manager of the Colorado Honey-Producers' Association, was in Chicago a few days last week. He had been visiting various cities in the interest of his Association, which will doubtless result in mutual benefit. We had several good visits with Mr. Rauchfuss. So did Mr. Burnett, of R. A. Burnett & Co. Of course, the subject of selling comb honey by case as wrought was discussed quite thoroughly, and we think Mr. Rauchfuss returned feeling that there is more than one side to it.

The Buffalo Convention.

Report of the Proceedings of the Thirty-Second Annual Convention of the National Bee-Keepers' Association, held at Buffalo, New York, Sept. 10, 11 and 12, 1901.

(Continued from page 805.)

THIRD DAY—EVENING SESSION.

The meeting was held at Epworth Hotel, and was called to order at 5 p.m., by Mr. Watrous, president of the Pomo-logical Society, who announced that one of the papers set down for the afternoon session, and which had not been reached at that session, would be read then. After the reading of the paper, which was of no practical interest to bee-keepers, President Watrous said: "We have with us to-night the National Bee-Keepers' Association, and their officers. In conjunction with ours, have provided a series of discussions here which we shall next have, and without further preliminaries we will now listen to Prof. James Fletcher, of Ottawa, Ont., Canada."

Prof. Fletcher then delivered the following address on the subject of

Bees as Fertilizers of Flowers.

At the last annual meeting of the Ontario Bee-Keepers' Association, I had the pleasure of delivering an address on "The Value of Bees in Fruit Orchards," in which, among other subjects, I discussed the burning question of whether bees did or could injure the fruit-grower by attacking sound fruit on the trees. The position I took at that time was that unless fruit was first broken or injured, honey-bees could not gain access to the juice of the fruits. It appears to me now, however, that the ability of bees to puncture ripe fruit need not take up so much discussion at a bee-keepers' meeting as it has on some occasions been given to it.

If it is so very doubtful whether they can or cannot cause injury, it seems prima facie evident that even if this is possible which I do not believe—the injury occurs so seldom that it need not be considered. If it were a frequently occurring or important injury, some of those who have watched bees, either as friends or enemies, would have been able to settle the matter long before this.

Another subject taken up by me at the time referred to was, "Bees as Fertilizers of Flowers." and at the request of President Root, of the National Bee-Keepers' Association, I have prepared a short paper for this evening's meeting on that subject, in which I shall direct your attention to the striking interrelation of plants and insects, and in which I trust that I may be able to lay before you facts which may be new to some of your members, must be of interest to all, and cannot but call forth admiration for the marvelous provisions which are to be seen everywhere in Nature for the bringing about of good and useful results and prevent-

ing waste. It will be found that not only are flowers absolutely necessary to bees, as the source of their food—nectar and pollen—but that bees and other insects are no less necessary to most flowers, so that their perpetuation may be secured.

This fact should be recognized by the fruit-grower, above all others, for were it not for insects, and particularly for the honey-bee, his crops of fruit would be far less than they are every year, and even in some cases he would get no fruit at all.

Failure in the fruit crop is more often due, I think, to dull or damp weather at the time of blossoming, which prevents insects from working actively in the flowers, than to any other cause. Flowers of plants are a special development of leaf-growth, produced for a special purpose, namely, for securing the fertilization, development and maturing of the seeds, which are the chief means by which a species of plant is preserved from extinction. A normal flower consists of two sets of organs—a protective envelopment made up of the corolla, which as a rule has highly colored and showy petals; and the calyx, which is mainly a protection during the time the corolla and the more important organs contained within it are developing. The other set of organs, known as the essential organs, comprise the stamens and pistils: the former of these represent the male sex, and the latter the female. The anthers—the important part of the stamens—are practically small cases containing pollen, without the agency of which the ovules or undeveloped seeds which are formed in the lower part of the pistil cannot come to maturity, or—from the fruit-grower's point of view—unless the flowers on his trees are fertilized in this way, no fruit will form, and his labor will be in vain. It is necessary that pollen should be applied to the stigma or sensitive portion of the pistil before the seeds can be developed, and it has been found that it is most advantageous to a species that the seeds of a given flower shall be fertilized by the pollen from some other flower of the same species.

A study of the devices provided by Nature to insure this cross-fertilization forms one of the most charming branches of the whole study of botany. It is a branch of the subject which may be said to have had its origin in the remarkable investigations of the great naturalist, Charles Darwin, and has since been developed in Europe by Lubbock, Anton Kerner, and Miller. In this country excellent work has been done by Messrs. Halsted, Bailey, Robertson, Waugh, and others who are with us to-night; so that it will be seen that the study itself is quite recent, but,

now that attention has once been drawn to it, it can be recognized as a general principle running through all branches of the vegetable and animal kingdoms. Although, as was pointed out by Darwin, some plants can be and are fertilized by their own pollen, it is always of greater benefit to their descendants for flowers to be fertilized by pollen from other flowers of the same kind growing upon other plants. He summed up his observations with the trite observation, "Nature abhors perpetual self-fertilization," which was first enunciated in his great work published in 1862 on the fertilization of orchids. The publication of this classic work marks the beginning of one of the most important eras in the history of the science of botany. Since then endless observations have confirmed the accuracy of Darwin's law, and it has been found that in the vast majority of plants special appliances exist which will secure a more or less frequent inter-cross, and that in many these appliances completely exclude the possibility of self-fertilization.

The cross-fertilization of some plants is insured by the male and female organs occurring in separate flowers, either on the same or different plants. Familiar instances of male and female flowers on the same plant are the male catkins of such trees as the butternut, hickory, the birches, oaks and hazels. The female flowers are much less conspicuous but easily recognizable near the tip of the twigs. In the willows we find the male and the female catkins on separate trees, each tree bearing either staminate male flowers, or pistillate female ones. In many cases where the two sexes occur in the same flower, self-fertilizing is prevented by the male and female organs coming to maturity at different times, sufficiently far apart for it to be impossible for the pistil to be fertilized by the pollen borne on the same flower. In many cases there are remarkable contrivances which prevent the impregnation of flowers by their own pollen. In the species of primrose—and no better example can be found than the well known houseplant from the Himalayas—*Primula obconica*—it will be found that the flowers on different plants are dimorphic, some flowers having the tip of the pistil at the mouth of the tube and the anthers well down towards the bottom, while in other flowers this order is reversed, and the anthers are produced at the mouth of the tube and the pistil is so short that it does not reach half way up. Darwin proved by growing many plants from the seeds that by far better plants were obtained by the flower bearing long or short pistils being crossed with pollen from the other kind of flower. There are some flowers which are actually sterile to their own pollen, but can be fecundated readily with pollen from flowers growing on another plant of the same species. It has been pointed out by Prof. Waugh, of Vermont, that this is the case with the red American plums, and it is also the case with many varieties of apples and pears. This fact at once indicates the important bearing the presence of insects in an orchard at the time of blossoming has upon the production of an abundant fruit crop. Moreover, it can be shown that, owing to its size, weight and habits, no insect is so well calculated to insure the fertilization of

fruit-blossoms as the honey-bee, which plies rapidly from plant to plant, and by running over the flowers in search of pollen or nectar, brushes off the pollen and carries this vitalizing element on the hairs of its body to the next flower visited. The habit of the bees, which has frequently been noticed, of confining the visits when collecting largely to the same kind of plant, is taken advantage of by the bee-keeper to store up at certain seasons particular kinds of honey, such as apple, raspberry, basswood, clover and buckwheat honeys. This habit is also manifestly advantageous to the plants on account of the pollen which is carried by the bee being of the kind necessary for the fertilization of its flowers, which could not be effected if the pollen were that of some other kind of plant.

A few weeks ago I saw a striking instance confirmatory of this well-known fact. High upon the summit of Mount Che-am in the coast range of British Columbia, are magnificent mountain meadows, undulating plateaux, thickly covered during the month of August with the greatest profusion of brilliant flowers—wide stretches of golden arnica, crimson, green and white mountain heathers, beds of veratrum, valerian, lupines, large, white umbellifers, crimson cartilagineas, yellow adder's tongue, lilies, potentillas and waving grasses and sedges. This gigantic flower-bed, as might be expected, simply teemed with insect life. Butterflies sailed lightly from place to place; flies, beetles and small bees hurried and scurried in every direction, making the most of the short mountain summer, and the whole producing a picture of the greatest delight to the naturalist whose only, ever-present regret was that so few others could enjoy the enchanting scene.

Conspicuous on the purple spikes of the lupines were numerous, busy, grumbling, clumsy bumble-bees, crawling over the gray flowers, rifling them of their nectar, and filling their pollen-baskets with bright red pollen, which was most conspicuous on their black and white bodies, and strikingly different in color from the ordinary pollen collected elsewhere.

There are endless devices in flowers to secure the distribution of pollen at the time it will be of most use, and also for its protection from moisture after it had been emitted from the anthers. This is secured, in most instances, by the shape of the flowers, or the position of the floral leaves; again, the male and female organs of some flowers are very sensitive, the pollen being cast forth with some violence as soon as the stamens are touched by insects.

An instance of this is to be found in the common Canadian swamp-plant, called Lambkill or Swamp Laurel: the anthers are held down in small depressions round the edge of the corolla, and when an insect visits the flower, the stamens spring up, the anthers burst, and the pollen is thrown against the insect's body. The same thing may be observed in the common barberry flower.

In addition to the classes of plants already referred to, which are sterile to their own pollen (and in a few remarkable instances where the pollen is actually poisonous to the pistil of the same flower) there are numberless species which are partially sterile when

fertilized with their own pollen, and to a less degree when fertilized with pollen from close relatives, such as seedlings from the same parent as the plant bearing the flowers; and finally, in a large class where there is no apparent obstacle to self-fertilization, cross-fertilization often occurs from what is known as the prepotency of pollen from another individual over a plant's own pollen.

The agency by which pollen is transported from one flower to another is either animate or inanimate, and certain peculiarities will be found in flowers characteristic of each class. The inanimate agency with most flowers is the wind, and in these flowers the pollen is dusty and exceedingly light, so as to be carried on the lightest breeze; the flowers are inconspicuous and there is no nectar nor perfume. On the other hand, in those flowers which are dependent on an animate agency, which is mainly insects of various kinds, these insects must be attracted to the flowers; and we accordingly find that brilliant colors and far-reaching odors are developed.

These alone, however, would be of small gratification to the visitors; consequently, something more satisfying is provided, namely, nectar and pollen, which form the food of vast hordes of the insect world, and particularly of the honey-bee. Moreover, the remarkable provision is made that these attractions only appear just at the time when the visits of insects can be of a definite benefit to the plant; and further than this, an endless variety in the structure of the leaves, stem and flowers of plants makes easy the access of such species as will be of use, but retards or keeps out entirely those which would only regale themselves on the sweets provided without conferring any benefit in return. A pollen-grain is somewhat analogous to a seed: as soon as it reaches the stigma, the viscid portion of the pistil, a sort of growth begins, and delicate tubes are pushed out and run down through the tissues to the ovary. Through these tubes the vitalizing principle (the ovule) reaches and fecundates the ovules in the ovary. The period during which the pollen and the stigma are in a fit condition for fertilization is only of short duration. Those insects, therefore, which can fly quickly from plant to plant are much better adapted for this work than the slower moving, wingless, creeping insects which would be much more likely to have the pollen brushed from their bodies in their journey from plant to plant or even from flower to flower.

The size even of flying insects is also a matter of importance so that their bodies may come in contact with the anthers of one flower and the pistil of another, and most marvellous contrivances will be discovered when looked for in the blossoms of flowers, the effect of which is to exclude those visitors which are not profitable. Such are modifications in the shape and size of the corolla, the presence of tufts of hair, barbed spikes and bristles around the nectary, the secretion of the nectar at the bottom of long spurs or deep tubes of the corolla, etc. Wingless insects are kept from getting to the nectar by even more numerous constructions: reflexed bristles, copious hairs, viscid glands or viscid rings on the

stems, particularly around the flower-stalks. In some plants, as the fuller's teasel, the leaves join around the stem, forming a receptacle which catches rain and dew and forms an insuperable barrier. What is also doubtless a provision for the protection of the seeds of plants is the fact that when plants are eaten by animals or insects, it will frequently be noticed that the blossoms themselves are seldom destroyed. This may be due either to a more abundant production of thorns or bristles around these organs, or that they are rendered distasteful by certain compounds which are more abundantly secreted in the blossoms.

This fascinating branch of my subject is far too wide for me to more than refer to it now; but I am convinced that shape, position, nature and adornment of every part of a plant has some special significance if we can only discover it. That we have not yet perceived of what advantage these are, by no means justifies us in assuming that no advantage exists, and the search for the meaning of the innumerable shapes of flowers and leaves, their positions and behavior under varying circumstances provide a limitless source of pleasure and valuable instruction to whomsoever takes the matter up earnestly, verifying carefully each observation and exercising every care not to be carried away by the subject and jump to conclusions.

I have with me here to-day some excellent charts made by my friend, the Rev. Thomas Fyles, of Quebec, the president of the Entomological Society of Ontario. These will enable me to illustrate some of the points I have referred to, far better than I could otherwise have done. JAMES FLETCHER.

Some fine, colored charts were here exhibited, and much information was given about each in turn. Some of the points explained, were as follows:

NO. 1.—POLLEN-GRAINS.—Although so small, the minute pollen-grains are of various sizes and shapes, and have their surfaces beautifully ornamented in a variety of ways. In fact, these minute objects are just as characteristic and easily recognizable under the microscope as are the different kinds

of seeds. The pollens of several well-known plants were shown, as illustrative of the different shapes and markings of pollen-grains. The pollen of pine trees, which is very light, is produced in enormous quantities, and when carried on the wind and deposited at a distance, has sometimes been taken for showers of powdered sulphur. An instance of this was brought to his notice during the past summer at Armstrong, in British Columbia. A remarkable occurrence illustrating the extreme likeness of the pollen-grains of pine trees was one of these so-called sulphur showers on the deck of a ship nearly 200 miles from land. The doctor of the ship, who happened to be a botanist, detected the true nature of the yellow deposit by putting some of the material under his microscope.

NO. 2.—MOUTH-PART OF THE HONEY-BEE. the bumble-bee and the wasp.—The differences in the mandibles of these insects were pointed out and explained. The mandibles of the honey-bee are provided for the working of wax, and this only when softened at a high temperature. Those of the wasp for gnawing wood for the manufacture of the paper with which their nests are surrounded.

NO. 3.—FLOWERS OF THE PEA FAMILY.—These were illustrated by figures of the Broad bean, showing the distinct contrast of black and white, the Sweet pea and the Broom. The different structures were explained in their bearing on the question of cross-fertilization, attention being drawn to the brush-like stigma and the elastic keel.

NO. 4.—A FLOWER OF THE SUN-FLOWER FAMILY.—The many points of interest in these flowers, and the devices by which they are prevented from becoming self-fertilized, were explained.

NO. 5.—FLOWERS OF THE COMMON PRIMROSE. referred to above, showing the two forms with long and short pistils.

NO. 6.—FLOWER OF TROPEOLUM.—Attention was drawn to the markings and tufts of hair in the throat of the garden flower known as the Nasturtium, which acted as path-finders to insects of a proper size and shape, so as to secure fertilization to the seeds

when they visited the flowers for the sake of the copious nectar in the long hours.

NO. 7.—FLOWERS OF ANTIRRHINUM.—The necessity of a large, strong insect, such as a bee, to open the Snap-Drum flower and reach the nectar was evident, but it was stated that sometimes bumble-bees gnawed a more direct entrance to the nectar at the base of the flower. After this entrance was once made, honey-bees might be seen filling the flowers through this hole instead of entering by the proper opening. This Mr. Fletcher believed was an analogous case to honey-bees sucking the juice from injured fruits.

NO. 8.—THE NIGHT-FLOWERING CATCHFLY.—The blossoms of the Pink family are extremely interesting. There are 10 stamens. The flowers open after sun-down, when they are white and conspicuous. Sweet perfume is emitted, and during the first evening of the three in which each flower expands, five of the anthers are pushed out of the flower-tube and shed their pollen, after which they dry up and fall away. The next morning the petals curl up and present the appearance of a faded flower. During the day there is no perfume, but in the evening the petals again unfold, the scent returns, and the other five anthers appear. It is not until the third evening, when all the pollen is exhausted, that the pistil lengthens out and exposes itself to receive pollen from other flowers.

Several other charts of a similar nature to the above were shown, and their bearing on the subject explained. In bringing his remarks to a close, Dr. Fletcher spoke of the great value to all classes of workers of the introduction of "Nature Study" into our schools and universities. He spoke highly of the work which had been done by Profs. Bailey and Craig of Cornell University. He knew of nothing so valuable in education as inculcating a knowledge, and with it a desire for knowledge, concerning all the common objects which surround us on every side, an ignorance of which in most classes of the community was such a conspicuous characteristic.

Contributed Articles.

Selling Comb Honey by the Case.

BY D. W. WORKING.

ACTING on the suggestion of the Editor of the American Bee Journal, I read before the Colorado State Beekeepers' Association a proof of the article by R. A. Burnett & Co., published on page 759. This article, which seems to have been written especially for the enlightenment of Colorado beekeepers, was discussed at some length by our members; and I venture to offer an abstract of their remarks.

Mr. Frank Ranchfuss, manager of the Colorado Honey-Producers' Association, said:

"I plead guilty to writing one of the letters quoted in that article. If we guarantee a weight for separated, half-separated, and unseparated honey, is it not virtually the same thing as selling by weight? In one of Burnett & Co.'s letters to us, they said they were not willing to buy an unknown quantity. I wrote back that they were buying a known

quantity. In one instance the buyers got 200 pounds more than they were figuring on. It is an injury and an imposition to make the statements in that article without stating the whole thing. A house of that standing should know something of the difference between separated and unseparated honey. They want to buy light weight honey by the pound, and as soon as concessions are reached they will throw out the heavy-weight honey. It has worked that way, and it will work that way again."

R. C. Aikin—I think our system is perfectly fair. It guards against wrong-doing on both sides.

H. C. Morhouse—I fully endorse those remarks. The article misrepresents the position of our people.

T. Lytle—When the buyer asks for quotations by the case, he makes a bid on the guaranteed weight. He is not injured or abused in any manner.

Mr. Aikin—Selling by the case makes it an easier matter to do business. We have rules to sell by.

Mr. Ranchfuss—None of the grading rules but ours have considered the question of weight. We have a standard section, which they do not have in other States. Having a standard section, we can have a standard of weight. How can you adopt a set of rules, with a standard section, without taking weight into consideration? I can show quantities of honey in our store now, graded as No. 2 under our rules, which will be sold as No. 1 in Eastern markets. Selling by

the case overcomes hair-splitting differences in tare. If a lot of separated honey, for example, does not net 21 pounds, we throw in a few cases extra; if they net heavier than that weight, we do not charge the buyer for the surplus. If the same conditions existed in Eastern markets, it would be more satisfactory to the general trade.

Mr. Aikin—I have a suspicion that the writer of that article has been bitten by some one with grading rules not so good as ours.

W. Z. Hutchinson—If Burnett & Co. knew that you had such rules, that article is not fair.

Mr. Aikin—If we sell by weight, then they will insist that we sell them light-weight honey, and they will sell by the case.

J. B. Dodds—And if you go to Chicago with the light-weight honey then they will want heavy-weight honey. We often put in heavy-weight honey. We often put in heavier weight in packing than we would if it were not for those rules.

Mr. Rauchfuss—When honey is sold by weight only, no distinction is made between separated and unseparated honey. But by our rules we admit that half-separated and unseparated honey are less desirable than separated, which is easier to lift out without damage, by the grocer. By our system, there is more uniformity of weights. We guarantee weights, and give a man every pound he buys.

The attentive reader will have noticed that the foregoing discussion is a defense of the Colorado system rather than a criticism of the article by Burnett & Co. This is natural. Our people are familiar with the merits of their own methods; they could not be perfectly sure of the merits of the arguments favoring another system by a single hearing of such an article as that read to them.

Burnett & Co. could not well be ignorant of the Colorado grading rules. These rules have been published in the American Bee Journal. A copy has been furnished to Burnett & Co.; and it was unjust to suppose that they are too stupid to understand them. In spite of the knowledge which they must have had to the contrary, they beg the whole question by referring to the "pig in the bag." Let me quote the Colorado rule for No. 1 honey:

No. 1—Sections to be well filled and capped, honey white, slightly amber, comb white and not projecting beyond the wood, wood to be well cleaned; cases of separated honey to AVERAGE 21 pounds net per case of 24 sections, with a minimum weight of not less than 20 pounds for single case; cases of half-separated honey to AVERAGE not less than 21 $\frac{1}{2}$ pounds net per case of 24 sections, with a minimum weight of 20 $\frac{1}{2}$ pounds for single case; cases of unseparated honey to AVERAGE not less than 22 $\frac{1}{2}$ pounds net per case of 24 sections, with a minimum weight of 21 $\frac{1}{2}$ pounds for any single case.

Will any intelligent reader of the American Bee Journal believe that the man who buys honey guaranteed to be packed according to that rule is buying a pig in a bag? Indeed, will not the reader know that the buyer, whether of one case or a car-load of cases, is sure to get at least a certain, definite amount of honey?

The argument in which the "bag of tea, coffee or sugar" figures, does not lack ingenuity. But why did not this wise logician include also the bag of flour? Does it weigh exactly a hundred pounds? Not at all. And yet flour is quoted by the hundred-weight. We buy a great variety of articles by the package. And the grocer who sells a section of honey as a pound is probably giving as much weight for the money as he does when he sells certain other "pound" packages. People who buy honey by the section can easily be made to understand that sections are very likely to vary in weight. Can it be that any one is so lacking in discernment as to suppose that every section (pound section, if you please) would be equal in weight to every other section?

Perhaps I am incensurably ignorant; but I must confess that I do not know of a single association of bee-keepers that is "advocating the abandoning of weighing their honey." I am sure our rules make it necessary to have the scales pretty close by when packing comb honey—as the readers can not but know, having read the rule quoted above.

A word as to the editorial in the American Bee Journal. Is it quite fair to use the example of a car of honey which cleared the buyers \$400 "beyond a fair profit" as an excuse for intimating that the producer was not dealing squarely? That dealer might be accused of "smart dealing." The producer doubtless knew what he was selling, and was satisfied with the price. If I am not blind to its meaning, the editorial illustration was simply logged in to furnish excuse for giving honey-producers a lot of goody-goody advice, while, if it really showed anything, it illustrated the readiness of the wholesale dealer to take the advantage of the producer.

— I am not speaking for the rules of any other association;

but I am sure the rules of the Colorado State Association can not be fairly interpreted to the hurt of the buyer. He is sure to receive no less than a very definite minimum weight. If he gets more, no one will complain. Of course, there are individual bee-keepers who can not or will not grade honestly. I am not defending them.

Arapahoe Co., Colo.

Apiary Inspection in the State of Michigan.

To the Honorable Dairy and Food Commissioner:

SIR:—I herewith submit my report for the work done during the months of July, August, September and October as State Inspector of Apiaries. I have visited in all 206 apiaries, having in them a total of 3,286 colonies. I have found 402 diseased colonies, making a total of 12.1 percent of those inspected. I have found the disease present in 119 apiaries, which is 57.7 percent of the whole number inspected. It will be noticed that the majority of the yards that contained the disease have in them only a few, and many times only one colony. It is impossible to tell exactly how many of the diseased colonies have been destroyed by the owner. Perhaps 50 percent of those condemned. I have been compelled to burn only one colony against the will of the owner. These apiaries were scattered through the counties of St. Joseph, Hillsdale, Lenawee, Washtenaw, Jackson, Calhoun, Barry, Eaton, Ingham, Livingston, Oakland, Macomb, St. Clair, Lapeer, Genesee, Shiawassee, Clinton, Ionia, Muskegon, Montcalm, Wexford, Benzie, Kalkaska and Antrim.

I have found the disease more prevalent in the older sections of country, that is, there is more disease in southern and central Michigan than in the northern part of the State. In the north it is confined to localities and is not of very long standing. In almost every case it can be traced back to the bringing in of diseased bees or fixtures from the south. In the southern part, however, the disease is scattered promiscuously and breaks out in yards, infecting many colonies, without any source of contamination.

I have found many bee-keepers who are perfectly ignorant of the disease, and even when it is present in their yards and a large proportion of their bees are diseased, they fail to see that anything serious is wrong. These bee-keepers, of course, belong to the class who keep a few bees as a side-issue and are not posted in modern apiculture. Then, again, I have found the disease present in the apiaries of specialists in bee-culture, who are unfortunate enough to be located in the same vicinity with one of these bee-keepers who are not posted. The uninformed man will not listen to the advice and pleadings of the specialists, but will leave diseased colonies to die, and be robbed out by the bees from the larger yard, in this way working ruin on the helpless specialist, who cannot control the action of his ignorant neighbor. Then, oftentimes, when this specialist resorts to the protection of the law to compel his neighbor to clean up the diseased yard, he is looked upon by the people of his vicinity with utmost contempt.

The most active agents in spreading the disease are, first, that of robbing out colonies which have become weak and run down; and, second, that of using old hives in which the bees have died from the disease.

A grave difficulty arises when treating the bees to overcome foul brood, in that it is a very hard matter to impress upon the uneducated man the necessity of careful work, and the nature of bacteria. He will neglect some small but important matter, or fail to take some necessary precaution in order to insure success. As a consequence, the treatment is frequently a failure. This is not always the case, however; many apiarists are eager to learn all that is to be known about the disease, and by careful, persistent work have stamped it out of their yards. The treatment used by many apiarists has been to kill the infected colony with sulphur, remove the hive to the cellar, and cut out and save for home use all good honey, scrape clean and disinfect the hive, finally burning all refuse, scrapings and inside furniture. This method of treatment entails much less work than attempting to cure the colony, and the honey and also the hive is saved.

The needs are great, and many localities where the disease is known to exist have not been visited at all. Many of the localities visited this summer must be covered again at the beginning of next season to insure the effectual stamping out of the disease. I have met with the most hearty co-operation on the part of the intelligent apiarists of the State. They have not only manifested an interest in the work, but in many cases have materially assisted in the eradication of the disease in their locality. Respectfully submitted,

JOHN M. RANKIN.

Report for 1901—Sweet Clover and Alfalfa.

BY WM. STOLLEY.

Like most of the readers of the American Bee Journal, I also will make my annual report, as usual.

Although drought-stricken as was the entire West, the past season, the great value of sweet clover and alfalfa as forage-plants and nectar-yielders is again clearly proven, by the crops of hay and honey I harvested.

Regarding the product of my apiary, my report is as follows:

From 21 colonies run for extracted honey, I got 3105 pounds, or an average of about 148 pounds per colony. From 5 colonies in New Heddon hives run for comb honey, I got 380 well-filled and perfectly capped sections, or an average of 76 sections per colony, and, besides, 60 pounds of extracted honey. I thus got a total of 3545 pounds of surplus honey from 26 colonies of bees, spring count, and plenty for the bees to winter on besides.

I had but 5 swarms, all told. My best colony run for extracted honey gave me 193 pounds of surplus, and my best colony run for comb honey gave me 136 sections and 12 pounds of extracted. I got 46 pounds of bright yellow wax from cappings, and reared 19 extra-line queens from my choicest colonies for my own use; and increased, by the nucleus plan, from 26 to 36 colonies. Ever since October 18, my bees have been packed for winter, and had a general flight to-day (Nov. 12). But I sustained quite a loss, in the past season's surplus, on account of the purchase of 5 queens in the late summer of 1900. The queens I got were reputed as of extraordinary value, and a remarkably superior strain. When these queens arrived, they proved to be undersized; but that did not scare me, because I have seen many a small queen which was much the superior of larger queens.

But when one of those queens proved herself to be a most miserable hybrid, my confidence in this extra "superior strain" was greatly shaken, and with considerable apprehension as to the value and worth of the other four, I waited results after wintering them.

The hybrid queen was replaced by another queen, and was introduced as late as October 12, 1900. In the spring following, three queens of that "superior strain" of bees proved to be practically worthless, and very poor layers, while one of them averaged as medium-good. Only the one I received in October, to take the place of the little black hybrid, proved to be a really fine queen, and her colony is one of the very best in my apiary now.

Two of the queens, which I bought as superior stock, I killed in early summer, and united their colonies with the colony of the queen that was lacking, to give her a trial in the season.

The united three colonies of this "superior strain" did not average in strength with any of my ordinary colonies, after forming but one colony. The united colonies, if their queen had been all right, would have given me about 450 pounds of surplus extracted honey for the season that I removed good queens to make room for the "superior stock"; while the three united colonies of this "superior strain" have actually given me only 43 pounds surplus! Hence, I actually lost about 400 pounds of honey, in consequence of the inferiority of these 3 queens—a loss of \$60, since I sell my honey at 5 cents per pound.

I have but a small apiary, but I aim to have a superior queen in every hive, and if any one of them is lacking, she has to make room for something that grades well.

Some 18 or 19 years ago a Rev. Mr. Briggs, of Iowa, (if I remember the location rightly) made, in substance, the following proposition in the American Bee Journal, to breeders of queens generally:

1. (Rev. Briggs) will pay \$100 for the best queen sent me by any queen-bee breeder, upon the following conditions, to-wit:

1.—All queens entrusted to me by any party, will receive at my hands, the very best of care and attention, and an accurate record of her work will be kept.

2.—At a certain date (stated) a disinterested committee (here the widely known parties comprising that committee were named) will be the judges in the contest, and the party whose queen is declared to be the premium queen will get the \$100, but the queen thus awarded becomes my (Rev. Briggs') property.

3.—I (Rev. Briggs) also reserve the right, while making this offer, to retain any and all the queens sent me, upon the payment of \$2 for each queen retained by me, and I will return all queens not wanted by me, free of charge, if so desired by the party or parties sending me queens.

Now, I do not remember the name of the party whose queen won the \$100, but I ordered one of the queens reared in the subsequent year from the \$100 queen by Rev. Briggs and paid \$5 for that queen, and it was the cheapest and best queen I ever bought.

Fifteen of the 36 queens now in my apiary are "Briggs queens," and they are in the dead as mothers of honey-producers.

I have other valuable strains of bees, obtained from other dealers in queen-bees, but the "Briggs strain" proves, best of all of them, that "blood will tell."

Now, Mr. Editor, I wish that another Rev. Briggs, as honest and reliable as was the one I have mentioned above, would work a similar scheme, and I, for one, will cheerfully pay \$5 for one of the offspring of such queens reared "in a natural way"; but I want the bees to rear the queens under the most favorable conditions; and I want them to build their own queen-cells from bottom to tip, too. No stick-made queen-cups for any queens that I wish to introduce into any colony in my apiary!

I read with great interest the proceedings of the meeting at Buffalo, and always "reach out at once" for the "Old Reliable" when it comes. Hall Co., Neb.

* The Afterthought. *

The "Old Reliable" seen through New and Unreliable Glasses.
By E. E. HASTY, Sta. B Rural, Toledo, O.

TIME OF QUEEN EMERGENCE.

Yes, sir, Mr. Miller, if it's true with regularity, or anything like regularity, that queens emerge in full colonies in 15 days, and only in nuclei or other depressing circumstances take 16 days, then that venerable (not sweet) 16 must come out of the books. But first let us hear from Maine, and Oregon, and Texas, and other places—honey-flow and dearth—early, mid-season, and late. Locality, crop conditions and season are normal things; but nuclei are abnormal things which should not rule. Page 685.

SWARMS AND FULL SHEETS OF COMB FOUNDATION.

Sounds reasonable that a swarm might consider sheets of foundation simply as partitions, and object to so many ridiculously narrow rooms. But a good many swarms have been successfully hived on full sheets, I take it. Page 686.

SIX HONEY CROPS IN TWELVE.

Six paying crops in twelve years, as an actual experience, rather takes us down in our estimate of bee-keeping in the irrigation regions. And it seems that we can hardly expect as good as six out of twelve unless there is something else besides alfalfa to prop up with. Page 685.

THAT UNFORTUNATE GLUCOSE-FEEDING.

Once more I will refer you to that ton of glucose on pages 579, 681 and 707. I supposed that it marked another milestone on a road that we would prefer fenced up—or rather never graded out. It used to be the case that pure glucose would only be taken when bees were in a state of semi-starvation, and that they would stop taking it as soon as they had a rather small supply—never building comb and storing surplus with it. When I read of so large an amount as a ton I feared that improvements of the article had changed some if not all of this. Glad if we don't have to believe so just yet. I must cry for mercy as to the dull way I read the editorial. The time of year forbids the idea of fraudulent surplus. We do not know that he succeeded in feeding it all. And to work off what he did feed he may have mixed it with something better.

STARVATION FOR BLACK BROOD.

That was a wise remark of McEoy's on the black-brood question, page 710. Imprisoning bees off the combs for four days without feeding uses up the infected honey all right—so far, well; but it also gets the bees themselves into such a lean and inactive condition as they must not be in if they are to combat disease to advantage; and it takes days to get them out of that condition. So it is in doubt whether that particular manipulation does more good than harm, or more harm than good.

OUR NEW CATALOG, describing and listing the **FINEST LINE OF BEE-KEEPERS' SUPPLIES IN THE WORLD**, will be ready about the first of the year. If you have not been receiving a copy annually, send us your name and address, and one will be mailed you free. Prices will be same as last season with the exception of the narrow, plain sections with no bee ways, which will be 25 cents per thousand less.

G. B. LEWIS COMPANY, Watertown, Wis., U. S. A.

Special Agency, C. M. Scott & Co., 104 East Washington Street, Indianapolis, Ind.

Excellent shipping facilities and very low freight rates for Southern and Eastern territories.

A HANDY TOOL-HOLDER!

Sent by Express, for \$1.50; or with the Bee Journal one year—both for \$2.00.

Every Manufacturer, Miller, Carpenter, Cabinet Maker, Machinist, Wheelwright and Quarryman, Farmer, or any one using a grindstone, should have one of these Tool-Holders. One boy can do the work of two persons, and grind much faster, easier and with perfect accuracy. Will hold any kind of tool from the smallest chisel to a draw shave or ax. Extra attachment for sharpening scythe blades included in the above price. The work is done without wetting the hands or soiling the clothes, as the water flows from the operator. It can be attached to any size stone for hand or steam power, is always ready to use, nothing to get out of order, and is absolutely worth 100 times its cost.

No farm is well-equipped unless it has a Tool-Holder. Pays for itself in a short time.

How to Use the Holder.

DIRECTIONS.—The Tool is fastened securely in the Holder by a set-screw and can be ground to any desired level by inserting the arm of the Holder into a higher or lower notch of the standard. While turning the crank with the right hand, the left rests on an studies the holder; the Tool is moved to the right or left across the stone, or examined while grinding, as readily and in the same way as if held in the hands.

For grinding Round-Edge Tools, the holes in the standard are used instead of the catches.

The "Barber Ideal" OIL-HEATER ...

Saves Its Cost Every Year!
NO ODOR! NO SMOKE! NO ASHES!

Costs only a cent an hour to run.

The editor of the American Bee Journal is using the "Barber Ideal" Oil Heater, and it is all right in every way. We liked it so well that we wanted our readers to have it too, so we have recently arranged with its manufacturers to fill our orders. The picture shown herewith is the one we recommend for general use. It is a perfect specimen of a stove for heating dining-rooms, parlors, and bedrooms. It hinges back in a substantial way, and is thoroughly well made throughout. The urn removes for heating water. The brass front, or well, has a bail, and holds nearly one gallon of kerosene oil. It is just as safe as an ordinary lamp. You wouldn't be without it for twice its cost, after once having one of these stoves. Most oil-stoves emit an offensive odor, but this one doesn't. Its height is 21 feet, and weighs 20 pounds, or 30 pounds, rated ready for shipment, either by price or express.

Price, f.o.b. Chicago, \$6.00; or, combined with a year's subscription to the American Bee Journal—both for only \$6.50. FULL DIRECTIONS GO WITH EACH STOVE.

If you want something that is really serviceable, reliable, and thoroughly comfortable, you should get this "Barber Ideal" Oil Stove, as it can easily be carried by any woman from one room to another, and thus have all the heat you want right where you want it.

Address,

GEORGE W. YORK & CO.,
Chicago, Ill.

No. 4 "Barber Ideal" Oil-Heater.

CONVENTION NOTICES.

Wisconsin—The Wisconsin State Bee-Keepers' Association will hold its annual convention in the State Capitol at Madison, Feb. 5 and 6, 1902. This promises to be a large convention. All are invited to attend. There will be excursion rates of 1 fare for the round-trip, good for all of the first week in February.
N. E. FRANCE, Pres. ADA L. PICKARD, Sec.

Michigan—The Michigan State Bee-Keepers' Association will meet in convention at Petoskey, Jan. 1 and 2, 1902. This promises to be the most largely attended meeting of the Association in years. You are invited to attend. Reduced rates on all railroads tickets can be bought Dec. 30 and Jan. 1 good to return not later than Jan. 4. There will be no set program, but another of our "open congress" meetings. Those who have attended in the past know what that means, and those that don't should come and find out. A novel design for badge has been ordered in honor of Petoskey.
Geo. E. HILTON, Pres.

California—The California State Bee-Keepers' Association will hold its annual convention in the Chamber of Commerce, Los Angeles, Jan. 15 and 16, 1902. We will try to have a good program. Come and exchange your bright ideas with your neighbors, and get some of the moss rubbed off your back. J. F. McINTYRE, Sec.
G. S. STEPHENS, Pres.

1901—Bee-Keepers' Supplies!

We can furnish you with The A. I. Root Co.'s goods at wholesale or retail at their prices. We can save you freight, and ship promptly. Marked price paid for beeswax. Send for our 1901 catalog. M. H. HUNT & SONS, Bell Branch, Wayne Co., Mich.

We mail it for 25 cents; or will send it FREE as a premium for sending us ONE NEW subscriber to the Bee Journal for a year at \$1.00; or for \$1.00 we will mail the Bee Journal one year and the Clipping Device. Address,

GEORGE W. YORK & COMPANY,
Chicago, Ill.

Langstroth on... The Honey-Bee

Revised by Dadant—1900 Edition.

This is one of the standard books on bee-culture, and ought to be in the library of every bee-keeper. It is bound substantially in cloth, and contains over 500 pages, being revised by those large, practical bee-keepers, so well-known to all the readers of the American Bee Journal—Chas. Dadant & Son. Each subject is clearly and thoroughly ex-

plained, so that by following the instructions of this book one cannot fail to be wonderfully helped on the way to success with bees.

The book we mail for \$1.25, or club it with the American Bee Journal for one year—both for \$1.75; or, we will mail it as a premium for sending us THREE NEW subscribers to the Bee Journal for one year, with \$3.00.

This is a splendid chance to get a grand bee-book for a very little money or work.

GEORGE W. YORK & CO.

A New Bee-Keeper's Song—

"Buckwheat Cakes and Honey"

Words by EUGENE SECOR.

Music by GEORGE W. YORK.

This song was written specially for the Buffalo convention, and was sung there. It is written for organ or piano, as have been all the songs written for bee-keepers. Every home should have a copy of it, as well as a copy of

"THE HUM OF THE BEES in the APPLE-TREE BLOOM"

Written by

EUGENE SECOR and DR. C. C. MILLER.

PRICES—Either song will be mailed for 10 cents (stamps or silver), or both for only 15 cents. Or, for \$1.00 strictly in advance payment of a year's subscription to the American Bee Journal, we will mail both of these songs free, if asked for.

GEORGE W. YORK & CO.

144 & 146 Erie St., CHICAGO, ILL.

REVERSIBLE WALL MAP —OF THE— UNITED STATES AND WORLD,

WITH SPECIAL INSET MAPS OF

Ghina, Cuba, Porto Rico, The Philippines, Hawaii, and Alaska,

Especially prepared to meet the demand for a first-class map that will give a quick, general idea of location of events the world over, and particularly to the United States and our territorial possessions. **Very useful in every Home and Office.**

66 x 46 INCHES IN SIZE.

ELEVEN BEAUTIFUL COLORS.

Best and Most Necessary Map
Ever Issued.

No Home or Business House
should be without it.

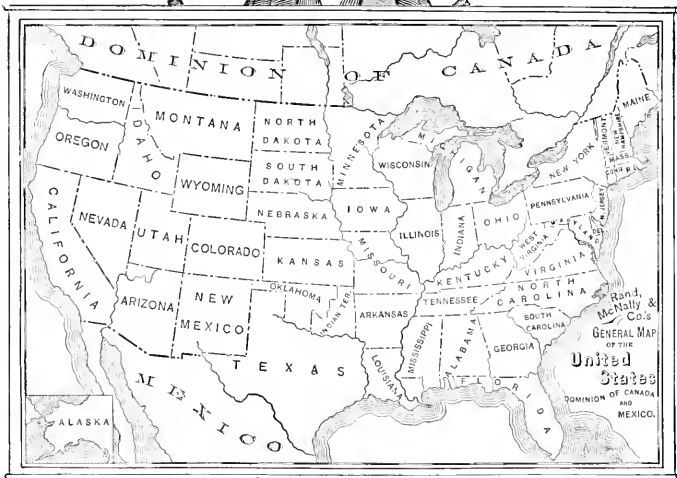

The **xx** Plates

are works of art. The engraving is plain, bold, and decisive. The color work is elegantly contrasted, but not gaudy.

Perfection and Artistic Elegance

a salient feature of this map not approached by any similar publication.

A **xxx** Marginal Index

is one of the invaluable features.

It gives an alphabetical list of countries, their location on map, style of government, population, a r e a , products, minerals, imports, exports, etc.

It has been pronounced a **xxx**
Photograph of the World

The 1900 Census **xx**
of the largest American Cities is given.

One side shows a grand map of our great country, with **counties**, railroads, towns, rivers, etc., correctly located. The other side shows an equally good map of the world. Statistics on the population, cities, capitals, rivers, mountains, products, business, etc., a veritable photograph of the UNITED STATES AND WORLD.

The map is printed on heavy map paper and is mounted on sticks ready to hang. Edges are bound with tape.

1901 EDITION.—Every reader should consult it every day. The plates show all the new railroad lines and extensions, county changes, etc. Especial attention is given to the topography of the country; all the principal rivers and lakes, mountain ranges and peaks are plainly indicated. The leading cities and towns are shown, special attention being given to those along lines of railroads. The Canadian section of the map gives the provinces of Ontario, Manitoba, and British Columbia, with nearly all of Quebec and New Brunswick, the county divisions being clearly marked. The Southern portion of the map includes the Northern States of the Republic of Mexico, and the Bahama Islands.

On the reverse side is the Library Map of the World. The largest and most accurate map on Mercator's Projection ever produced. The political divisions are correctly defined and beautifully outlined in colors. The ocean currents are clearly shown and named. Ocean steamship lines with distances between important ports are given. A marginal index of letters and figures enables one easily to locate every country in the world. A series of short articles in alphabetical order is printed around the border of this map in large, clear type, containing valuable information concerning agricultural, mining, and manufacturing statistics, also the value of imports and exports in dollars. The area, population, form of government, and chief executive of every country in the world is given up to date, also the names of the capitals and their population. **The Inset Maps** are elegantly engraved and printed in colors. They are placed in convenient positions around the United States map, and will be invaluable to every person desiring a plain understanding of our possessions. An inset map of China on the World side of map adds to its value.

Two maps on one sheet, all for only \$1.50, sent by mail or prepaid express; or we will forward it free as a premium for sending as **Three New Subscribers** at \$1.00 each; or for \$2.00 we will send the Map and the American Bee Journal for one year. Address,

GEORGE W YORK & CO.,

144 & 146 Erie Street, CHICAGO, ILL.

THE CHRISTMAS LADIES' HOME JOURNAL is the largest number of that popular magazine ever issued, and the quality seems in keeping with the quantity. It opens with an account of "The People Who Help Santa Claus," after which comes a sweet story by Elizabeth McCracken, entitled, "The Baby Behind the Curtain." John Fox, Jr., the clever Keutknicht, contributes a short story, and the Journal's new serial of the Western metropolis, "The Russells in Chicago," is begun. Rudyard Kipling tells us minutely "How the First Lady Was Written," and Elliott Flower has a laughable sketch, "The Linfield's Christmas Dinner." The Journal's two romances, "Christine" and "A Gentleman of the Blue Grass," are given their second and third installments respectively, and the library of the "Bradley House" is shown. Mr. Bok's editorial takes the form of a personal and somewhat confidential chat with his readers. There are also a children's Christmas play by Ednah Proctor Clarke, some touching stories of "The Other Side of the Town," by the Rev. David M. Steele, and an interesting account of the Sistine Madonna done in needlework. The various departments are unusually strong, and the whole magazine is full of Christmas spirit. A noteworthy feature, pictorially, is the double page of college girls, on which are shown groups of college girls from nearly every girls' school of note in the country. This is only the first in a "picture story" of one hundred photographs, which will show "What a Girl Does at College." The cover design is a beautiful piece of work by Thomas Mitchell Pierce. By The Curtis Publishing Company, Philadelphia. One dollar a year, ten cents a copy.

To make cows pay, use Sharps from Separators. Book "Business Dairying" & Cat-212 free. W. Chester Pa.

Change of Chicago Passenger Station.

Beginning December 29, all passenger trains of the Nickel Plate Road will arrive and depart from Grand Central Station, 5th Ave. and Harrison St., Chicago, instead of Van Buren St. Station, as formerly. 49-52A1

HONEY AND BEESWAX

MARKET QUOTATIONS.

CHICAGO, Dec. 19.—The honey market is of a slow nature, with little change in price of any of the grades. At this season of the year many of the retailers have laid in a supply sufficient to carry them over the holidays. The grades of white comb honey, 14 @15c; good to No. 1, 13½@14c; light amber, 12½@13c; dark grades, including buckwheat, 10@12c. Extracted, white, 8½@9c; amber, 7½@8c; dark, 6½@7c. The scale of prices varies according to flavor, body and package. Beeswax steady at 24c.

R. A. BURNETT & CO.

NEW YORK, Dec. 19.—Comb honey continues to be in good demand, and while the market is not overstocked, arrivals of white honey are sufficiently large to meet the demand, while buckwheat is rather scarce. We quote: Fancy white, 15c; No. 1, 14c; No. 2, 12½@13c; and buckwheat, from 10@12c. Extracted remains dull and inactive with plenty of supply of all kinds. In order to move round lots, it is even necessary to drop the quotations, which are: White, 6@6½c; amber, 5@5½c; dark, 4@4½c. Southern, 55¢@60¢ gallon, according to quality. Beeswax firm at 24c.

HILDRETH & SHELKEN.

CINCINNATI, Dec. 20.—The honey market is rather dull on account of the warm weather. Extracted sells only to manufacturers from 6@6½c; better grades about a water-which from 6@6½c; white clover from 5@5½c. Fancy white comb honey sells from 13½@15c.

C. H. W. WEBER.

ALBANY, N. Y., Dec. 20.—Honey in good demand now, as this is the most satisfactory time to sell. Growers are stacking up and will buy lines, when late they only buy enough to piece out. Fancy white comb, 15@16c; mixed, 14@15c; buckwheat, 12@13c. Extracted, white, 6½@7c; mixed, 6@6½c.

H. R. WRIGHT.

OMAHA, Dec. 20.—New comb honey is arriving by express in small quantities from Iowa and Colorado, and selling at \$3.50 per case in a retail way. California extracted honey is being offered carlots at 4½@4¾c per pound, f.o.b. California. The market is quiet, and it is probable that many of the sales have been made thus far. The production of extracted honey seems to be quite large this year in Colorado, Utah and California.

PEYCKE BROS.

BOSTON, Dec. 20.—The demand for honey is causing some delay in part to the holiday season at which time it is much neglected.

Our market at the present time runs 16c for strictly fancy in cartons; No. 1, 14@15c; No. 2, 13@14c. Extracted, light amber, 7@8c; amber, 7c.

BLAKE, SCOTT & LEE.

DES MOINES, Dec. 20.—There is very little doing here in new crop of honey. Some small lots of near-by produced comb honey are on the market and selling in a retail way at \$3.50 to \$3.75 per case. No one has yet looked for honey in this line before Sept. 1. Our market does not consume a great deal of extracted honey.

PEYCKE BROS. & CHANEY.

DETROIT, Dec. 20.—Fancy white comb honey, 14@15c; No. 1, 13@14c; no dark to quote. Extracted, white, 6@6½c. Beeswax, 25@26c.

M. H. HUNT & SON.

SAN FRANCISCO, Dec. 20.—White comb, 11@12½c; amber, 10@11c; dark, 6@7c. Extracted, white, 5½@6c; light amber, 4½@5c; amber, 4@4½c. Beeswax, 26@27c.

Not much doing in the center, but there are no large stocks here of any description, and current values are being, as a rule, well maintained. There is more moving outland at present from southern producing points than here. Some apiarists are reported holding back supplies, anticipating better prices in the spring.

KANSAS CITY, Dec. 20.—Up to the present time only small lots of new comb honey have been on the market, and the regular sale on the basis of 15¢ per pound for fancy white. For next week heavier receipts are expected and quotations are issued at \$3.10-\$3.25 per case for large lots, which would be equal to about 14¢@14½c; the demand being quite brisk, a firm market is anticipated. Inquiries for extracted are a little more numerous, but large buyers still seem to have their ideas too low. In a small way 5½¢@6c is quoted.

Texas Bee-Keepers.

New Branch Office. We beg to announce the opening of a branch office and warehouse at 438 W. Houston St., San Antonio, Texas. Rates of transportation from Medina in less than car-load lots are high, and it takes a long time for a local shipment to reach Southern Texas points.

**Low Freight and
Quick Delivery.**

To secure these two necessary advantages—low freight and quick delivery—and to be better prepared to serve the interests of our Texas friends, is our reason for establishing this new branch office. No other point in Southern Texas is better adapted to serve as a distributing point than San Antonio. It has four great railroads—the Southern Pacific R. R. east and West—the International and Great Northern R. R. from Laredo up through San Antonio and Central Texas, the San Antonio and Arkansas Pass R. R., and San Antonio and Gulf R. R. It also has the American, Wells-Fargo and Pacific Express Companies.

Our Managers.

We have secured as managers Mr. Udo Toepperwein, formerly of Leon Springs, and Mr. A. Y. Walton, Jr., both of whom are well known to bee-keepers of South and Central Texas. They are also thoroughly familiar with practical bee-keeping and all matters associated with it, and any orders sent to this branch will receive prompt, careful attention.

Our Goods.

As usual, our motto is to furnish the best goods of the most approved pattern. We do not undertake to compete in price with all manufacturers. Bee-keepers have learned that it does not pay to buy cheap supplies, for a saving of 10 cents on the first cost of a hive may be a loss of many times this amount by getting poorly made and ill-fitting material. Every year brings us many proofs that our policy of "the best goods" is a correct one.

Our Catalog.

Very few changes in prices will be made in our new catalog, so do not delay your order, but send it at once. You will be allowed a refund if lower prices are made, and in case of higher prices ruling in the new catalog, if any, you will secure the benefit by ordering now. Catalog and estimates may be had by applying to the address given below.

Our Invitation.

Whenever you visit San Antonio you are invited to call at our office and make it your headquarters. Here you will find a display of Apianian Supplies not equaled elsewhere in Texas. You will also find on file the leading bee-journals to pass pleasantly your leisure time.

Spanish Catalog.

Some of you may read Spanish, or have a bee-keeping friend who does. If so, call for our Spanish catalog. It's sent free.
